VOL. LXXIV—NO. 1905. THURSDAY, JANUARY 2, 1902. PRICE TEN CENTS.

"A book of interest to the general reader, a veritable text book for the collector, and in its magnificent illustrations an epitome of the history and development of Colonial furniture."
—Mail and Express.

COLONIAL FURNITURE in AMERICA

By LUKE VINCENT LOCKWOOD

300 illustrations including 12 artotypes

The NEW YORK TRIBUNE says:

"AT once a study and a guide book; a volume calculated to interest the general reader, and to be, moreover, of the most practical service to collectors whether the latter be well inured to the difficulties of the chase after good examples, or be in the first stages of their enthusiasm."

In one volume, a companion to Mumford's "Oriental Rugs"

$7.50 net. (Postage 60 cents.)

EUGENE FIELD

A STUDY IN HEREDITY AND CONTRADICTIONS

By SLASON THOMPSON, his friend and fellow-worker.

CHICAGO POST—"A graphic presentment of a personality singularly varied and picturesque."

N. Y. TIMES SATURDAY REVIEW—"Full of good stories and entirely readable."

MAIL AND EXPRESS—"The story of a good sinner, a sincere citizen, an excellent family man, a lover of pure fooling and of his kind."

BROOKLYN EAGLE—"A very realistic and convincing portrait, one that cannot fail to increase our knowledge of the man and still further endear him to the regard of those who know him only through the medium of his delightful pages."

In two profusely illustrated volumes with many hitherto unpublished verses and many reproductions of illustrations by Field, some of them in colors.

$3.00 net. (Postage 30 cents.)

Twelve Trains Daily Between New York and the South via Southern Railway.

The sunshine of popular favor has now settled upon the Southern Railway; they have made their system one of the great steel highways of the world.

The gratitude of tourists who appreciate the acme of luxury in railroad travel is due in no small measure to this system. Their line of operation is the great highway that leads to and through the Southern States. Year by year they have adopted every improvement that could add in any way to the comfort of that army of visitors who make their Winter home in the vast territory covered by its network of lines.

An example of the superb trains operated by the company is the "Southern's Palm Limited," which runs between New York and St. Augustine every day, except Sunday, during the Winter months. This magnificent train, the most luxurious in the world, runs through solid from New York to St. Augustine, excepting one drawing-room sleeping-car, which is detached at Blackville, S. C., and runs to Augusta, for the accommodation of travellers to this popular resort, and Aiken, S. C. The train is composed of Pullman compartment cars, drawing-room sleeping cars, library, observation and dining-cars. Other fast daily limited trains are operated, carrying through Pullman drawing-room sleeping-cars to New York, Savannah, Jacksonville, Tampa, Charleston, Augusta, Asheville, Chattanooga, Nashville, Atlanta, Birmingham, Memphis, New Orleans, affording excellent service to Florida, Mexico, and the Pacific Coast. Dining-car service on all through trains. For further information call or address New York Offices, 271 and 1185 Broadway. Alex S. Thweatt, E. P. A., 1185 Broadway, New York.

F. O. HOUGHTON & CO., Gen'l Agts., 115 State Street, Boston.

A Quaker Experiment in Government.

By ISAAC SHARPLESS, LL.D., President of Haverford College.

IT is long since a book on Quaker history has been issued which has even approached the popularity of this work. It has gone through three editions in as many years, and has received the weighty commendation of the learned and critical as well as the appreciation of the reading public. Extended by addition of a later volume to include the Revolutionary period, it became a complete History of Quaker Government in Pennsylvania, and has recently been sold under this title. The present edition of this work, the beautiful ***Haverford Edition,*** includes all the matter of earlier editions, together with a special preface and an appropriate concluding chapter. Handsomely illustrated with over forty full-page plates, beautifully printed on fine deckel-edged paper, and luxuriously bound, it is an ideal Christmas gift for any Quaker or any Haverfordian, or for any lover of fine books. *Half Morocco, $7.50; full Morocco, $10.00 net.*

New $1.75 Popular Edition. Early in 1902 we shall issue a new edition (the fourth) in a single volume, bound in cloth, at $1.75 net. This will contain all the matter of the two-volume edition (except the special matter of the Haverford Edition), and will be printed from the same plates, but on slightly thinner paper, to admit of its compression into one volume. We will receive ***prepaid subscriptions*** during December, 1901, for $1.50, to be delivered to the subscriber, carriage prepaid by the publishers, as soon as published. It will be ready about January 10.

FERRIS & LEACH, PUBLISHERS, 29 N. Seventh Street, PHILADELPHIA.

THE TIMES AND YOUNG MEN.

By Dr. Josiah Strong,
Author of "Our Country," "Expansion," etc.

12mo, Cloth, net, 75c

A simple philosophy of life for young people. Dr. Strong's position and style are well known. In this book he discusses the great social laws which must be obeyed if social ills are to cease, and applies these laws to the everyday problems in the lives of all young people

PHILADELPHIA, 421 Chestnut St.
MONTREAL, Canada Life Building.

Kansas City, Mo.

The present condition of Kansas City is exactly suitable for purchase of city property. Prices of to-day guarantee appreciable increase. There is no surer city in the United States for investors to make money in real estate. We have been identified with the real-estate interests of this city during its steadily healthy growth and would like to tell a few Eastern investors how others have made money here, and how any one with a reasonably unprejudiced mind can do the same.

Choice loans on hand for sale at 5 and 6 per cent. interest.

Our responsibility is unquestioned.

Thayer-Moore Brokerage Co.

AN OPPORTUNITY.

Would you consider an opportunity to secure *a permanent annual income* by investing your surplus capital in such sums as you might desire? If, moreover, you were afforded *perfect security* and the *assurance* of more than the average interest or dividends, would you invest?

If so, we simply ask you to investigate the proposition offered by the

Isthmus Plantation Association of Mexico.

Full particulars will be mailed you upon request,
C. M. KENDALL, Gen'l Agent, 414-417 First National Bank Building, Milwaukee, Wis.

CRUTCHER & WELSH

have for many years demonstrated to a large clientele that money was to be made in Kansas City Real Estate if it be conservatively selected and administered. Every facility for the care of non-resident estates. Property wisely purchased now is certain of steady advance. Our purpose is to serve faithfully and efficiently a few more Eastern clients. We are an essential part of the history of

A NEW GERMAN BOOK

Just Ready

THEODOR STORM'S "IMMENSEE"

Edited with Introduction and Notes, by RICHARD ALEXANDER VON MINCKWITZ and ANNE CROMBIE WILDER.

Mailing price, 50 cents.

GINN & COMPANY, Publishers
Boston, New York, Chicago, London.

LIMITED EDITIONS
of Standard English and French Authors.

On receipt of postal card specimens of paper, type, illustration and binding will be sent.
KNIGHT & BROWN, 150 Fifth Ave., New York.

THE **EQUITABLE**

"STRONGEST IN THE WORLD"

ON NEW YEAR'S DAY 1882

a young man took out 20 Year Endowment Policy No. 241,049 in the Equitable for $5,000— Annual Premium $247.45

ON NEW YEAR'S DAY 1902

he receives the Endowment in cash—and $2,523.45 in dividends—making in all

$7,523.45.

In addition, he has been assured for $5,000 for 20 Years.

Send coupon below for particulars of Endowment at your age.

THE EQUITABLE SOCIETY, Dept. No. 32
120 Broadway, New York.

Please send me information regarding an Endowment for $_____,
if issued to a man_____years of age.

Notable Books Issued During 1901

ADAMS AND STEPHENS. Select Documents of English Constitutional History. Edited by GEORGE B. ADAMS, Yale University, and H. MORSE STEPHENS, Cornell University. 12mo, cl., *net* $2.25.

BAILEY. Cyclopedia of American Horticulture. By L. H. BAILEY, Professor of Horticulture in Cornell University. Assisted by Many Expert Cultivators and Botanists. Illustrated. Vol. III. N-Q. 8vo, cl., sold only in sets of four volumes, ea. vol., *net* $5.00.

BALDWIN. Dictionary of Philosophy and Psychology. Edited by JAMES MARK BALDWIN, Ph.D., Princeton University, with the Co-operation and Assistance of an International Board of Consulting Editors. In Three Volumes. With Illustrations. Vol. I., 8vo, cl., *net* $5.00.

BENEFACTRESS, THE. By the author of "Elizabeth and her German Garden." 12mo, cl , $1.50.

BENSON. A Friend with the Countersign. By B. K. BENSON, Author of "Who Goes There?" 12mo, cl., $1.50

CALKINS. The Protozoa. By GARY N. CALKINS, Ph. D., Columbia University. (*Columbia University Biological Series, VI*), cl., *net*, $3.00.

CHURCHILL. The Crisis. By WINSTON CHURCHILL, author of "Richard Carvel," etc. With Illustrations by HOWARD CHANDLER CHRISTY. Cl., $1.50.

CLARK. The Control of Trusts. An Argument in Favor of Curbing the Power of Monopoly by a Natural Method. By JOHN BATES CLARK, Columbia University. 12mo. cl , *net* 60c

CODMAN. Arnold's Expedition to Quebec. By JOHN CODMAN, 2nd. 8vo, cl., *net* $2.25.

CRAWFORD. Marietta: A Maid of Venice. By F. MARION CRAWFORD. 12mo, cl , $1 50.

DAVIS. "God Wills It!" A Tale of the First Crusade. By WILLIAM STEARNS DAVIS, author of "A Friend of Cæsar." With Illustrations by LOUIS BETTS. 12mo, cl., $1 50.

DILKE. French Furniture and Decoration in the XVIIIth Century. By Lady DILKE, author of "French Painters of the XVIIIth Century," "French Architects and Sculptors of the XVIIIth Century," etc. Imp. 8vo, cl., $10.00. With Illustrations.

DIX. The Making of Christopher Ferringham. By BEULAH MARIE DIX, author of "Soldier Rigdale," etc. 12mo, cl., $1.50.

EARLE. Old-Time Gardens. Newly set forth by ALICE MORSE EARLE. A Book of the Sweet o' the Year. Profusely illustrated 12mo, cl., *net*, $2.50.

ESMARCH AND KOWALZIG. Surgical Technic. A Text-book on Operative Surgery. By FR. VON ESMARCH, M.D., and E KOWALZIG, M.D. Translated by Professor LUDWIG H. GRAU, Ph D., and WILLIAM N. SULLIVAN, M.D. Edited by NICHOLAS SENN. M.D. With 1497 illustrations 8vo, cl. *net*, $7.00. Hf. morocco, *net*, $8.00.

FAIRLIE. Municipal Administration. By JOHN A. FAIRLIE, Ph.D., University of Michigan 8vo, cloth, *net*, $3.00.

FREEMAN. Italian Sculpture of the Renaissance. By L. J. FREEMAN. Illustrated. 8vo, cloth, *net*, $3.00.

GARDEN (THE) OF A COMMUTER'S WIFE. Recorded by the Gardener. Illustrated. 12mo, cl., $1.50.

GIDDINGS. Inductive Sociology. A Syllabus of Methods, Analysis, and Classifications, and Provisionally Formulated Laws. By FRANKLIN H. GIDDINGS, Columbia University. 8vo, cl., *net*, $2.00.

GILBERT. The First Interpreters of Jesus. By GEORGE HOLLEY GILBERT, Ph.D., D.D., author of "The Revelation of Jesus," etc. 12mo, cl., *net*, $1.25.

GREEN. Letters of John Richard Green. Edited by LESLIE STEPHEN. 8vo., cl., *net*, $4.00.

GREENOUGH AND KITTREDGE. Words and Their Ways in English Speech. By JAMES B. GREENOUGH and GEORGE L. KITTREDGE, Harvard University. 12mo, cl., *net*, $1.10.

GUMMERE. The Beginnings of Poetry. By FRANCIS B. GUMMERE, Haverford College. 8vo, cl., *net*, $3.00.

HAPGOOD. George Washington. By NORMAN HAPGOOD, author of "Abraham Lincoln" 12mo, hf. mor., *net*, $1.75.

HARRISON. George Washington and Other American Addresses. By FREDERIC HARRISON, M.A. 12mo, cl., *net*, $1.75.

HART. The Foundations of American Foreign Policy. By ALBERT B. HART, Harvard University. 12mo, cl., *net*, $1.50.

——American History Told by Contemporaries. Vol. IV. Welding of the Nation, 1845-1900. 12mo, cloth, *net*, $2.00.

HERKOMER. Hubert von Herkomer, R. A. A Study and a Biography. By A. L. BALDRY, author of "Sir J. E. Millais, Bart, P.R.A." *Limited Edition.* Imp. 8vo, cl., *net*, $15.00.

HERRICK. The Real World. By ROBERT HERRICK, author of "The Web of Life," etc. 12mo, cl., $1.50.

HEWLETT. New Canterbury Tales. By MAURICE HEWLETT. 12mo, cl , $1.50.

HOWISON. The Limits of Evolution and Other Essays. Illustrating the Metaphysical Theory of Personal Idealism By G. H. HOWISON, LL.D., University of California. 12mo, cl., *net*, $1.60.

JOHNSON. The Isle of the Shamrock. Written and Illustrated by CLIFTON JOHNSON. 12mo, cl., *net*, $2 00.

LOWRIE. Monuments of the Early Church. By WALTER LOWRIE, M.A. 12mo. (*Handbooks of Archæology and Antiquities.*) Cloth, *net*, $1.75.

McCONNELL. The Evolution of Immortality. By S. D. McCONNELL, D D. 12mo, cloth, $1.25.

McCRADY. The History of South Carolina in the Revolution, 1775-1780. By EDWARD McCRADY, LL.D. 8vo, cloth, *net*, $3.50.

McCURDY. History, Prophecy and the Monuments; or, Israel and the Nations. By JAMES FREDERICK McCURDY, University College, Toronto. Volume III., completing the work. 8vo, cl., *net*, $3.00.

MERWIN-WEBSTER. Calumet "K." By MERWIN-WEBSTER, authors of "The Short Line War," etc With many Illustrations by HARRY C. EDWARDS. c. 6+345 p. 12mo. cl., $1.50.

MONROE. A Source Book of the History of Education for the Greek and Roman Period. By PAUL MONROE, Ph. D., Teachers College, Columbia University. Cloth, 12mo, *net*, $2.25

MORGAN. Regeneration. By THOMAS HUNT MORGAN, Ph.D., Bryn Mawr College. 8vo. (Columbia University Biological Series, VII.), cl , *net*, $3.00.

NICHOLSON. Principles of Political Economy. By J. SHIELD NICHOLSON. Vol. III., Books IV. and V. 8vo, cl., *net*, $3.00.

OVERTON. The Heritage of Unrest. By GWENDOLEN OVERTON. 12mo, $1.50.

RIIS. The Making of an American. An Autobiography. With Numerous Illustrations. By JACOB A. RIIS, author of "How the Other Half Lives." 8vo, cl., *net*, $2.00.

ROBERTS. The Anthracite Coal Industry. By PETER ROBERTS, Ph.D. 8vo, cl., *net*, $3 50.

ROYCE. The World and the Individual. Gifford Lecture. *Second Series.* **Nature, Man, and the Moral Order.** By JOSIAH ROYCE, Harvard University. 8vo, cl., *net*, $2.25.

SHAW. School Hygiene. By EDWARD R. SHAW, New York University. (*Teachers' Professional Library.*) 12mo, cl., *net*, $1.00.

STURGIS. A Dictionary of Architecture and Building. By RUSSELL STURGIS, and many Architects, Painters, Engineers, and other Expert Writers, American and Foreign. In Three Volumes. 8vo, cl., subs., sold only in sets, *net*, $18 Hf. morocco, *net*, $30.00.

TEMPLE POCKET BALZAC (The). Edited by GEORGE SAINTSBURY. In Forty Volumes. Sold only in sets. 16mo, cl., $30.00. Limp leath., $40.00.

TEMPLE POCKET BRONTE (The). In Twelve Volumes. 16mo, cl., ea., 50c. Limp leath., ea., 75c.

THACKERAY. The Prose Works of William Makepeace Thackeray. Illustrated.
Vanity Fair. 3 volumes $3.00.
Pendennis. 3 volumes $3.00.

TWEEDIE. Mexico as I Saw It. By Mrs. ALEC TWEEDIE. Illustrated, 8vo, cl., *net*, $5.00.

WILLIAMS. The Rœntgen Rays in Medicine and Surgery. By FRANCIS H. WILLIAMS, M.D. Illustrated. 8vo, cl., *net*, $6.00. Hf. morocco, *net*, $7 00.

WOOD. A Primer of Political Economy By S. T. WOOD. 12mo, cl., *net*, 50 cents.

THE MACMILLAN COMPANY, 66 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, JANUARY 2, 1902.

The Week.

President Roosevelt has shown that he had a clear conception of a particular type of man for head of the Treasury Department when he set out to find a successor for Secretary Gage. When Governor Crane of Massachusetts felt compelled to decline, the President turned to the Middle West, and sought a man who in two terms as Governor of Iowa had displayed similar traits and won like recognition throughout the country. Leslie M. Shaw came to the front in his State during the Presidential campaign of 1896. While many Republicans were inclined to "wabble" on the financial issue, and to dally with "bimetallism," he insisted upon preaching the gold standard. The people responded, as they always do to a man of convictions, and Mr. Shaw leaped into such prominence that he became the candidate of his party for the Governorship, a year later. No sooner was he installed in the Capitol than he began exerting his influence to secure reforms in the government of the State, and the first session of the Legislature under his leadership did such good work that it commanded the endorsement of even Democratic critics. The most important measure enacted was the Board of Control Law—a law which substituted for the many separate bodies of trustees and commissioners that had previously managed the various penal and charitable institutions, often in a lax and wasteful manner, one board of three members, who were to give all of their time to the work, and who could be held responsible for everything. The immediate result was a great saving in money and a large gain in efficiency, and each succeeding year has further vindicated the wisdom of the change. This reform illustrates the bent of the Governor's mind, and is a fair example of his work as a State Executive. The nation is now, for the first time, to have a Secretary of the Treasury who lives in a country town in the western part of a great agricultural State, lying beyond the Mississippi River.

There seems to be a hitch in the negotiations between our Government and that of Denmark respecting the purchase of the Danish Islands. The hitch is fortunate for both ourselves and the islanders. If we should buy them, we should lose the purchase-money, and add to our responsibilities and expenses for all future time. We should not attend to our responsibilities, or should attend to them only by fits and starts. The islanders have been close observers of our methods of dealing with colonies, and have not been favorably impressed. Their original desire for annexation has accordingly cooled. They find themselves much more attached to the mother country than they supposed they were. They do not want a change until they can better themselves. If we had treated Porto Rico as a part of the United States, and given her people citizenship and free trade at the outset, the temptation to the inhabitants of the Danish islands to come in would have been strong. But if they should come in now, by purchase or otherwise, nobody could predict what their future status would be. Neither we nor they could form any satisfactory judgment on that subject, any more than we can about the tariff on Cuban sugar or our future trade relations with the Philippines. The truth is that Uncle Sam does not know what to do with his new possessions. His position is aptly represented by the gyrations of his Supreme Court. Under such circumstances the fewer islands he attempts to govern the better will he be able to maintain his own dignity in the family of nations.

Already one Republican Senator is quoted as holding that the surrender of the Panama Company puts an entirely new aspect upon the whole question of an Isthmian canal. He maintains that there is no need of hurrying madly about the business, and that, if the French shareholders are now willing to sell their property at a reasonable price, it is the duty of the United States to look into the matter carefully, and not rashly commit itself to an inferior route, while at the same time squandering millions of dollars. Such sane opinions will be more numerous, we are convinced, when Congress comes to take up the canal bills. It cannot ignore the report of our own Commissioners, which so evidently favors the Panama location, provided the price were a fair one. The French stockholders will now come quickly to terms, unless they are crazy and wish to be ruined. The fair price is, therefore, almost certain to be forthcoming, and Congress cannot ignore the offer. The question is by no means "closed."

According to the *Sun's* Manila dispatches, there exists genuine friction between Gov. Taft and Gen. Chaffee over the situation in Luzon. The civilian, it seems, wishes to extend civil authority in every direction, while the soldier still sees the need of keeping up many small garrisons in the various provinces. A private letter from an able officer of the army, whose name has frequently been mentioned in reports and dispatches for his excellent work in the field, throws some light on the reasons for Gen. Chaffee's anxiety. "Southern Luzon," he says, "is still far from pacified. We do just as much 'hiking' as ever, and although the insurgents are not very aggressive, we expect them to show more activity about January 1, when the dry season begins. It is rumored now that Malvar has landed 5,000 new arms in the Camarines, and is prepared to give us a 'hot time' soon. Every fugitive from justice, every ne'er-do-weel has joined Malvar. I believe we shall ultimately have to adopt some system of reconcentration." Since the above letter was written, reconcentration, which means among other things warfare upon women and children, wherever tried, has been resorted to in Southern Luzon as well as in Samar. The writer also states that the natives fear the vengeance of their own people far more than the warfare of the Americans, and that the Filipinos who take the oath of allegiance continue to plot against their foreign oppressors.

The English protestants against the course of Great Britain in South Africa are in one respect in a much better situation than the Americans who are unalterably opposed to the Government's Philippine policy. Whether Parliament is in session or not, the English public is able to get more solid facts about the happenings in South Africa than the Americans obtain about the Philippines. The administration of the concentration camps, for instance, was greatly changed because of the publication, month after month, by the Government, of the official mortality statistics. So high did the death-rate become that the English people declined to permit matters to go on unaltered. Similarly, the English War Office publishes every month the total casualties since the beginning of the war, and includes not only those who have died at sea, but those whose deaths took place after their return home because of wounds or illness contracted in South Africa. The American War Department publishes just what it pleases, being subject to no such open cross-questioning as an English Under-Secretary meets in St. Stephen's. It has grown so niggardly that it will not allow Gen. Chaffee even to cable the deaths in his command, while complete tables of the American losses are never given out. As for the facts about military methods, and where the reconcentration is in force, and how many are the victims that it counts, the American citizen is simply referred to the daily press—that is, to the two correspondents of the great press associations in Manila. If they choose to suppress or overlook important news, why, the War Department is certainly not to blame!

The scheme for a Pan-American bank seems mainly designed as a sort of certificate of good municipal character. The first report read at Mexico recommended "that there be established in New York, San Francisco, New Orleans, Buenos Ayres, and other important commercial centres, a bank with branches in the principal cities of the American republics." Imagine the feelings of the inhabitants of places not fortunate enough to be mentioned in the resolution. At least one American city has had the spirit to rebel against such cavalier treatment. Chicago came forward in the person of an American delegate, to insist upon being added to the list of cities "having a claim" to one of the branches. Only the representatives of Bolivia and Ecuador were small enough to vote against this act of justice to Chicago, and their opposition was quite offset by the glowing tribute to her merits paid by a Chilian delegate—who, however, excused himself from voting. The conference will find the task of deciding between the claims of rival cities as difficult as the judgment of Paris, although, as the Pan-American Bank may never get beyond its present Platonic stage, the consequences will not be so disastrous.

The establishment of a chair of Chinese literature at Columbia constitutes no marked departure from tradition, since a university is by definition a place for the study of all branches of knowledge. But it appears from interviews with the founder, Gen. H. W. Carpentier, that the new professorship will have a practical as well as an academic function. It is clear that we are hereafter to be in closer trade relations with the Celestial Empire than in the past, and it is certainly desirable that those who represent this country in China should have not only some knowledge of things Chinese, but also a genuine respect for the Chinese mind and character. It is easy to see how, on the basis of this new foundation, there might be built up gradually a school of Eastern languages, at which not only scholars, but diplomatic and consular officials and representatives of commercial houses might fit themselves for their respective duties. A School of Living Oriental Languages at Paris fills this useful function, with no sacrifice of scholastic dignity. Educators will watch with interest the administration of Gen. Carpentier's far-sighted gift.

Why should the duty on works of art be continued, against the protest of all who are supposed to be benefited by it? For the artists, in whose behalf, presumably, the duty was reimposed in 1898, the noted painter John Alexander recently spoke before the Carnegie Institute at Pittsburgh, saying, "The true artist does not need protection, and does not want it." It has been made clear a thousand times that the tariff on works of art is actually to the artists' disadvantage, since it hinders the bringing over of great works of art the presence of which in the country would be most valuable to our artists. The Treasury could easily dispense with this duty. For the fiscal year ending June 30 last, the revenue from paintings and statuary amounted to less than $371,000, or about one-sixth of 1 per cent. of the total customs receipts for that year. What stands in the way of the reform is chiefly indifference. If representatives of the Art Societies would make it a point to see their respective Congressmen and Senators, this indifference might be broken, for it could be made plain that here no attack upon the protective principle and no attack upon the sacrosanct tariff lie concealed. Probably when the duties on objects of art were reimposed in the Dingley Bill, it was with the feeling that these are objects of luxury belonging to very wealthy people who can afford to pay for their luxuries. A little reasoning together of artists, collectors, and Congressmen should make it clear that this relegation of objects of art to the same category with champagne and cigars is unworthy of an enlightened nation.

Congressman McCleary of Minnesota has sent out a circular to some 2,400 presidents of national banks asking whether, in their judgment, it would be well to amend the national-bank act so as to permit national banks in the smaller places, where the clientèle of the banks is largely rural, to loan a portion of their resources on real-estate security. He does not express any opinion of his own on the subject, but merely seeks the opinions of bankers. He understands that strictly commercial banks should, so far as possible, keep their resources in the form of quick assets, leaving loans on real property to the savings banks and private lenders. "The larger cities," he says, "are provided with both kinds of banks, so that the people in such communities can secure in the appropriate place the kind of loans required; but in the smaller towns and villages these separate conveniences cannot be found. The bank, in the necessity of the situation, must perform both functions, and they all do so." As the national banking law does not allow loans on landed security, "the bank" to which Mr. McCleary here refers must be a State bank or private bank. Anything or anybody can be a bank in this free country, but a national bank that habitually lends money on mortgage can be and ought to be closed by the Comptroller of the Currency.

We see no objection to Mr. McCleary's circular, but we see very grave objections to any change in the national banking act in this particular. Lending money on real-estate security means long loans, and there is plenty of money to be had for long loans, but it is not commercial bank money. The latter is not composed chiefly of cash, but of credit. In order that the credit may be preserved, the assets of the bank must be within easy reach. They must be convertible into money within brief and definite periods. Loans on short time are only an aggravation to farmers. It is true that there are private money-lenders who put the word bank over their doors, and who do a mixed business, lending on both personal and real security. They take their risk, but they risk nothing that is not their own. The national bank that lends on farm lands or other real property risks the money of its shareholders and depositors and the reputation of the national banking system. All the reasons which decided Congress in 1864 to restrict loans to personal security are still in full force, and we can think of nothing in the whole system less likely to be changed. We apprehend that a clause permitting loans by national banks on real-estate security would profoundly modify the confidence of the business community in the system as a whole. It would certainly shake confidence in any particular bank that should avail itself of such permission.

It appears likely that the question of municipal ownership of street railways may be submitted to the voters at the next Chicago election. To obtain such a result, a petition signed by 104,000 voters is necessary, and of this number 50,000, it is reported, have already been secured. The movement is of special interest in the light of what has been done by the Street Railway Committee of the City Council. In recommending a plan for franchise extension, that body, three weeks ago, reported that "the immediate municipalization of the street railways of Chicago as a practical proposition, most persons will readily admit, is out of the question. The wisdom of such municipalization in the future is an open question." It is now believed that the effort to have the voters decide for or against municipal ownership is being urged by Mayor Harrison. Undoubtedly the whole franchise agitation has subjected him to heavy pressure. If the franchises should be extended without a plébiscite, advocates of municipal ownership would be inclined to grumble. Needless to say, the terms of the franchise grant will be severely criticised in any event. Whichever way the popular vote may go, it will relieve the Mayor of a burdensome responsibility. We do not think, however, that the voters of Chicago will approve the principle of municipalization. The verdict of the Committee is against it, and, as in-

vestigation shows, there is no sound reason for expecting much lower fares should it be adopted. The intelligence and good citizenship shown in the whole discussion of this question in Chicago are in pleasing contrast with the inertia of Philadelphia, at the time of the discreditable betrayal of the city's interests by Mayor Ashbridge.

Senator Daniel's resignation of his membership in the Virginia Constitutional Convention indicates that this body is approaching a crisis. Undoubtedly, the people of Virginia are thoroughly weary of the Convention and its protracted wrangles. During the past six months there has been little or no harmony among the members upon any of the proposed reforms. The fight over the judiciary question shows how bitter a contest may be provoked by even a minor issue. What is likely to happen when the report of the Suffrage Committee is received this month is accurately foreshadowed by Senator Daniel, who points out that the debates will prove a "political graveyard" to some of those who take part in them. The brunt of the suffrage battle will, in fact, rage about the so-called "understanding" clause. Both the majority and minority reports of the Committee would lengthen the voter's time of residence to two years in the State and one year in the county where his ballot is offered. Both would allow old soldiers to register, without distinction of the side on which they fought. Both would have substantially the same provisions regarding payment of certain taxes as a prerequisite to voting. The majority report would, however, erect a permanent board of registration in each magisterial district, armed with power to enforce a perpetual "understanding" clause, while the minority report would abolish this board after January 1, 1904. By that time, the moderates contend, the board would have been able to separate the sheep from the goats for the present. There will be strong opposition to the perpetual board, both from those who represent the poor whites and from an unexpectedly large number who favor more equitable treatment for the blacks. Senator Daniel's withdrawal may be the better part of valor, but it lacks dignity, as a certain form of prudence always does.

Two good men mutually misunderstanding each other and generally misunderstood—that is the painful spectacle which Mr. Perry Belmont and Mr. Croker present to the voters of the Seventh Congressional District. They appear to differ about the number of times that the candidate visited the boss at the Democratic Club, but this is really unimportant. Mr. Croker speaks, in his large way, about Mr. Belmont's having sought him out "a hundred times," and having, in fact, "nearly bothered me to death about his candidacy"; whereas Mr. Belmont confesses to only three visits, and those "at long intervals." The important thing, however, was the object the candidate had in calling. Croker says it was to secure his support; not so, says Mr. Belmont, it was solely to insure the boss's enmity, which he now proudly wears in his button-hole, and reckons to be worth many votes. Evidently, if Croker had known why Belmont came to see him, the little unpleasantness between the two would never have arisen; they would have continued the best of friends if it had only been clear that they were hob-nobbing in order to become enemies.

Ever since ex-Mayor Grant's Christmas gifts, amounting to $10,000, to Miss Flossie Croker were revealed to an unsympathetic world, a dozen years ago, the question of giving between political associates has been fairly open to discussion. As in the case of Mr. Grant in 1890, the fact that Mr. Belmont had made a Christmas gift to the son of a political supporter transpires under pressure from the enemy. Mr. Grant, however, was able to explain his gift gracefully by his godfatherly relation to Miss Flossie, while Mr. Belmont offers such an explanation and apology as have rarely been put forth in the Christmas-tide. He gave, he admits, an oil painting, by an artist whose name he fails to recall, to Mr. Edward Muller, the son of the Democratic leader of Richmond. But this painting, which Mr. Belmont's enemies believe to be of great price—*ignotum pro magnifico*—Mr. Belmont, who is a connoisseur, asserts is a thing of little worth. To be exact, it is worth $200; it is the kind of picture which a man might own, but the possession of which he could hardly value; it is very like a picture in Mr. Edward Muller's collection; in short it is just the kind of a picture that a candidate would be glad to give away in a friendly spirit to a political supporter. Such, in effect, is Mr. Belmont's explanation, which we gladly accept, acquitting him of any intention to win over the Richmond leader through the corrupting influences of art; but Mr. Belmont's not wholly graceful exit from the affair suggests that there is danger in departing from the conventional Christmas gifts prescribed by Tammany tradition.

The theory that the Monroe Doctrine will compel the United States to interfere with Germany in its efforts to collect a claim from Venezuela, is too ridiculous for the most earnest defenders of the Doctrine to maintain. The *Tribune* can always be depended upon to see that this "venerable and beneficent instrument," as it is affectionately styled, shall suffer no harm, and the *Tribune* flatly declares that Germany's conduct will not do it the slightest despite. Our contemporary points out that the Doctrine "is not and never was a charter of international libertinism," and that "it is not to be used as a screen for refractory and contumacious debtors." In short, it insists that the Doctrine has nothing to do with the case, as our Government understands that case. Under such conditions, an attempt to get up a war scare is as silly as it is unjustifiable.

Through a shrewd manœuvre of that canny Scott Sir Henry Campbell-Bannerman, Lord Rosebery in his solitary furrow is in some danger of appearing ridiculous. In his widely heralded Chesterfield speech, Lord Rosebery emerged momentarily from his ivory tower, and reminded the Liberals that, whenever they might need a leader to bring them out of their present discomfiture, the leader would not, through Lord Rosebery's fault, at least, fail to appear. The present Liberal leader, Sir Henry Campbell-Bannerman, simply and cruelly takes Lord Rosebery at his word. "Come back to our shattered forces," he says in effect; "and since you believe that our present leaders are unskilful or perverse, rally our forlorn hope yourself. Let the Liberals choose between you and me, and abide by the result." Of course, this invitation is less fair than it seems, for Campbell-Bannerman runs the Liberal machine. Yet the invitation quite strips Rosebery of all pretension to be a coming saviour of the Liberal party, and puts him either in the invidious position of a fisher, for his own profit, in troubled waters, or in the somewhat ridiculous attitude of a literary nobleman who, under cover of a great political meeting, has contrived merely to free his mind.

A Society for the Suppression of Alcoholism met recently in Breslau to consider the drink question in Germany. The Empire, it appears, spends $750,000,000 a year on drink, as against $3,000,000,000 for food. A Munich employer of many skilled workmen, in speaking last summer of the difficulties of competing with foreign and even North German concerns, laid stress upon the cheapness of Munich beer as one of his greatest handicaps. "If we were on equal terms in every other respect," he said, "the fact that my men's brains and bodies are sodden with beer, day and night, would put me behind in the race." So serious has the drawback of beer-drinking workingmen in Germany become, and so thoroughly is it recognized, that a movement has been started to exclude the drink from the factory premises.

THE EFFECTIVENESS OF SUBSIDIES.

Any candid man must admit that many causes tended to the commercial supremacy of England in the middle of the last century, and that this commercial supremacy involved the supremacy of her merchant marine. When steam first came in to draw the ends of the earth nearer together, England at once took advantage of the quickened mode of transit. She made mail contracts with the Cunard Line to Halifax and Boston; with the Peninsular and Oriental Company, first, to Gibraltar and later to Egypt, India, China, and Australia; and with the Royal Mail Packet Company to Spain, the Madeiras, the West Indies, and Colon, connecting at the latter place (via Panama) with the Pacific Steam Navigation Company to Valparaiso. But England did not acquire ships for the mere purpose of having them, nor, indeed, for the primary purpose of fostering shipbuilding. With England it was, in those early days, a case of paying for steam communication and mail service or going without it. Ocean steam navigation was then an experiment, and Great Britain's colonial relations made it a political necessity for her to try the experiment first. Her statesmen were forced to take the burden of risks which no private individual could prudently bear. Her supplies of coal and iron, her growing manufacturing interests, her imports of food and raw materials, and export of finished products, all contributed to the development of her merchant marine. The interests of the merchants of India, the manufacturers of Manchester, the colonists of Canada, as well as of the bankers of London, required that the British merchant marine should continue with the new motive power, steam, to be as powerful as it had been with sail.

What England's policy was earlier in the century, that has been the policy of Germany during the last twenty years. Germany has been every bit as envious as America of England's supremacy, and, like America, Germany has succeeded in obtaining a large share of the world's commerce. She has steadily followed in England's footsteps, has acquired colonies, built up her commerce, and developed her industries. But, in the matter of shipping, Germany has been wiser than America. Her motto has been that half a loaf is better than no bread; and if, at first, she could not build her own ships, she was willing to let England build them and hoist her own flag over them. Thus, the *Normannia*, which, not so long ago, held the record for speed across the Atlantic, and made the German flag known all over the United States, was built on the Clyde. Many other German ships have been and still are built in British yards. By pursuing this liberal policy, Germany has, after all, attained the very object for which America is striving—that is, the building up of her own yards; for the last two ocean greyhounds, the *Kaiser Wilhelm der Grosse* and the *Deutschland*, were both built on the Baltic, in the yards of the Vulcan Shipbuilding Company, at Stettin. The result of all this is that Germany's steam merchant marine to-day is second only to that of England.

The flourishing condition of the merchant marines of England and Germany is attributed by many people to the payments made by those countries for the transportation of mails, or as direct subsidies. These payments, in the case of England, amount to about $5,000,000 yearly, and are, with the exception of about $325,000 Admiralty subventions, for actual service rendered by the steamship companies as mail-carriers. The amounts paid, for instance, to the Cunard and White Star Lines for the British fiscal year 1901, according to official figures, were: For British mails to New York, $556,553; for Admiralty subventions, $142,403—*i. e.*, for a semi-weekly service, a total of $698,956, and an average for 104 voyages of $6,720.73 per voyage. The actual operating expenses of one of the large first-class steamers of these companies, for the round trip, are about $75,000. This leaves a balance of more than $68,000 to be earned in passage money (for the large transatlantic liners, it must be remembered, carry very little freight). Moreover, the travelling season, when the companies can count on every berth being sold out, is very short, and even then a steamer has a full passenger list only in one direction, for the tide of travel in the spring and summer is mostly eastward, and in the autumn westward. But the liner under mail contract must nevertheless maintain dates throughout the year, even in the dullest winter season, when passengers are few and rates are low. Thus these enforced winter trips consume a good deal of the profits of the summer, which would otherwise go to the credit of the steamer's account. On the other hand, a line not under a mail contract is free to cancel a date which does not promise to be lucrative, and take advantage of the dulness of trade to give steamers the necessary annual overhauling, or put them on a more lucrative route. A mail contract, then, is not an unmitigated blessing.

If subsidies were as beneficial as many assert they are, it would seem that subsidized lines should be more successful than unsubsidized ones; but in England the progress of the latter compares favorably with the progress of the former. The Bibby Line, unsubsidized, to Farther India, has successfully competed with the Peninsular and Oriental Company. In Germany, too, the Hamburg-American Line successfully competed with the North German Lloyd, for the first fifty years of its existence, without a cent of subsidy, and only recently entered into a mail contract, jointly with the North German Lloyd, to East Asia. The Hamburg-American Line's share of this contract, for the last business year, amounted to only $65,000. This amount, according to the published statement of the Director General of the line, Mr. Albert Ballin, left no profit, owing to the numerous requirements of the contract as to the high class of vessels, speed, itinerary, etc. Among other successful unsubsidized lines may be mentioned the Atlantic Transport Line (controlled by American capital, sailed under the British flag), the Leyland Line, lately acquired by American capital represented by Mr. J. Pierpont Morgan, and the Holland-America Line. The last of these, according to the report of the Commissioner of Navigation, paid a dividend of 10 per cent. in the fiscal year 1899-00.

The countries mentioned, England and Germany, are those usually cited by the American advocates of subsidies. But the country in which subsidies have been paid most freely is France. Mr. Bates, in his 'American Marine,' says: "The shipping protection given by the Republic of France, being general, is the very best foreign example, if we need one." What is the example of France? Commencing in 1861 with subsidies of 9,300,000 francs, or $1,860,000, she has increased these payments from time to time, until the total, according to the French budget for 1901, is $9,000,000 for the current year (including bounties on construction and navigation and mail payments). For this vast sum of money France has now a steam merchant-marine of only 1,068,036 tons—not as large as that of America.

By the law of 1881, which lasted for ten years, France initiated a policy of bounties upon shipbuilding and also upon navigation in native and *in foreign bottoms*, in addition to the regular subventions for postal services. The immediate effect of this law was an increase in the number of ships sailing under the French flag, and a corresponding increase in the construction and navigation bounties paid out by the Government. In 1889 the total had reached $7,000,000 annually, and has remained at that figure, or higher, ever since. This increase in tonnage, however, did not mean a corresponding increase in French shipbuilding, for the French ship-owners seem to have been able to buy foreign ships to better advantage, despite the bounty the native shipbuilder received, and despite the fact that the navigation bounty for native-built ships was twice as much as that for foreign ones. Another noteworthy point is, that, as the term of expiration of this law approached, the ship-owners, uncertain whether the bounty would be continued, ceased increasing their fleet. They seemed, then, to regard the continued payment of the bounty as a *sine qua non* of the life of the French merchant-

marine. The most ardent advocates of subsidies in America have always avowed that the payments proposed were only a temporary measure.

By the law of 1893 France abolished the bounty on boats of foreign build, but at the same time increased the payments for construction and navigation of native bottoms, and also renewed the liberal postal contracts. Her steam tonnage then was 855,798; in 1901 it was 1,068,036. During these nine years the payments made under the law mentioned averaged $7,500,000 yearly. Almost coincident with the passage of this law was the American act of 1892, establishing the American Line. The subjoined table of figures since that date* may be interesting. It is compiled from the annual report of the United States Commissioner of Navigation, 1901, and Lloyd's Register. The tonnage given is *gross*, and includes steamers exceeding 100 tons. The tonnage for the United States includes lake and ocean steamers of the same capacity. The mail payments for the United States are for the carriage of mail by United States steamers *to foreign countries* only. (The steam tonnage of the United States registered for the foreign trade on June 30, 1901, was 429,722 tons.)

In the table below, the most interesting column is that referring to Sweden and Norway. This monarchy has a marine greater than that of France, but it pays only about $175,000 per annum for subsidies and mail contracts, and part of this amount goes to foreign vessels not included in the tonnage given. Sweden and Norway have neither the colonies of England, France, or Germany, nor the outlying territory of the United States; their commerce, compared with that of those countries, is small; but of the ships which entered Swedish and Norwegian ports in 1900 in the foreign trade, two-thirds were native bottoms.

To sum up, in the two examples most frequently cited by the advocates of subsidies—England and Germany—other causes, more effective than subsidies, were at work to build up the marines of those countries, viz., great natural advantages, native industry, foreign commerce, and liberal navigation laws. Moreover, the lines subsidized by those countries have not prospered to any greater extent, for reasons shown, than lines which were unsubsidized. In France, where heavy subsidies have been paid for forty years past, the merchant-marine has, for a long time, practically stood still. The monarchy of Sweden and Norway, which grants subsidies and mail contracts of only a trifling amount, owns a steam tonnage greater than that of France. In view of these facts, it does not seem that the examples of European countries may be taken as arguments in favor of a general subsidized merchant marine.

THE LOW ADMINISTRATION.

Mr. Low has practically completed the organization of the government which, under his direction, will conduct the affairs of this city during the next two years. Of his last eight appointees, three are representatives of the Citizens' Union, three are Democrats, and two are Republicans, and they are fully up to the standard of those previously selected. The non-partisan character which Mr. Low has given to his appointments from the beginning is thus maintained in these last selections. Of the thirty-one offices filled so far, fifteen have gone to Republicans, eleven to Democrats, and five to members of the Citizens' Union. Still more notable is the fact that only six of the fifteen Republicans are recognized as men closely affiliated with the local Republican machine. Three of Mr. Low's Democratic appointments are of men who voted against him. These facts should allay the fears of people who declined to vote for Mr. Low because, in their imaginations, he merely stood for Senator Platt.

Taking the selections as a whole, it is not too much to say that no municipal government has ever gone into office in this country composed of men of higher character. From the outset Mr. Low gave his word that merit and fitness should be the sole tests for his appointees, and he seems to have lived up to his pledge, even though he has met with a number of disappointments in the refusal of several "first choices" to sacrifice their personal interests in order to accept office. In saying this we do not mean to assert that Mr. Low's government is to be a perfect one. Since his selections are, after all, only human beings, many of whom have had little or no experience with the dangers and difficulties of important administrative offices, it is altogether likely that there will be plenty of mistakes made between January 1, 1902, and December 31, 1903. But the fact remains that Mr. Low has given the most reliable surety for the proper administration of the city government by choosing the best men that he could get, and men who are thoroughly in sympathy with the fundamental doctrine that the city is to be ruled in the interests of all its inhabitants, and not in those of its office-holders.

The guiding principle of Tammany Hall in filling offices was frequently, if not always, the idea of "taking care" of men who were unable to earn their own living in business or in the professions. So far as we are informed, there is not one of Mr. Low's selections who has failed to make an honorable place in the community for himself by his own efforts. The only man on the list who has held office frequently is Col. Partridge. He has earned this distinction, not by favor of a district leader or a boss, or as a result of party servility, but because he has made himself indispensable to the Executives of city or State who wished to have an honest and fearless department head, of experience and training.

In most of the administrations of the city during the last fifty years, special fitness for office has been altogether ignored. The scientist who, like Dr. Biggs of the bacteriological laboratory, retained his office under a Tammany administration, did so because no Tammany heeler wanted the "job," or because of other unusual circumstances. Mr. Low has never lost sight of the fact that special duties require special training. For Tenement-House Commissioner he selected the man with the broadest knowledge of tenement-house conditions. For Charities Commissioner he chose a man whose life work has been the problem of private and public charity. To the office of Police Commissioner he appointed a man who had been the head of the Police Department of a large portion of the city. As his Corporation Counsel he took a lawyer of wide reputation in his profession, who had helped to draw the very charter which he will be called upon to interpret. Where he was not able to find a man to head a department who had been trained in similar work, he selected

one of broad scientific training, such as implied his successful mastery of the problem assigned to him. Dr. Woodbury, the new Street-Cleaning Commissioner, is of this type, while Dr. Lederle, the Health Commissioner, illustrates Mr. Low's desire to promote a faithful subordinate official to the head of the department in which he has served.

Mr. Low's policy in these matters must commend itself to all concerned, and make any future return to the "Mike" Murphy, the Percy Nagle, and the John J. Scannell type of public officer seem even more monstrous and uncivilized than hitherto. So Mr. Low's frank taking of the public into his confidence as to the reasons for his appointments will make any return to the old method of "government under a blanket" more difficult than in the past. Tammany's administration of the Street-Cleaning Department, bad and corrupt as it has been, has still been more effective than the work of Col. Waring's predecessors. The Waring standard has not been without its effect even upon Tammany Hall.

There have been some doubts expressed whether a government like Mr. Low's, formed largely of specialists and of representatives of what are often called, for want of a more proper term, the "better classes," will not lose touch with the masses, and so bring about a relapse into the old barbaric Croker methods at the end of two years. To these fears the reply must be that the development of a modern municipality makes the services of specialists or of men of large affairs indispensable. The safest way of preventing a return to Tammany government is by giving an administration which is so indubitably honest and so sincerely devoted to the interests of the "plain people" that no citizen can have any doubt upon those points, whatever mistakes of judgment may be made. The failure of the Strong administration to inspire confidence in these respects was largely the cause of Tammany's success in 1897. The approval with which Mr. Low's appointments have been received by the various parties to the fusion movement, as well as their excellent character and his own high motives, afford ground for the belief that every honest citizen will recognize in 1903 the necessity for the continuance of government of this type.

PUBLICITY OF ACCOUNTS ABROAD.

President Roosevelt's recommendation of enforced publicity in the accounts of corporations, followed up as it was by the introduction of Representative Littlefield's bill to compass that end, gives pertinence to a survey of what other countries are doing in this way. Corporation law on the Continent has always been much more rigid and precise than in England or the United States. The German Corporations Act provides for securing an inquiry at the outset into the circumstances of the promotion of every incorporated company. One of the first duties of directors is to send out a formal report on this subject, and, in case any of the directors have had a hand in promoting the company, another report, prepared by independent auditors, must be issued. Capital stock must be fully paid in cash or in property at a fair value. The articles of incorporation must state the number and kind of shares to be issued, and no permission for subsequent "Increase of stock" is granted. Publicity is secured by minute provisions for stockholders' meetings and for regular reports to them.

French law is quite as explicit. It deals with the full payment of capital as a preliminary to business in nearly as rigid a way as the German law, and, if anything, it is more elaborate in its requirement of publicity. Not only does it contain regulations like those in the German law, but it furnishes a means for revision of the annual reports by the stockholders, and orders the publication of the articles of incorporation and by-laws in every locality where the concern operates. Corporations must furnish to the Government information about their transactions upon demand.

With such an enforcement of publicity and responsibility, organization under corporate form would, in any case, naturally have proceeded more slowly on the Continent than in the United States or England. The trouble there has not been owing to looseness in corporation law, so much as to difficulty in inducing the Trusts to assume corporate form. This difficulty has, however, been partly due to outside influences. An attitude towards Trusts entirely different from ours has been adopted by Continental governments. In Germany, for example, they have been officially recognized in certain ways, and have been assisted in maintaining their monopoly. This does not refer merely to protective tariff duties. The general policy of protection for all industries in need of assistance against outside competition has been coupled with a willingness to see internal competition destroyed. Thus, Prussia has practically recognized the existence of the Coal Trust, and has made agreements with it for supplying fuel to state railways. In a similar fashion, the Trust of locomotive manufacturers has dealt directly with the Government. In this latter instance the Trust is not merely recognized, but practically created, by the state. Public authority in Germany has, in fact, not only failed to hinder the Trust movement, but has favored it, seeming to see in it a legitimate extension of the protectionist policy.

This state of things has for some time been looked at askance by consumers, who now wish to know what the Trusts are doing, and to that end desire to see them subjected to corporation law. And, in spite of the already minute and extensive provisions of that law, there has been a growing demand throughout Europe for stricter control. The leaders of the German anti-Trust movement are particularly explicit. They ask that all Trusts or other commercial organizations shall furnish to the Government information concerning the nature of their operations, and that this shall be published, with data showing the effect of combinations upon prices and wages. They insist that all combinations shall be required to organize under the corporation law. And, finally, some even urge that monopolies shall be supervised by the state, their prices fixed, and their profits above a fair rate of interest taken from them by taxation.

That this latter demand is extreme, is apparent. It does not gain large support, even in Germany. Just how far conservative Continental opinion is willing to go in this matter of corporation control may, however, be seen in the "Actien regulation," issued by the Austrian Ministry of the Interior in 1899, for the control of all commercial corporations, exclusive of banks, insurance companies, and railways, which operate under special charter. Not only does this act revise the whole Austrian corporation law, but it is particularly clear in prescribing publicity and full payment of capital stock by means of assuring equitable dealing. According to the new order, the mode of paying capital stock—whether in cash or in property—must be specified in the articles of incorporation, and only in a certain limited number of cases may it be paid otherwise than in cash. When paid in property, such property can be accepted only at its fair market value. The stock may not be issued below par, and must be fully paid up *before* the company begins business. Directors are required to see that the necessary books are kept. At the close of each business year, there must be a statement of profit or loss. The principles upon which this balance-sheet is prepared must be specified in the by-laws of the corporation, and a full account of all assets and liabilities, according to value, must be made public. Property that has deteriorated since it was acquired is to be inventoried, and each piece valued at a proper discount. This report must be furnished to all stockholders each year by the directors. Furthermore, a reserve must be established, by laying aside annually 1-20 of the net profits of the company, in order to guard against losses. Finally, all information about the enterprise, its earnings, etc., is to be certified to the local authorities, and by them sent to the Ministry of the Interior.

It may be suspected that the tendency toward regulation of corporations is to

be found only in bureaucratic Germany or official-ridden Austria. Such, however, is not the case. The same movement is powerful in England, as is shown by the bill of 1897 to amend the Companies Acts. This measure contains many features which anticipate the Austrian order of 1899. It provides for a stockholders' annual balance-sheet, stating assets and liabilities at true valuations, and erects a system of audit for testing the accuracy of these reports. If the Austrian order corresponds to what Mr. James B. Dill calls "public publicity," the English bill of 1897 represents his "private publicity."

CLARENCE KING.

Clarence King, widely known during many years past as a geologist and mining expert of the highest distinction, died on Tuesday morning, December 24, at Phœnix, Arizona, whither he went to reside some months since, in the hope that he might there recover from an attack of consumption, or some related malady of the lungs, which, as he believed, he had contracted during a journey in the Klondike some time during the previous year. His body will be brought East for interment at Newport, R. I., his birthplace and family home, where his mother, Mrs. Florence King Howland, still lives to lament his loss.

King was born January 6, 1842, and had nearly completed his sixtieth year. He passed a part of his boyhood at school in Hartford, Conn., and studied later at the Sheffield Scientific School, at Yale, where he was graduated in 1862. He went to California in 1863, crossing the plains on horseback with an emigrant train, studying the geology of the country as he passed through it, and, by intelligent and scientific observation, developing the ideal conceptions which resulted, a few years later, in the geological exploration of that region by a Government expedition under his own direction. In California, King served for several years on the State Geological Survey, under Prof. J. D. Whitney, achieving distinction in various ways, notably in the high Sierra, where he climbed and measured the summits of greatest altitude, and gave the name of Mount Whitney to the highest peak of the range. His experiences of that period are recorded in his 'Mountaineering in the Sierra Nevada,' a work of rare literary excellence and charm.

During the winter of 1866-67, Mr. King successfully accomplished the object of a long visit at Washington, in securing the organization of the United States Geological Exploration of the Fortieth Parallel, under his direction as geologist in charge, subject to the supervision of Major-Gen. A. A. Humphreys, at that time Chief of Engineers of the United States Army. This was a scientific work of great importance and practical value, requiring many years' service of a large corps of able assistants, the results of whose labors were published by the Engineer Bureau in a report comprising several large volumes with accompanying maps and illustrations, covering the topography, geology, and natural history of a cross-section of the country lying along the fortieth parallel of latitude, and reaching from the eastern slope of the Rocky Mountains to the western slope of the Sierra Nevada.

One very notable and highly sensational result of Mr. King's work on the fortieth-parallel exploration, and one which gave him much fame both in this country and elsewhere, was his startling discovery of the great swindle in the "salted" diamond fields of Wyoming, late in 1872. Early in that year it had been noised abroad that a great find of diamonds and other precious stones had been discovered somewhere in the far West, presumably in Arizona, although the precise locality was most carefully concealed. A large number of the gems, unquestionably of considerable value, had been carried from the alleged fields to San Francisco and New York, where the most influential capitalists, who had been led to believe the favorable reports thus far presented, had invested large sums of money in the purchase of the ground said to be diamond-bearing, and were preparing for the intended operation of the so-called mines on a large scale, which would soon have caused a rush of fortune-hunters and adventurers comparable to the California immigration in '49 and '50. Through information gained by one of his assistants, it suddenly came to Mr. King's knowledge that the locality of the alleged diamond find was not in Arizona, but in Wyoming, and really within the region of his own field work of the fortieth-parallel survey. Not then suspecting a fraud, but, on the contrary, having good reason to regard as trustworthy the favorable reports of one or more well-known engineers who, shortly before, had visited the fields with the leading promoters of the enterprise, Mr. King hastened to the designated locality, not with the expectation of unearthing a swindle, but for the purpose of studying the new diamond field, and making his official report on what then seemed to be a discovery of great national importance.

He set out promptly with two or three assistants, and duly reached his destination, following the trail without difficulty from a station of the Union Pacific Railroad in Wyoming. He soon found diamonds and rubies in abundance, but his suspicions were quickly aroused by the observation that the plainly visible precious stones lay directly upon the hard surface of rock, where Nature alone could never have placed or left them, and that none could be found in the earth or on the underlying bedrock, where, had the occurrence been genuine, the inevitable laws of Nature must have carried them; with the further observation that the ant-hills, built of small pebbles mined by the ants, which were found to bear rubies on their surfaces or in holes (artificially made with a small stick), invariably showed in close proximity the storm-worn footprints of mankind, while the other ant-hills, without such sign of human tracks, and not pierced by any artificial holes, were also without rubies or precious stones of any sort. Thorough investigation, following the lines indicated by these suspicions, soon proved beyond any doubt that some designing hand had "salted" the ground with deliberate fraudulent intent.

This disclosure created a great sensation in this country and in Europe, whence evidence was soon forthcoming that the stones used in the salting had been bought in large quantities at London and Paris during the preceding winter, presumably by the originators of the swindle. The practical result of Mr. King's disclosure of the facts in this case was one of inestimable value, possibly more in money than the whole cost of the entire exploration of the fortieth-parallel expedition. Had the fraud remained undisclosed till the following spring, large sums of money would have been wasted in the costly purchase of worthless property and in fruitless prospecting, not only by capitalists, but by thousands of disappointed and ruined fortune-seekers.

The leading and most active, even though wholly innocent, promoter of the diamond-mining enterprise, by no means necessarily a participant in the original swindle or cognizant of the fraud until disclosed by King, was a very well-known native Californian, one of the earliest gold-seekers, and a lifelong projector and operator of mining schemes, whose name has ever since been more or less intimately associated with this celebrated case of diamond-salting. It is a notably curious coincidence that these two men—Roberts, who helped blow the bubble, and King, who caused it to vanish—should depart this life on the same day and at nearly the same time, twenty-nine years after the events in which they were thus concerned and so strangely related. Within two or three hours after King's death in Arizona, Roberts died in New York city. Their names and their death announcements, with obituary notices, stand closely side by side in parallel and adjoining columns of the *Times* newspaper of Wednesday, Christmas morning.

After the completion of his work on the fortieth-parallel exploration, Mr. King undertook the organization of the United States Geological Survey, as now existing, and became its first director, remaining in this service several years, after which he resigned, in order to give needed attention to various enterprises in which he had become interested or professionally engaged. Since that time he had followed his profession more or less closely until disabled by his last illness, mainly in the directing of large mining or other business enterprises in the Western and Southwestern States and Mexico, and also as skilled adviser in the practical applications of scientific knowledge, having in later years been much engaged as expert in very important mining litigations. Meantime, he also devoted much time and effort to purely scientific research and study, and made some very important contributions to knowledge and to the current literature of the period, especially in the field of physical geology.

Although Mr. King gained his highest distinction in scientific pursuits, he would undoubtedly have achieved great eminence in any other vocation which he might have chosen. He possessed marvellous intellectual versatility, and seemed to be endowed with the gift of genius, especially in the æsthetic faculty. In all matters of taste and beauty his perceptions were clear and fine, and his judgment was just. He excelled especially as a critic, both in art and in literature, possessing a brilliant mind, quick in intelligent apprehension, with a sparkling wit always bubbling over, great facility in thought, and rare felicity in expression. In conversation, whether grave or gay, he was a delightful companion. He was a man of charming personal-

ity, of noble and gentle spirit, a most kind, generous, and constant friend, whose loss will be lamented by many of all sorts and conditions of men, both in the very highest and the very humblest walks of life, as of one upon whose like they may never look again. J. D. H.

M. BERTHELOT.

ITHACA, December 23, 1901.

Visitors to Paris who have frequented the Latin Quarter must often have met, somewhere on the way between the Institute and the Collège de France, a little bent old man, with one shoulder higher than the other, wearing a long, black coat, no longer new, hanging loosely about his slender figure. With short, quick steps he makes his way along the narrow sidewalks of the Rue Mazarine and the Rue de l'École de Médecine, elbowed by passers-by who do not even turn to look at him, and who take him, no doubt, for some ancient clerk hurrying to his office. In reality, this ancient clerk is a professor going to his lecture-room. The little shabbily dressed old man, with the gently meditative expression and the acute, ironic glance, is beyond question the greatest living French scientist—a professor in the Collège de France, a member of the Academy of Sciences, the Academy of Medicine, and of the French Academy, a member for life of the Senate, an ex-Minister, and a member of almost all the learned societies of Europe—Marcellin Berthelot.

A few weeks ago Berthelot's disciples and admirers assembled in the huge amphitheatre of the Sorbonne to celebrate the fiftieth anniversary of the great chemist's entrance upon his scientific career. It was on May 27, 1850, that M. Berthelot presented to the Academy of Sciences his first memoir, upon the liquefaction of gases; and it was on February 23, 1851, that he was appointed to his first academic position, that of Assistant in Chemistry at the Collège de France. Since that time he has, without interruption, published memoirs and delivered courses of lectures, and may be said to have reconstituted the science of chemistry in France. The audience at the Sorbonne was of the same nature as that which, nine years ago in the same place, acclaimed and honored Pasteur. The President of the Republic presided, assisted by the entire Cabinet, by representatives of all the departments of the Government, and by delegates from the learned societies of France and of foreign nations. Addresses were delivered by M. Leygues, the Minister of Public Instruction; by Messrs. Darboux, Moissan, and Fouqué, representing the Academy of Sciences; by M. Gaston Paris, the Director of the Collège de France; by Dr. Guyon, the delegate from the Academy of Medicine; and, finally, by M. Berthelot himself. Professor Fischer read an address on behalf of the Royal Academy of Prussia; Professor Ramsay, the discoverer of argon, spoke for the Royal Society; and Professor Lieben for the Imperial Academy of Vienna. At the close of the celebration President Loubet presented M. Berthelot with a commemorative medal, designed by Chaplain, representing the scientist in his laboratory, seated in a familiar attitude at his desk. Behind him stand two female figures, the one holding a flag and a laurel, the other a mirror. Their names are given in the motto inscribed beneath, "Pour la Patrie et la Vérité.'"

Berthelot is a remarkable type of modern scientist. He has pursued scientific researches with distinction, and has still found time to indulge in the speculations of philosophy and to discharge the duties of citizenship and of public life. His principal work has been in chemistry. In the space of fifty years he has submitted to the Academy of Sciences more than 600 memoirs, besides publishing treatises on organic chemistry, on chemical mechanics, on agricultural chemistry, and works on the philosophy of science and on the history of alchemy. He has thus treated a wide range of subjects, and, thanks to the richness of his intellectual resources and to his prodigious capacity for work, he has left his mark upon every branch of chemistry. "You are one of the last encyclopædists of our science," declared his disciple, M. Moissan, in his address at the celebration.

Nevertheless, by reason of two epoch-making discoveries, M. Berthelot's reputation as a chemist is especially associated with two subjects. The one is the synthesis of organic compounds; the other is thermochemistry. At a time when all scientists agreed with Lavoisier that chemistry was purely an analytical science—that it could decompose into elements, but not reconstruct—Berthelot was one of the first to demonstrate that chemistry could also perform syntheses. In 1862 he announced the discovery that acetylene could be formed from its elements, carbon and hydrogen, by the agency of the electric arc. To the statement of Lavoisier, "The process of chemistry is to divide, subdivide, and resubdivide," Berthelot replied with the declaration, "Chemistry creates its object. It can restore what it has destroyed. Synthesis extends its conquests from the elements to the most complicated substances, without possibility of assigning a definite limit." Berthelot created a whole series of substances previously unknown, and reproduced artificially fruit acids, perfumes, fats, and dyes. Commerce owes to him the elaboration of new dye-stuffs, and medicine a host of new drugs. The second great conception attached to his name is that of thermochemistry, which he created and then developed during a period of thirty-five years. He showed that chemical combinations are ruled by a constant law, which may be thus expressed: "Of several possible reactions, the one which occurs is that which disengages the greatest amount of heat." Berthelot's discoveries in thermochemistry led him to investigations in explosives. During the war of 1870 he placed his chemical knowledge at the service of his country, and later the continuation of his researches carried on by Vieille led to the invention of smokeless powder. But only a professional chemist could enumerate all his contributions to agricultural and industrial chemistry. "With Pasteur," said Jules Lemaître, in his address welcoming him into the Academy, "you have been of all men in the nineteenth century perhaps the most useful to your fellow-beings."

Berthelot, indeed, has never separated scientific theory from practical results in the direction of material benefit and intellectual and social emancipation. A few years ago, when Brunetière, in one of those oratorical formulas of which he has the secret, spoke of "the bankruptcy of science," it was to Berthelot that the free-thinkers and the thorough-going democrats instinctively turned for an example and a response to the sophisms of the reactionary writer. Berthelot believes in science as he believes in reason and in the indefinite progress of humanity. In this he is the heir of the Encyclopædists of the eighteenth century, whose universal intelligence and generous optimism he shares. He holds that science has introduced into the world a new principle, destined to serve as the base of society. "This principle," he has written, "proclaimed a century ago by the French Revolution in the name of justice and reason, becomes every year more evident and more cogent; it sweeps aside the doctrine of divine right, borrowed from the mysticism of the Church, the hereditary pretensions of the old aristocracies, and the insolent claims of the plutocracies of to-day." But the positivism of M. Berthelot has nothing of the fanatic violence of the French radicals who claim him as one of themselves. In this respect he shows the influence of Renan, his friend and confidant for fifty years. The two met at the age of twenty, just after Renan had left the Seminary of St. Sulpice. They at once detected their intellectual brotherhood, and thereafter continued to live in entire communion despite the divergence of their studies. Some of Renan's most characteristic views in philosophy and science are expressed in his numerous letters to Berthelot.

On one occasion Berthelot said of himself, "From the very beginning I have been devoted to the cult of pure science. I have never entered into the conflict of practical interests which divide man and man. I have lived in my laboratory, surrounded only by a few pupils, who have been at the same time my friends." In this statement he was far from doing himself justice. In fact, of all French scientists, Berthelot is the one who has participated the most in public affairs. During the war of 1870 he manufactured dynamite, and attempted to set up electrical communication between Paris and the provinces by means of the frozen surface of the Seine; in the attempt to blow up the Prussian battery at Châtillon he descended into the mines at Clamart, risking his life like the most obscure volunteer. Later, upon the foundation of the republic, he was called to the Senate, where he took his seat with the Advanced Left, voting with the Radicals, and taking part in all the debates, in which his position as scientist and educator gave his voice authority. In 1886 he became Minister of Public Instruction in the Goblet Ministry. Still later, when M. Bourgeois found no diplomat willing to act as Minister of Foreign Affairs in his cabinet of Radicals, he turned to Berthelot. It must be added that the great chemist hardly distinguished himself in this unwonted capacity; fortunately for France, the Ministry lasted only a short time.

At present M. Berthelot is seventy-six. The hostility aroused in certain quarters by his militant rationalism and his radical politics has gradually subsided. At one time he was reproached with fondness for public notice and with too great a desire for emolument and place—he who never took out a patent on discoveries which have

brought in millions to others. A scoffing journalist once even proposed for him the epitaph, "Here lies Berthelot, in the only place that he never solicited." The French Academy, to which he was elected last year, refused him, seven years ago, the seat of Renan, to which he had so strong a claim. Latterly, however, he has lived in a more peaceful atmosphere. His life is now tranquil and happy; his name is honored. His time is divided between his researches in the laboratory, his lectures at the Collège de France, his duties as Academician, and his family life. His numerous children all show something of their father's tastes. His two daughters have married scientists, and his four sons have entered scientific, literary, or political life. His reputation and his personality are no longer the subject of contention. He has succeeded, in the grateful admiration of France, to the place held by Pasteur; and the other day, at the celebration which crowned his scientific career, M. Leygues could say without exaggeration that his place was already fixed, "in the serene peace of history and immortality."

OTHON GUERLAC.

REVIEW OF ITALIAN FICTION.

ALASSIO, December, 1901.

Of two of the principal among recent Italian novels, Fogazzaro's 'Piccolo Mondo Moderno' and 'Il Fuoco' of Gabriele D'Annunzio, we can have nothing to say here; the former has already been separately treated in these pages, and the *succès de scandale* of the latter was long ago a stench in delicate nostrils. There are two writers, whose achievements we have always been glad to chronicle, who this year furnish us nothing. For the last two or three years the *Nuova Antologia* has promised as of imminent publication 'La Duchessa di Leyra' by Verga, the first chapter of which has, however, not yet appeared; while Federico De Roberto has given himself entirely to psychology and literary criticism. *Noblesse oblige*, and the author of "I Vicerè' should not neglect the fields where he is inimitable for those where many another is as good as he.

Our French brethren say that no man is necessary, and it is true that, no matter who may disappear, the crop of novels does not fail. Among the veterans of literature there are two who have produced works that cannot be overlooked. Matilde Serao is almost at her very best in 'Suor Giovanna della Croce,' the story, simple, but deeply pathetic, of a nun thrown with needless brutality upon the world by the suppression of the convents, and sinking gradually into the most abject misery. The book is not so much a connected story as a series of pictures, and these are more than once open to the objection that the setting is finished at the expense of the main figure; but none the less the impression made is strong and lasting. It is perhaps a pity that the subject should be one about which party rage blinds so many on both sides; but it is also fortunate that the ordinary reader is a human being before he is a partisan.

This year, too, Luigi Capuana has made good his reputation of being one of the best among Italian novelists. His short stories, 'Le Paesane' and 'Nuove Paesane,' for instance, were always sufficient to justify the consideration in which he is held; but some of the longer works, and, in particular, one which has been counted his masterpiece, 'Giacinta,' while possessing undeniable qualities, has seemed to us too rank a flower of the Zola hot-house to be pleasing to an unheated judgment. But 'Il Marchese di Roccaverdina' is of quite another and higher order. It is a powerful and convincing story of the Nemesis that pursues the murderer. The scene is laid in a town of southeastern Sicily, and the protagonist is a *marchese contadino*—a sort of Italian equivalent of the typical British squire of a century ago, or the French *hobereau*, only less boisterous than the former and without the suggestion of caricature that attaches to the latter. The story of his crime and its punishment is told with the greatest sobriety of manner, with commendable reserve in descriptions, and without abuse of what is called psychology. And yet the style is of admirable finish, the descriptions are vivid, and we are in the secret of the moving springs of the figure whose action we watch from end to end with unflagging interest. The poet Panzacchi has revealed to us the care with which Signor Capuana polishes each sentence, but there is here no evidence of labor; the touch seems always light, sure, and spontaneous. This has always been characteristic of the author's short stories, and is still in the latest collection, published under the title of 'Il Benefattore.'

We had formerly occasion to remark on the incredible corruption of the clergy, as represented in Carlo Del Balzo's 'Gente di Chiesa.' It recalled the 'Pot-Bouille' of Zola. We could not believe that the shepherds of the flock were, one and all, so much blacker than the blackest of their sheep, but we lacked the key to the mystery. The author's new novel, 'Le Ostriche,' a story of political life in the Italian Parliament, has, however, made everything clear. Sig. Del Balzo is a Deputy who sits on the extreme left of the Chamber, and it is simply his *métier* to represent the Church as a putrefying mass in a world that has great need of being made over by reformers of his way of thinking. This time he has fallen foul of Crispi and the bank scandals. We should not wish to imply that Sig. Del Balzo is altogether wrong in his views; but what his novels gain in intensity of coloring from the heat and force of his convictions, they lose as works of art. Still, in spite of bad construction, of clumsiness, and ingenuousness, they are readable, even to those who cannot see things as does a Deputy of the Left. They are clever; but, after all, they scarcely belong to literature.

Sig. Ugo Ojetti is a good critic of art, and a newspaper correspondent of unusual culture and gifts of expression. He knows so much, and can do well so many things, that it may be permitted to wish that he would abstain from writing novels. 'Il Vecchio,' to which we formerly called attention, was but a dismal performance, and the present one, 'Il Giuoco dell' Amore,' is even worse, though more pleasantly written. The experienced novel-reader will find in the preface one of those apologies that reveal just what he is to expect. It is here said that the book "will be called, and perhaps even also thought, frivolous, skeptical, and useless." After that he knows that it will shock some readers, and disgust others. In this case, the writer does not—to give the devil his due—pretend that he has a purpose so lofty as to excuse the unpleasantnesses by the way. In truth, the mouth is simply speaking out of the abundance of the heart. We scarcely know how to characterize the story, unless indirectly. In a series of letters written from America to the *Corriere della Sera*, and since then published in book form, Sig. Ojetti describes a visit to Harvard University. Bourget, in his 'Outre-Mer,' had been the dupe of the Harvard student (*si figura!*), and had spoken of him as clean-minded. Sig. Ojetti knew human nature better than that, and, being together with some of these students, he gave the conversation a pornographic turn, so deftly, so blandly, that some of the youth fell into the trap, and tried to cap the foreigner's pleasant stories. Sig. Ojetti triumphantly publishes his discovery that the Harvard student is not only no cleaner-minded than himself, but that he is really worse, as he adds hypocrisy to his other frailties. You have here the measure of the man. If any Harvard Tartuffe cares to know of what Sig. Ojetti is capable in his serious moments, he can read 'Il Giuco dell' Amore.' For any other it will be sufficient to say that the conduct of the *Giuocatore* quite justifies the up-to-date definition of love in the last chapter, as "a simple and brief act, like a pressure of the hand between two sympathetic persons, or a gay and succulent lunch between two friends, of which, after its digestion, a pleasant memory remains, if not also a gentle gratitude towards the companion."

After this it is refreshing to read something less modern, especially if, like 'Il Riscatto' of Arturo Graf (published first in the *Nuova Antologia*), it be delicate, charming in form, full of poetry, and clean. The book reminds one of a minuet in its simplicity, in a certain slow rhythmical stateliness, and in its grace. It is the autobiography of a man, still young, who has inherited from a long line of ancestors a tendency to suicide, and who is redeemed by love at the moment when, by irresistible force, he seemed about to follow the example of his forefathers. There have not been wanting those who have objected to this solution, as rather sentimental than scientific, since hereditary madness, no more than consumption, can be cured by love; to which the author, in an appendix to the volume, replies, in effect, that that remains to be proved—that no one can say whether hereditary suicide is physical or psychical heredity, and that therefore no one can deny the healing force of a psychical remedy. We fancy that the conclusion of the book, whether in itself satisfactory or not, is but of secondary importance with most of its readers, its principal charm being rather independent of the question of probability.

Emilio De Marchi, as the author of 'Demetrio Pinelli' and 'Il Cappello del Prete,' both of which have more than once received the honors of translation, deserves—perhaps one should say, deserved—a more distinguished consideration among his country people than he enjoyed during his lifetime. His recent death called forth in the Milanese press expressions of regret due rather to the man than to the writer; certainly, no stranger would have gleaned from

these notices that Italy had lost one of her most agreeable novelists. Another proof of his value has just been given us in his last work, published with a preface by Gaetano Negri. Had the author lived long enough to see through the press 'Col Fuoco non si Scherza,' he might have removed from the concluding chapters some evidences of hasty composition, but he could scarcely have improved the main part, in which the qualities that made his earlier works attractive have found their fullest expression. For the benefit of those who have learned to appreciate the Lake of Como from Cadenabbia, we may say that the scene of the story is there and in the neighboring Tremezzo, and that, without too much labor in descriptions, it gives a vivid sense of the exquisite beauty of that region.

Sig. Rovetta's peculiar talent shows to better advantage in depicting the sham politician patriot, as in 'La Baraonda,' or the sham literary man, as in 'L'Idolo,' than in representing the goodness of the two ladies, the elderly and the young, in 'La Signorina.' In order not to deter readers who may have already admired Sig. Rovetta's performances, it may be said that these two are offset by another lady of a quite refreshing badness, on the success of whose portrait the author may be fairly congratulated.

Italian novelists, fortunately, are not bound by the French convention in matter of subject, and, in point of fact, only one of the works before us is occupied with the Gallic trinity—though that one is almost worthy of Huysmans at his pornographic worst. The result is a variety of themes as great as that of our English novel; among which one, not worn threadbare, is evident in the title of the Marquis Filippo Crispolti's 'Un Duello.' This is so far from being the charge of a prosecutor that some readers might close the book in doubt as to its moral teaching. The subject gets exhaustively treated from every point of view; and though it was finally clear that the author intended that our verdict should be against the practice of duelling, not only the judicial impartiality he has displayed, but the sympathies and antipathies aroused by his characters tended to make us hesitate. We hold that one of the chief disadvantages of a minute analysis of the motives and feelings of a protagonist in a novel is a resultant dimness of outline and loss of impressiveness. The Marchese Crispolti's protagonist is so well explained, and has such a nice balance of weaknesses and qualities, that we were uncertain on occasion of his value as a hero, and the principle he has espoused suffered with our estimate of him. Nevertheless, the novel is an exceedingly good one, marked by an unusual distinction of tone, and, among other merits, giving a striking picture of Roman society.

Grazia Deledda, whose rare charm of manner we have on a former occasion remarked, has given us several remarkable delineations of life in Sardinia. The first chapter of 'Elias Portolu,' if we were to go no further than that, conveys a notion of the state of mind as to right and wrong, as to duty, property, and human life, of the rude population of the mountain region about Nuoro. They are ignorant and superstitious. Their ideas are crude and often false, but there is in these simple creatures such a flavor of the soil, something so elemental and in harmony with the child that is in us all, that we find ourselves loving them involuntarily and a little to our own surprise. The witchery, however, is not so much in them as in the hand that has drawn their portrait. Grazia Deledda has the poet's gift; her touch converts what she sees and feels into a thing of beauty. And she loves her Sardinia even to the remotest recesses of its mountains, and its inhabitants, especially the lowly; and she knows the processes of their minds, the cravings of their hearts. Hers is not a laughing muse; but the humble tragedies she chooses for her subject—set in wild landscapes, where the vegetation, the atmosphere, the light, the perfumes have all a character of their own, and narrated with a grace that is equally individual—are as far as possible removed from the commonplace that haunts and wearies our daily walk and conversation.

Sig. Olivieri San Giacomo continues to furnish stories of military life which have interest for the foreigner as showing the daily routine and much of the spirit of the Italian soldier and officer. They seem to be popular in the army, but, though easy enough reading, never rise above mediocrity, either in conception or in execution. We had formerly pleasure in speaking of the promise of another writer, a young one, Angiolo Silvio Novaro, whose last book, however, 'L'Angelo Risvegliato,' is a sad disappointment. We say nothing more about it, in the hope that his next work will fulfil the expectation awakened by the first. Sig. Avancinio Avancini, whose 'Idolo Infranto' has already been favorably noticed by us, has given a volume of short stories, 'I Racconti dell' Allegre Compare,' that for clear directness of style, for good humor, vivacity, picturesqueness, could scarcely be bettered. This is one of the good books of the year. We could wish that the author were at times a little less *bourgeois* in his limitations, or at least that he would forgive the Milanese aristocracy that he was not born in their ranks. The defect, however, is not a serious one; indeed, when he brings before us palpitating with life Don Ramiro Gonzalo, Prince of Boscofiorito, it is not a defect at all, but a quality for which we are duly thankful.

In marked contrast to these admirable stories are those in the volume entitled 'Silvano,' by Orazio Grande. They will scarcely appeal to the lay reader, and among the professed *gens de lettres* they will please the section with whom manner, or rather mannerism, is more agreeable than simplicity. They are like water-colors with dim contours, washed-out tints, lackadaisical attitudes, and every possible prettyism of style. We mention them because they possess not only a certain grace and refinement, but something which makes us believe that, if the author were subjected to a sound régime with perhaps the aid of a tonic, he might become capable of really good work.

We pause, but not from want of material. We have said enough to show that the new efflorescence in Italian literature gives no sign of diminution. With every year, however, one great change in the intellectual life of the country becomes more apparent. In the days when the peninsula was cut up into a number of States, it was no more than natural that there should be several literary, scientific, or artistic centres. After the unification of Italy, these cities remained as centres, and, notwithstanding occasional jealousies, this dispersion of intellectual forces had the advantage that in none of the larger cities was there the dull provincialism of which people complain in the cities of France outside of Paris. The fact that of all the works enumerated in this communication, only one (that of Sig. San Giacomo) was not published in Milan, would indicate that the old order of things is passing away. Their authors, Sicilian, Neapolitan, Tuscan, seem more and more to gravitate to the Lombard capital, which more and more becomes the city of initiative, the centre of Italian intelligence. And this without as yet deadening the life of other centres. Rome is not merely in name a capital; Turin has a strong independent existence, an admirably alert intelligence, a power of originating and carrying out good ideas that makes it hard to say that she is second to any other city; Florence, Naples, Venice—they are all instinct with new life. It is only that Milan, in many fields of activity, is acquiring a sort of primacy. Fortunately, with the quickened means of communication, commerce between the great cities is lively, so that the blood flows freely from the centre to the extremities. Visions of ancient empire have imposed Rome upon the Italians as the seat of their Government of infinite aspirations; it was perhaps a superstition that held the old throne necessary for the new domination; but it is the simplest of natural laws that makes the intelligence of to-day, forgetting regional jealousies, and recognizing the substantial unity of the regenerate Italy, seek its proper breathing space in the ancient ducal capital of Lombardy.

S. K.

Correspondence.

CONTINENTAL EXPANSION.

To the Editor of The Nation:

Sir: The extract which you publish from *La Revue Américaine*, expressing the sentiments of South Americans towards the United States, impels me to offer a few remarks upon a letter signed "P. J.," which appeared in your issue of December 12, that otherwise might have been allowed to pass unnoticed.

Five or six years ago an American gentleman who came to reside in Canada for business purposes, expressed to me his astonishment at the feeling of aversion to his own country which he found prevalent here. I pointed out to him that there were sufficient reasons for this feeling in the history of our relations during the past century and a quarter, in the unneighborly policy observed by successive American governments towards us, both in tariff and in other matters, and also in the hostility of American public opinion towards Great Britain. A further cause of irritation is the habit of American writers ignoring the right of Canada to an independent existence upon this continent, treating our future as a matter to be determined by the United States.

Your correspondent "P. J." says:

"Our destiny is at some, perhaps not remote, time to absorb all of the continent north of us. Keeping closely to our con-

tinental position, this would be easy to accomplish, even if opposed by the whole power of Great Britain. The seacoast States could defend themselves while the interior States were overruning Canada; but if the time should come when Great Britain was not able to maintain all of its possessions, the annexation of Canada could be made peaceably."

A Canadian might say with Parson Wilbur—

> —"thet all this big talk of our destinies
> Is half on it ign'ance, an' t' other half rum";

but what is your opinion of it, sir, you who print the above without comment and without protest? We are accustomed to menace and insult from such papers as the New York *Sun* and from such demagogues as Bourke Cockran. Do you think a widespread repetition of their sentiments in respectable quarters can fail to produce deep resentment here?

The improved tone of the American press of late towards England has led to a more friendly feeling in Canada for the United States, but there can be no cordiality on our part without a great change in your attitude towards us. We prize our liberty and autonomy as highly as any people that ever lived; we are firmly loyal to the British crown; and we are determined to build up a great independent and self-governing British Power on the north of this continent—a free community within a world-encircling empire.

American policy towards Canada has hitherto afforded a striking example of how a little mind may go with great possessions. The last thing we expect from the United States is magnanimity, yet that is the first essential towards genuine and permanent good feeling between us and our neighbors. R. W. SHANNON.

OTTAWA, CANADA, December 24, 1901.

[Our opinion is, that our correspondent "P. J." was addressing a military *argumentum ad hominem* to the champions of colonial expansion; further, that he would not be found to be in favor of the use of force to attain that fusion of Canada and the United States which he might, in a perfectly friendly and neighborly spirit, believe to be naturally inevitable. But we do not hold ourselves responsible for the views of our correspondents.—ED. NATION.]

CANADA AND ALASKA.

TO THE EDITOR OF THE NATION:

SIR: A short time since, the Toronto *Globe* printed a rumor from Ottawa that Canada was about to press again her recent claim to a portion of Alaska, and a second time to urge the United States to submit this demand to the arbitration of foreigners for settlement. But there is nothing in this demand to arbitrate.

Russia and England, after protracted negotiations, agreed by treaty, in 1825, upon a line to divide their respective North American possessions. This frontier was drawn from the Arctic Ocean, along the meridian of 141 degrees west longitude to Mount Saint Elias, and then was to follow the crest of the mountains running parallel to the coast, to the head of the Portland canal, and down that sinuosity to the ocean in fifty-four degrees forty minutes north latitude. But if at any point the crest of the mountains proved to be at a greater distance than ten marine leagues from the shore, then the frontier should run parallel to the sinuosities of the coast at a distance of ten marine leagues inland, but never further than that from the shore.

This gave to Russia a strip of territory, or *lisière*, from Mount Saint Elias to the Portland canal of sufficient width to entirely exclude the British Empire from any access to tide water above fifty-four degrees forty minutes. And that England was so excluded from contact with the sea north of fifty-four degrees forty minutes, the English and the Canadian Governments recognized, both on their maps and by the acts of their officials. This strip of territory, or *lisière*, became ours when we bought Alaska in 1867 from Russia, and we succeeded to all her rights of sovereignty.

If the claim of Canada—that she is entitled to many outlets upon tide water above fifty-four degrees forty minutes—were submitted to arbitration, and the judges decided anything in favor of Canada, it would be a clear gain for her. And if the judgment gave Canada but a single port, like Pyramid Harbor or Dyea on the Lynn Canal, for instance, the present and future value to the United States of the Alaskan *lisière* would be greatly impaired. The evidence in the case is all in favor of the United States, and shows that they are entitled, by long, uninterrupted occupancy and other rights, to an unbroken strip of territory on the mainland from Mount Saint Elias down to the Portland Canal. There is no more reason for this country to agree to refer its right to the possession and sovereignty of this unbroken Alaskan *lisière* to the decision of foreigners, than would be the case if the English Empire advanced a demand to sovereignty over the coast of the Carolinas or the port of Baltimore, and suggested that the claim should be referred to the judgment of the subjects of third Powers. Whether the frontier should pass over a certain mountain or through a given gorge is a proper subject for settlement by a mutual survey. But by no possibility has Canada any right to territory touching tide water above fifty-four degrees forty minutes. The United States should not consent to submit such a proposition to arbitration. T. W. BALCH.

PHILADELPHIA, December 27, 1901.

BYRON, COLERIDGE, AND DON JUAN.

TO THE EDITOR OF THE NATION:

SIR: Mr. Prothero, in the fifth volume of his excellent edition of Byron's 'Letters and Journals,' gives the following note at page 243: "D. Juan Tenorio of Seville was the hero of the Spanish mystery-play, the *Atheista Fulminato* (see Coleridge's 'Biographia Literaria,' vol. ii., pp. 262 seqq.). The mystery was dramatized by Gabriel Tellez, *i. e.*, Tirso de Molina," etc.

The existence of such a Spanish mystery-play has long been denied by the best foreign critics, but they have not explained the origin of the idea. Puibusque, in his 'Histoire Comparée des Littératures Espagnole et Française' (1843), first spread this story in Europe. He makes the same statement as that given above (vol. ii., pp. 239, 467), and quotes as his authority "Coleridge, commentator of Byron's complete works," whose note he saw in the French translation of B. Laroche. Puibusque evidently mistook an illustrative passage from the 'Biographia Literaria' for an editor's note. He gives plausibility to his statement by quoting scenes from this alleged "Ateista Fulminado."

Coleridge makes his original statement (in the 'Biog. Lit.') in the criticism on Bertram. He mentions "an old Spanish play entitled *Atheista Fulminato*, formerly, and perhaps still, acted in the churches and monasteries of Spain, and which, under various names (Don Juan, the Libertine, etc.), has had its day of favor in every country throughout Europe." Later he quotes parts of different scenes, apparently his own translation from this Spanish play; and, several pages farther on, he speaks of Shadwell's "Libertine," "an adaptation of the *Atheista Fulminato* to the English stage in the reign of Charles the Second." But what Coleridge does not state is that the scenes which he quotes are nothing but extracts from "The Libertine," word for word! Moreover, the statement about the Spanish "Atheista" is apparently nothing but a confused reminiscence of the following sentence from Shadwell's preface to his play: "And I have been told by a worthy Gentleman, that many Years agone (when first a Play was made upon this Story in Italy), he has seen it acted there by the name of *Atheisto Fulminato*, in Churches on *Sundays*, as a Part of Devotion," etc. This religious play was, of course, subsequent, not prior to, the Spanish drama said to be by Téllez.

We see that the whole myth about an early Spanish mystery-play is based on a strange perversion of Shadwell by Coleridge, who did not see that *fulminato* is Italian, not Spanish. Puibusque, in repeating the error, gave the word its Spanish termination, which served to strengthen the roots of the legend. S. G. MORLEY.

HARVARD UNIVERSITY, December 16, 1901.

COMPLAINT AND REPLY.

TO THE EDITOR OF THE NATION:

SIR: In the review of the 'Queen's Comrade,' which appears in your paper of the 14th inst., there is one sentence which, more than all others, is quite unjustifiable. Your critic says that such history as the volumes contain "treats chiefly of *things* that either never happened at all, or, having happened, were of little account." As to the first part of this sentence, any reader will see that authorities are given for every statement made; and, as for the second, the downfall of James, the Revolution, the reigns of William and Mary and Anne, are of some little account. As your reviewer's remark, which is neither true nor just, is calculated to injure the sale of the book, I hope you will have the kindness to insert this correction in your pages.

Faithfully yours,

FITZGERALD MOLLOY.

90 PORTSDOWN ROAD, LONDON W.,
November 28, 1901.

[Our meaning was, that of the history which the book contains, much, like all history of intrigue, cabal, and conspiracy, had, of necessity, to do with many things which never came to pass, or, having come to pass, were of little account. We never, of course, intended to refer to

faits accomplis like the Revolution and the events of the reigns preceding and following it, but to the workings of the under world and the back-stairs, with which the present volumes have very properly to do.—Ed. Nation.]

"TO CHANCER."

To the Editor of The Nation:

Sir: In the 'Century Dictionary' we read:

"Chancer, *v. t.* [Formed from *chancery.*] To adjust according to principles of equity, as would be done by a court of chancery: as, to *chancer* a forfeiture. *Mass. Prov. Laws.*"

And in the 'Oxford Dictionary':

"Chancer, *v. rare.* [? f. Chancery.] *trans.* To 'tax' (an account or bill of costs)."

The editors of the Century content themselves with a vague reference; Dr. Murray gives but a single quotation (from an American work, dated 1798); and in both dictionaries *to chancer* is regarded as certainly or probably formed from the noun *chancery.* Of the fact that *to chancer* is ultimately derived from the noun *chancery,* there can be no doubt; but it appears, from a work only recently published, that there was formerly a verb, the existence of which does not seem to have been suspected, namely, *to chancery.* There are many examples of this verb in the work first quoted below:

"The deffend[t] desiring a chancery the plantiff Gonn & not to be found The Court ordered a respit of y[e] execution till the 9 of october next to wch time this Court Adjourn themselues [& chanceried the damage Additionall to 40[s] only.] . . . The plaintiff desired his bond might be chanceried The Court hauing heard the plaintiff & defend[t]s pleas as to the Chancering of the bond did chancery it to sixty-eight pounds flue shilling[s] & tenn penc mony & Costs of Courts two pounds sixteen shillings & sixe pence. . . . In answer to the motion of Joseph Helljer The Court chanceried his bond to one hundred & eight pounds money & Costs of Courts." 1674, 1684, 1685, *Records of the Court of Assistants, Mass.* (1901), pp. 21, 261, 287.

"*And it is hereby further enacted* . . .

"That there be a high court of chancery within this province, who shall have power and authority to hear and determine all matters of equity, . . . *provided, nevertheless,* that the justices in any of the courts aforesaid, where the forfeiture of any penal bond is found, shall be and hereby are impowred to chancer the same unto the just debt and damages." 1692, *Acts & Resolves of the Prov. of Mass.* (1869), i. 75.

"*Be it enacted* . . . That in all cases brought or to be brought for tryal in the superiour court of judicature, . . . where the forfeiture or penalty annexed unto any articles, . . . shall be found by verdict of jury, . . . the justices of the said courts respectively where the tryal is had are hereby impowred and authorized to moderate the rigour of the law, and on consideration of such cases, according to equity and good conscience to chancer the forfeiture, . . . and enter up judgement for the just debt and damages, and to award execution accordingly." 1698, *do.*, i. 356.

"Upon the humble petition of William Collins, of Newport, tanner, to this Assembly, for the chancerizing of two bonds, one of thirty-six pounds, five shillings, and one of twenty-five pounds; . . .

"This Assembly considering the matter, do order and enact, that the said bonds be by the Governor and council truly chancerized to the principal and interest, and entered on said bonds, signed by the recorder." 1707, *Rhode Island Col. Records* (1859), iv. 26.

"The case being called, . . . judgment was given for the appellee, in that the bond should be chancer'd; and that the costs and damages allowed the appellee should amount to £15 01 s." 1709, *do.*, iv. 80.

"Upon the petition of Lt. Charles Whiting, praying that an arbitration bond . . . might be chancered: This Assembly hath considered that the said Watson shall recover by virtue of the judgment of said superiour court given upon said bond, the sum of four pounds seventeen shillings and five pence, and no more, and the said bond is hereby chancered and reduced to that sum." 1719, *Connecticut Col. R cords,* (1872), vi., 127.

"The appellant and appellee being duly heard, this Assembly do adjudge and decree, that the judgment of the General Court of Trials . . . be, and it is hereby chancerized down to twenty shillings." 1722, *R. I. Col. Rec.*, iv. 320.

"Whereupon it is resolved, that the aforesaid note is chancerable, and said judgment is hereby chancered to the sum given by the said arbitrators." 1726, *Ct. Col. Rec.*, vii. 74.

"It is not easily to be accounted for, how *England, France* and *Holland,* have tacitly allowed their several *American Colonies;* by *Laws* of their several Provinces, by *Chancerings* in their Courts of Judicature, and by *Custom;* to depreciate from Time to Time, the value of their original Denominations, to defraud their Principals and Creditors in *Europe.*" 1740, W. Douglass, *Discourse Concerning the Currencies of the British Plantations in America,* p. 7.

"Voted that Messrs. Peter Gillman, Jotham Odiorne & Mr. Hunking Wentworth be a Comittee of this House to joyne such as the Hon[ble] the Council shall appoint to ascertain the vallue of money & Exch[e] for *chancering* the vallue of the bills of Credit." 1742, *New Hampshire Prov. Papers* (1871), v. 159.

"Resolved by this Assembly, that the bond recited in said petition, on which the judgment of the superior court referred to was rendered, be chancer'd down to the sum of sixty-two pounds lawful money." 1761, *Ct. Col. Rec.*, xi. 547.

"Upon the memorial of Caleb Turner . . . showing . . , That it so happened that said Peletiah's business required him to go to sea, and the stamp-act being about to take place he incautiously went to sea, so that the said bond became forfeited &c; praying that the sum might be chancered down &c., as per memorial on file: Resolved by this Assembly, that the said bond of recognizance be and the same is hereby chancered and abated down to the sum of twenty pounds lawful money only." 1768, *do.*, xiii. 110.

Of the six words which appear in these extracts, no fewer than five—*chancerable, chancering, chancerize, chancerizing,* and *to chancery*—have failed to obtain recognition in the dictionaries. Mr. John Noble, the editor of the work first quoted, tells me that *to chancer* is still heard in Massachusetts, though the verbal noun *chancering* is more common. On the other hand, from a Philadelphia lawyer I learn that he is not familiar with these words. Is it possible that the entire group of words is restricted to New England? Perhaps some of your readers learned in the law can give some further information.

Albert Matthews.

Boston, December 17, 1901.

THE KAIBEL CLASSICAL LIBRARY.

To the Editor of The Nation:

Sir: The writer has been asked to make known through the medium of your paper that the library of the late Dr. Kaibel, Professor of Greek and Latin at the University of Göttingen, will be offered for sale in its entirety, and that a manuscript catalogue in a few copies is being prepared, to be sent to libraries for inspection. Applications should be made to Prof. Dr. Carl Dziatzko, Universitäts-Bibliothekar, Göttingen, Germany. The library contains about 4,000 bound volumes in good condition, and some 3,000 to 4,000 pamphlets, and is particularly rich in periodicals, reproductions of inscriptions, and reprints.

Aksel G. S. Josephson.

John Crerar Library, Chicago,
December 21, 1901.

Notes.

Howard Wilford Bell (London and New York) is engaged in a novel enterprise styled "The Unit Library," which is to consist of reprints of classic works (ancient and modern) in a uniform size of 4½ by 6⅝ inches, edited by William Laird Clowes and A. R. Waller. The print will be clear without display or ornament, and the price will be based on the "unit" of 25 pages, plus paper or cloth or leather binding. The first hundred books already announced lead off with Bunyan's 'Pilgrim's Progress' and end with Rousseau's 'Confessions.' The experiment will be watched with interest.

Another "unit" system is to be employed by the New England Historic Genealogical Society of Boston in undertaking the publication of the vital records of towns in Massachusetts (some 190 in number) whose Records are not already printed or on the way to be. Each town is estimated to require an average of 150 printed pages, octavo; and subscriptions to the series will be received at the rate of one cent a page, which includes binding. This is expected to meet the cost of 600 copies. The Records will not be brought down beyond 1845, after which date duplicate copies were filed with the Secretary of the Commonwealth. Communications should be addressed to Henry Ernest Woods, editor, No. 18 Somerset Street, Boston.

Benjamin H. Sanborn & Co., Boston, have in preparation an 'Atlas of the Geography and History of the Ancient World,' in forty-eight maps and plans.

'Deutschland in China, 1900-1901,' is the title of an elaborately illustrated work, to be published under Government supervision and the general editorship of Count Waldersee, in the near future, and intended to be practically the permanent and semi-official record of the German expedition to China. The letterpress itself consists of thirteen chapters from the pens of official participants, and the illustrations (published by the house of August Bogel, Düsseldorf) have been prepared by or under the direction of the battle painter Roscholl, who himself took part in the expedition. The volume will cost thirty marks, and will not be obtainable through the regular book trade until the participants in the expedition and the various libraries have been supplied.

Among the novelties of the ever youthful *Almanach de Gotha,* for 1902, in its 139th year (Gotha: Perthes; New York: Lemcke & Buechner), is a calendar of princely and noble birthdays which editors, court officials, and others, it is suggested, may find handy. There is also a new list of orders. The King and Queen of Italy, and Prince George, the ruler of Crete, furnish three of the four regulation portraits. Under Holland is given the personnel of the new Hague International Arbitration Tribunal, and mention of this leads the editors to remark with uncon-

cealed irony that they derived their information (fairly full but all "paper") on the South African Republic and the Orange Free State from the Transvaal's Legation at Brussels, and that (very meagre) concerning the Orange River Colony and Transvaal Colony from the Cape Minister. The Hague Tribunal is the "idealism" of the time which "cannot always be made to harmonize with the brutality of facts." Thus England's unpopularity invades even the almanacs.

Two new volumes (51, 52) have recently been added to the International Education Series (Appleton). Dr. Henry D. Sheldon, author of 'Student Life and Customs,' presents, in the form of an entertaining and stimulating essay, the outlines of a subject regarding which a considerable amount of material has already accumulated; his bibliography includes 318 titles of books and articles. Those working along similar lines may be trusted not to overlook such a useful guide, but the book may also be read with interest and profit by the more thoughtful of our university and college students, who may find, *e. g.*, in the chapter on debating societies (pp. 135-142, 201-215), thoughts that will be directly helpful to them in the management of their own affairs. Only 80 pages of the volume treat of student life in Europe. The remaining 226 pages are devoted to the United States.

Volume 52 of the same Series, 'An Ideal School, or, Looking Forward,' by Preston W. Search, is ushered in by a preface from Dr. W. T. Harris and an introduction from President G. Stanley Hall. The book is the result of much experience, study, and earnest thought, and Dr. Hall's estimation of its value is hardly an exaggerated one when he states it as his belief that there is no other single volume in this branch of literature "so well calculated to do so much good at the present time."

There is always a place for a good one-volume history of the United States, but we cannot think Mr. Francis Newton Thorpe's 'History of the American People' (McClurg) quite all that was desired. Neither as a textbook nor as a compendious narrative for the general reader is it likely to supersede works already familiar. A volume of 600 pages which gives but three pages to the Missouri Compromise and the Monroe Doctrine, six pages to the tariff of 1828, the Webster-Hayne debate, nullification, and Jackson's controversy with the Bank, half a page to the Dred Scott decision, and only twenty-five pages to the civil war, is certainly quite lacking in balance; while the account of strictly political events during the last fifty years is little more than a dreary enumeration of Presidential candidates and electoral votes, and a summary statement of the demands of party platforms. The chapters treating of State Constitutions and the regulation of suffrage and elections are evidently based on the elaborate discussions of those topics which are contained in Mr. Thorpe's larger works, and recall in general the handling there given them. We have not searched the book for errors, but the "twelve thousand pounds" which Massachusetts is said (p. 77) to have paid for Maine should, of course, be £1,250.

'American Political History' (Holt), by Viola A. Conklin, is the fruit of a course of parlor lectures to women, and professes no larger purpose than that of usefulness to study-clubs. Like most books of its class, it does not go beyond the commonplaces of the subject, and does not always avoid the conventional views of things which more recent scholarship has often changed; but the style is entertaining, and the volume should prove serviceable. If, as we suppose, the work is intended to be used as a sort of textbook where lectures cannot be had, its usefulness would be increased by the addition of a few maps and some references to collateral reading.

Miss Isabel Gordon Curtis's 'Leftovers Made Palatable' (Orange Judd Co.) is a manual which tells how to utilize foods which in an American household usually go to waste. Use is found for the alimentary remnants of every meal whether in hot or cold weather, and the treatment described. This is done so thoroughly that even persons to whom the preparation of food appears a hopeless enigma will find in the little volume inspiration and encouragement. The book stands alone in its class. This gives it unusual importance and makes it highly worthy of commendation.

Mr. Allen C. Clark, a Washington attorney, has republished his biography of Thomas Law, with some changes and considerable additions, in an attractive and even imposing volume, entitled 'Greenleaf and Law in the Federal City' (Washington: Roberts). In this work the author tries to show that the removal of the capital to Washington was in the main due to James Greenleaf; the retention of the capital at Washington, after 1814, to Thomas Law. He also speaks of the part which Robert Morris, John Nicholson, William Cranch, and W. M. Duncanson had in the building of the city. Mr. Clark is unfortunate in ignoring many of the rules of historical investigation and most of the rules of literary art. His narrative, therefore, lacks clearness, and his arguments, conclusiveness. The future historian of the capital, however, will value the material which he has gathered together, and all will applaud his suggestion that something ought to be done in Washington, either by antiquary, by architect, or by photographer, for the preservation of historic places in that historic city.

Minerva, an excellent and broad-minded "review of reviews" published weekly in Rome on the Corso (No. 219), concluded its eleventh volume with its issue of December 8, 1901. This periodical may be recommended to any one wishing to practise himself in the Italian tongue while at the same time improving his mind.

Much the same may be said on behalf of a humane little book compiled by Nigro Licò and published by Hoepli in Milan, entitled 'La Protezione degli Animali.' As might have been expected, there is a chapter directed against vivisection, and the claims of vegetarianism are set forth, without explicit endorsement of it or of Viaud's dictum, "Virtue and beefsteak can never agree." But, in general, the aim is to suppress cruelty in all our dealings with the brute creation.

Bulletin No. 50 of the United States National Museum is filled by Part I. of the "Birds of North and Middle America," a descriptive catalogue of the higher groups, genera, species, and sub-species of birds known to occur in North America, from the Arctic lands to the Isthmus of Panama, the West Indies, and other islands of the Caribbean Sea, and the Galapagos Archipelago, by Robert Ridgeway, curator, Division of Birds. This part, an octavo of 746 pages and 20 plates, contains only the Fringillidæ, the Finches, and about twenty-three pages of preliminary matter, relating to the class, order, and sub-order. Descriptions, synonymy, and keys are given for 389 species and sub-species, belonging to 69 genera. The work is well done, and will be a necessity to any one engaged in the study of birds inhabiting the region included.

Nature, long the leading scientific weekly of the world, offers, in the number for December 12, one of the best periodical indexes ever prepared, embracing nearly fifty double-column pages, and embodying not only the multitude of separate entries, but a classification of them under their respective sciences, with elaborate cross-references. Such sciences as astronomy, chemistry, and electricity are especially full; would not a system of sub-alphabetizing have been preferable here to preserving the mere numerical sequence of pagination? The same would apply to the very lengthy list of book-reviews and to the papers indexed under the sections of the British Association for the Advancement of Science. Authors' names, topics, and the subjects of papers are all included in the single index.

Mr. Edward Wilson James continues his even way in editing the *Lower Norfolk County* (Va.) *Antiquary* (Richmond: Bell), and in the fourth part of his third volume, pp. 135, 136, gives some interesting notes to Norfolk Marriage Bonds of 1802, showing tender consciences on the part of decedent slaveholders. Elizabeth Hawley, making her will in 1804, provides for the freedom of sundry slaves; in case the law forbade, "they were to be kept till emancipation was allowed." James Dawley, in 1814, also emancipates by will even the negroes left his wife by her late husband—"at her death, or before if she chooses." None of them may make up any legacy in his will or descend to any of his children, "for I abhor the idea of slavery."

The forty-second volume of the *Zeitschrift für Biologie* is a "Jubelband" in honor of the seventieth birthday of its editor, Carl Voit, professor of physiology in the Royal Bavarian University. It is made up of twenty-three papers by his pupils, past and present. Among these contributions is one on a certain form of diabetes, by Dr. Graham Lusk, professor of physiology in the University and Bellevue Medical College at New York.

The sixth volume of the current series of the *Archives Néerlandaises des Sciences Exactes et Naturelles* is also a "jubilee" volume, offered by the Dutch Society of Sciences at Harlem to its Secretary, Dr. J. Bosscha, on the seventieth anniversary of his birth. Besides the papers by the resident members of the Society are articles by such eminent foreign associates as Lords Kelvin and Rayleigh of England, Professors Berthelot, Cornu, and Mascart of France, Van't Hoff and Vogel of Germany. The only contribution from America is by Prof. Edward C. Pickering, director of the Harvard College Observatory, on "Variable Stars of Long Period."

The Germans find themselves able to make haste only very slowly in the introduction of a uniform system of revised

orthography. Neither the Prussian nor the Saxon, nor any of the other proposed revisions, had been able to compel general acceptance, and, accordingly, the leading states, including Austria, arranged for a general Conference, which met in Berlin, last June, and completed a scheme of revision, with the understanding that this was to be generally introduced by Easter, 1902. Recently the Prussian Cultus Ministry, in response to inquiries from the officials of the German book-dealers, declared that the change would not be made by the time set, and that the confused condition of affairs now prevailing in German school- and other books must continue indefinitely, so far as Prussia is concerned. No special reason for this delay has been assigned.

An interesting feature of the forthcoming meeting of the Mississippi Historical Society, January 9 and 10, is a session devoted to the history of the Constitutional Convention of 1890. Apparently, a representative of each of the committees of the Convention is to present a history of the measures submitted to it. State historical societies so rarely discuss contemporary happenings that the outcome of the Mississippi experiment will be awaited with interest.

We have received from the Scovill & Adams Company their *American Annual of Photography* for 1902, with its usual diversity of papers on the art, lists of societies, etc., and great range of illustrations. The only three-color print is among the advertisements, and comes from Vienna.

—The occupant of the Easy Chair, in the January *Harper's*, unbosoms his hopes and fears for the Roosevelt Administration. His fears are grounded in the belief that the assassin's bullet has brought to an end an era of Presidents drawn from the common people, putting in their place one whom he classifies unhesitatingly with the aristocratic type of the early Presidency. For the type in general he has but caustic comment. Its conception of duty is not that men are best left to work out their own destinies, but that some one else can best do it for them—a conception akin to the notion of sovereignty "as something that could do no wrong, though it was apparently never able to do right." But he regards "the order of the gentleman" as more promising in this land than in others. "Elsewhere in history it has misgoverned the world worse than the order of the common man; with us alone has it shown the instinct of fellow-citizenship." In the President personally, Mr. Howells recognizes a high sense of honor and the very best intentions. He may do the rash thing, he will not consciously do the wrong. The best hope for him lies in the literary phase of his character. If his class limitations have denied him any actual experience of the needs, the perplexities, and the aspirations of the common man, he may still have enough of the poet in him sufficiently to imagine them. "He is capable, unless his actions and utterances belie him, of imagining the single ambition of being the best servant this people has ever had; and it is for this people to remember that the endeavor to such an end does [not?] rest wholly with him." Mark Twain begins in the same issue "A Double-Barrelled Detective Story," and leaves his reader *in mediis rebus* with the impression that the term "double-barrelled" unduly limits the dangerous possibilities of the situation. Sidney Brooks contributes a paper on London and New York at once instructive, suggestive, and amusing. He concludes his comparison with the opinion that the two cities are intended to be complementary to each other, and that the ideal city must have the good points of both. "Whether this would not involve the preliminary banishment of most London women and most New York men, is a point one might debate for ever."

—Senator Lodge contributes to the January *Scribner's* a paper on "The Treaty-making Powers of the Senate," assuming in his title the point to be proved, viz., that the function of the Senate in the making of treaties is at all stages on an equality with that of the President. Of course, the right either to ratify or reject a treaty places it in the power of the Senate to formulate changes, but it has no power to get such changes before the party of the second part to the treaty unless the President shall choose to accept and communicate them. The real difficulty with the Senate in the matter of treaties, however, lies not so much in the *transcendence* as in the *abuse* of its Constitutional rights. What the people are tired of is not Senate amendments *per se*, but Senate amendments which are inherently vicious, tending to hamper the President in his efforts to maintain right relations with foreign powers, and in some cases tending seriously to retard the progress of civilization. The article of greatest public interest in this number is that of the former Assistant Secretary of the Treasury, Frank A. Vanderlip, on "The American 'Commercial Invasion' of Europe." It is the first of a series, in preparation for which Mr. Vanderlip has had the advantage of extensive interviews with the leading statesmen and financiers of Europe. Our commercial advantages and disadvantages, in comparison with European countries, are clearly set forth; and, among the disadvantages, one finds occasionally an item which the thoughtless are accustomed to reckon on the other side of the account. A man unnamed, but certified to by the writer as one of the most eminent financiers of Europe, is quoted as saying, after speaking of other countries: "But what of your future? We are glad to see you going into the Philippines. We will welcome the time, if you are going to measure strength with us as a military power. Commercially, you are supreme, but if it comes to a test of military strength, if you are going to weight yourselves with the militarism which is the burden of Europe, then we can see some light." Similarly, M. de Witte is quoted as to the enormous harm done to the power of England by those who drew her into the South African war: "Should she have too many Chamberlains and too many Transvaal campaigns, she might be ruined."

—In the *Century's* table of contents we find several items to be credited on its promise of "A Year of American Humor." Readers will not be far from unanimous, we imagine, in assigning the place of honor among these to "The Gentleman of the Plush Rocker," by Ruth McEnery Stuart. Rose Ann, the jolly washerwoman, and her husband, Napoleon Jackson, Esq., who couldn't work "'ca'se his mammy she marked him so," are a pair which one would willingly go through a dozen negro dialect stories to discover. The prize poem, story, and essay of the *Century's* competition for college graduates of 1900 appear in this issue. The poem, by John Erskine of Columbia University, is a smooth and effective treatment of a classic legend, Actæon, with perhaps no more traces of former gleaners in the classic field than are inevitable to a beginner. So far as externals are concerned, the writer is certainly capable of good work; the limits of the present poem are too narrow to warrant an opinion as to his possession of real poetic genius. The story, by Katharine Fullerton, of Radcliffe College, is a story of a story—a type, perhaps, more natural to the young college graduate than to others, but perfectly legitimate if well wrought out. In the present case, a little more simplicity in the telling would be an improvement. The essay, by James E. Routh, jr., of Johns Hopkins University, leaves the suggestion of the college student farther in the distance than either of the other productions. Many a critic with years of experience behind him has been content to publish work far less thorough and convincing than Mr. Routh's study of "Huxley as a Literary Man." Charles Henry Hart closes in this number the series of Gilbert Stuart's "Portraits of Women" with the portraits of Mrs. Robert Morris, wife of the financier of the Revolution, and Mrs. Peter Meircken, wife of a prominent shipping merchant of Philadelphia.

—The first number of the first volume of *Biometrika*, "A Journal for the Statistical Study of Biological Problems," edited in consultation with Francis Galton by W. F. R. Weldon, Karl Pearson, and C. B. Davenport (Cambridge (Eng.) University Press; New York: Macmillan), is a neat-looking quarto of 128 pages. The journal is a quarterly, especially devoted to the publication of statistical data and of papers dealing with statistical theory. Its reasons for existence are the collection of biological data of a kind not systematically collected and published elsewhere, and diffusion of the statistical theories requisite for scientific treatment. It is to include statistical memoirs, in English, French, German, and Italian, on variation, inheritance, and selection in animals and plants; statistical theories applicable to biological problems; tables and solutions to lessen the labor of statistical arithmetic; abstracts of memoirs dealing with these subjects published in other journals, and notes on biometric work and unsolved problems. It will aim to establish such uniformity of treatment, terminology, and notation as will facilitate comparisons. The pages of this number are illustrated by numerous tables of numbers and of curves of interest to specialists. The articles are: "Biometry," "Variationsstatistische Probleme und Materialien," "Data for the Problem of Evolution in Man," "Inheritance of the Duration of Life and the Intensity of Natural Selection in Man," "Variation in Aurelia Aurita," "A First Study of Natural Selection in Clausilia Laminata," etc. The frontispiece is from a photograph of a statue of Darwin. The publication is characterized through and through by what is known as Darwin Evolution, that is, by Natural Selection. Biometry is brought forward as a new branch of science with the primary object of affording material that shall be exact enough for the discovery of incipient

changes in evolution too small to be otherwise apparent. It deals with mass-phenomena, for, as the editor would put it, though a single individual may have a variation making it a fit type for survival, it cannot be an effective factor in evolution until the fit type has increased and multiplied up to comparatively great numbers. And thus it is, through results and effects, not through their causes, that the problem of evolution becomes a problem in the vital statistics of population. There is an abundance of room for the magazine. May it live long and prosper.

—'In the Ice World of Himálaya,' by Dr. W. H. Workman and Mrs. Workman (Cassell), is a record of climbing among the peaks and passes of Ladakh, Nubra, Suru, and Baltistan. The book is altogether destitute of a scientific element and adds little to geographical information. The journeys in question, which occupied the seasons of 1898-99, were undertaken solely for the amusement of the authors and with a view to escaping from the heat of the Indian plains. The most striking feature of the narrative is the description of three mountain ascents in Baltistan, which were effected with the aid of Zurbriggen in 1899. Two of the said peaks rise above the Skoro La glacier near Askole, and the third, Koser Gunge, is not far from Yuno, in the Shigar valley. The summit last named is 21,000 feet, and its conquest by Mrs. Workman is a feat of some importance in the history of mountaineering. No such altitude has ever before been reached by a lady. Apart from the description of routes, there is nothing very distinctive or interesting about the volume. Mr. and Mrs. Workman had a good deal of trouble with native servants, and seem to have been annoyed when they were charged exorbitant prices. But such are the incidents of mountaineering in India, and the traveller who goes to Kashmir and beyond must make up his mind to take things as he finds them. Mrs. Workman has a short chapter about the effect upon her of rarefied air, which may be of some importance to lady climbers in the Alps, the Rockies, and elsewhere. For the rest, the book is sometimes amusing when it hardly means to be, and is not a very valuable addition to mountaineering literature. At the end is placed a singular glossary, wherein may be found, scattered about among Hindustani terms, such interpretations as "*Dir*, to you; *Euch*, to you; *Entourage*, setting; *Ewigen*, eternal; *Friede*, peace; *Heilige*, holy, revered; *Höhen*, heights," etc. The half-tone illustrations are fairly good, and seem in many cases to be taken from excellent photographs.

—The very remarkable changes which the nebulous region round the new star in Perseus has recently been found to undergo, were first discovered on photographic plates taken by Mr. Perrine at the Lick Observatory, and subsequently confirmed by Mr. Ritchey at Williams Bay, Wisconsin. The amount of apparent motion in certain regions of the nebula is quite incredible, and should lead astronomers to suspend judgment as to what has actually taken place in this part of the heavens until there are at least further observational developments. Sir Norman Lockyer, perhaps the most eminent living authority, thinks that the full significance of the recent observations has not been grasped by those who have commented upon them. On a reasonable hypothesis of distance, these observed motions, if such they really are, mean a translation through space equal to 400,000,000 miles daily. Excessively swift movements like these are perhaps not impossible, but there certainly is no precedent for them. Furthermore, Sir Norman shows, there is no necessity for the assumption of such movement; for the apparent change in position of these nebular condensations is easy to explain otherwise than by movement. Applying his well-known meteoritic theory, let us suppose a nebula to be invaded, not by one but by many meteorite swarms, under conditions such that the effects of collision vary greatly in intensity. Nova Persei itself was the most violent of all, and we began to know about it some months ago. Less violent ones, occurring in other parts of the nebula, at least 70,000,000,000 miles removed from the star itself, were learned of only from the recently taken photographs. So feeble are these disturbances that they soon die out, and, while dying, other disturbances in other parts of the nebula arise. As Sir Norman significantly remarks, "It is impossible to think that the great nebula which has now been photographed while the new star is still in being did not exist there a few months ago; and it is important, further, to remark that the nebulous matter already photographed in the region round the Nova is very probably only a portion of the actual amount of matter existing there, and that, if the disturbances continue, more of the remaining portion may become visible." Indeed, the latest photographs show an apparent expansion in all directions.

SEGANTINI.

Giovanni Segantini: The Story of his Life, together with seventy-five reproductions of his pictures in half-tone and photogravure. By Luigi Villari. London: T. Fisher Unwin; New York: E. P. Dutton & Co.

The remarkable qualities in Segantini's work never fail to attract observation in exhibitions of Italian art in which he is represented. They consist in a convincing sincerity of impression, whatever may be his subject; they have a poetry of their own derived from seeking after truth, whether in landscapes of the high Alps or in scenes of peasant life reminding us of Jean François Millet. Segantini is a painter who owes his development to his intense love of nature. This is all the more remarkable in an Italian who, surrounded by the best traditions of art, would, in the practice of the old masters, naturally find influences to inspire and instruct. The old masters never affected Segantini's work in the very least.

Luigi Villari's story of Segantini's life is full of interest, often telling in the artist's own words of the extraordinary difficulties he overcame to become an artist. Everything we can know of the man is here, together with ample illustrations of the pictures mentioned. Giovanni Segantini was born in 1858 at Arco, near the Lake of Garda. His father was a carpenter, his mother sold fruit and vegetables, his home was a dilapidated house on the bridge over the Sarca. High dolomite peaks stand like needles above the village, changing in color with the course of the sun; the valley opens towards the blue waters of the Lake of Garda. The child was weakly from his birth, and at four his earliest recollection is of having been pushed by accident into the river, whose rushing waters carried him towards the great wheel of his godfather's mill. At this early age and during this moment of terror, the effect of light and the color of things around him seem to have impressed themselves on his mind, showing that even from the first he was endowed with remarkable powers of observation. His mother died the year following, at the age of twenty-nine, leaving the child the remembrance, always cherished, of her beauty and suffering, which inspired him later to seek in incidents of maternal love the subject of many pictures.

Segantini's father left Arco after his wife's death and took the boy to Milan, where his eldest son and daughter by a former marriage kept a small perfumer's shop. The business was at a low ebb and soon had to be given up, the father and eldest son emigrating to America to seek a livelihood, while Giovanni remained under the care of his step-sister, who had to leave him all day to his own devices while she worked for the necessary means of subsistence. The tiny rooms in a tenement-house of Via San Simone were a dreary prison for the imaginative child; the windows were so high up that only by standing on the table could he see the sky, which in Milan during winter is often gray and colorless. The boy was oppressed by fear, and sought refuge at the landing window, where he could see the roofs of houses and a little courtyard. He spent his days in gazing out into the distance. One day he allowed himself the relaxation of throwing out tiny pieces of paper and watching their downward course; he thought they looked like snowflakes. He was admonished from below to cease this pastime; but later, when he thought the person had gone, he threw out a whole snow-storm of torn-up paper, and leaned out to watch it settling on the ground. For this he received a thrashing from the house porter on the spot, followed by a second from his sister on her return.

After this incident he was for a long time locked up in his sister's rooms, the prey of terror. He tells of another incident which made a landmark in his boyhood, the sight of pails of paint and brushes on the staircase. His expectation was so excited that he lost all appetite, and watched to see what would happen. The process of house-painting proved disappointing, but in the unequal dabs of red color left on the walls the child managed to see all manner of things—even the green fields and clear brooks of his old home at Arco, for which he was ever longing. Then came the cold winter passed in the lonely rooms with only a charcoal brazier for all heat; but, when spring returned, and he could again look out of the window on the landing, he heard the neighbors talking of some hero of romance who, when quite young, had left Milan and walked to France, where he had become famous, having achieved great deeds. These chance words suggested the possibility of change; he thought he would leave the dull passage where he had spent so many weary hours to go away. His father had once pointed out to him the arch and road built by Napoleon

I. through which the French and Piedmontese troops had entered Milan in triumph; he inferred that that road must lead over the mountains to France, and, with only a piece of bread in his pocket, he set out one day, and, in the heat of spring sunshine, trudged across the Lombard plain onward past the little village he came to. The feeling of being among trees and in the sunshine intoxicated him; it was only when the shades of evening drew on and a thunder-storm seemed approaching that he lay down by the roadside beside the trunk of a tree. Overcome by fatigue, he fell asleep, heedless of rain and thunder. Some country people going by in a cart saw the drenched child, and roused him. On hearing that he was on his way to France, they assured him he had mistaken the road, and offered to take him home with them, where he was well cared for that night. In the morning they proposed sending him back to his sister, but he declared that he would run away again, so they agreed to keep him if he would make himself useful. He remained two or three years with these good people, leading a peasant's life.

While with them it was that Segantini's great inclination towards art manifested itself. "The first time I took up a pencil to draw was when I heard a mother sobbing over her dead child, saying: 'Oh that I had but her portrait, she was so beautiful.'" What this first attempt was like remains unrecorded, but the desire to study art and to see his sister again brought him back to Milan. He worked for his living by day, and studied at the evening class for ornamental drawing at the Brera. He was so poor that he got shut up by the police for a time in the Patronato for abandoned children. He escaped once, was recaptured, and taught the trade of cobbler, but he was allowed to draw, and at this moment several of his early drawings, including a portrait of King Humbert, then Prince, remain in this institution. Soon after this he entered the elementary figure class at the Academy. Here he remained only a few months, leaving it convinced that the instruction offered there was useless to those who were born artists. His antagonism to academic instruction lasted to the end, and prompted him to refuse the diploma of honorary associate which was offered to him later. He worked for money with a painter of banners while studying at the Brera, but utterly despised the work of his employer.

His first oil colors were given him by a friend, a grocer, who required him to paint a signboard. This accomplished, the remains of the color in the tubes served him to paint his first picture, the "Choir of the Church of Sant' Antonio." He could not afford a canvas, but stretched instead a sugar bag dipped in oil. This work represents the interior of a choir with carved stalls and high wainscoting, upon which the sun pours from a high window on the left. Without knowing anything of the science of divisionism, he found out that, by placing pure touches of color side by side, leaving them to fuse to the sight instead of mixing them on the palette, the effect of "more air, more light, consequently more reality," is obtainable. He says, referring to this experiment: "This secret, now a proved fact, had been perceived by painters of all times and all countries, the first of whom was Fra Angelico. It came to me through my loving and earnest study of nature, and as something personal and individual." This is the only reference we find throughout the book in Segantini's writings (which are continually quoted) to the work of the old masters. In common with all great artists, Segantini objected to scientific systems applied to art. He did not adopt divisionism as a manner until much later, and then not to the advantage of his work. The picture on the sugar-bag foundation proved a success, and obtained him the Brera silver medal, and, better still, the friendship of Vittore Grubicy, art critic and artist, whose advice and affection were of the greatest use to the young man. One of the professors at the Brera school gave Segantini a paint-box so that he could practise his loved art, and during the following years at Milan he attempted different methods and produced much work—still-life and genre pictures for the most part. The longing for the life he loved in the country again took possession of him. He had by this time married the sister of his brother artist, Carlo Bugatti, and was able to live by art, so in 1882 he took a villa at Pusiano in the Brianza, on Lake Como, and remained there for four years, finding his subjects among the peasants for whose life and toil he had the greatest sympathy.

It is impossible not to feel in the work of this period that Segantini must have been in some measure influenced by the work of Millet; his range of subjects and their treatment have such strong affinity to the work of the great French artist. Segantini, however, never saw a painting by Millet, but knew his work through a set of engravings after him given him by Signor Grubicy. These must have decided him to turn his hand to painting scenes from the life of the people around him. Notwithstanding the fertility of the soil, the life of the peasant in North Italy is most arduous, and Segantini has expressed every phase of pious resignation to a hard lot. The tie between man and beast, the common feeling of maternity in both, the fatigue of the laborer, his anxieties and cares, the very bareness of the life—all this is told in his work of this period—"Two Mothers," "In the Sheepfold," "A Prayer to the Cross," "The Blessing of the Sheep," "Sheep-Shearing," "The Potato Harvest," etc., etc. Of these works the "Ave Maria *a trasbordo*" became very popular, and has been much noticed out of Italy. It represents a flat-bottomed boat, full of sheep, with hoops for an awning, crossing a lake at evensong. The steeple from the little village on the low-lying shore across the water rings the Ave Maria; the woman holding her child in the prow bends over him in prayer, the shepherd rowing reverently bows his head. The great simplicity of the composition and the luminous effect of the sky and water are very telling. An exhibition at Milan refused to exhibit this picture in 1882, but the following year, at the Amsterdam exhibition, it received the gold medal, and has since become widely familiar. From this moment his work became known in Italy.

Segantini's method of work was very unusual. He did not make preliminary studies, but, after painting his picture, would make sketches and studies from which to correct its defects. "As you know," he wrote, "I never make sketches; because if I were to make the sketch, I should never paint the picture. Most of the artists who have painted a clever sketch have rarely painted a picture that was equal to it, or they have not painted the picture at all, because in the sketch they expressed the spiritual part of their work. I wish that the conception should be preserved in its virginity in the brain." Further on, "In a word, I desire that in the picture one should not see man's childish efforts; I want the picture to appear blended in color. Flowers are thus made. and this is the divine art." It was after the Brianza period of his work that Segantini, in his own opinion and in that of his biographer, achieved his greatest fame. After long wanderings in the Alps in search of a suitable spot from which he could come into contact with Nature in her grandest aspects, he settled at Savagnino, south of Tiefenkasten on the road to Coire. He realized that, in the rarefied air of the high Alps, where the light is so intense, it would be necessary to adopt a method of painting wholly different from that which he had used in his Brianza work; he recognized the research for light in color as the aim of modern art, and he sought to attain this by returning to divisionism and working out the theory as it seemed to suit his subjects. He painted without any adherence to systematic process, but used pointillisme as it served his purpose. It was no innovation, for the French impressionists were working for some time in this vein. He obtained by broken lines a porous texture which seemed to render the broken color and rugged Alpine surface. Another particularity of his pictures of the Alps is his point of view. He has chosen it from a high level, so that the distant peaks do not overpower the foreground or destroy the harmony of the composition. Even in the Alps, Segantini chose the milder aspects of the mountains, and made his pictures out of simple elements. He loved for his foregrounds the twisted trees which become contorted by the storms and cold, the little mountain tarns whose waters are so wonderfully blue, the grazing cattle, and a few human figures in attitudes which tell the tale, rather than any attempt at facial expression; and, far away in the distance, a line of distant peaks, which do not seem so very high, painted as they are from their own level. "Haymaking," "Alpine Pastures," "Spring Pastures," "Spring in the Alps" illustrate this period of the artist's career.

In Savagnino he made his home till about 1894, when he went up to the Maloja and settled on the highest point of the Engadine, 6,000 feet above the sea. Here he spent the last five years of his life, during which period he produced, under the influence of symbolism, fantastic pictures, the merits of which are very much open to discussion. Villari tells us how wanting in education Segantini remained, so that even to the end he never could spell, although, in Italian, spelling is far easier than with us. He wrote much to his friends, often expressing himself very well; he also wrote on art several very remarkable newspaper articles. He was fond of reading, and filled the long winter evenings with books which he did not always understand. He was ignorant of history and mythology, and never chose sub-

jects for pictures from either; but flowers he loved as well as the animals. He writes thus of animal painting:

"I wish that men should love the kindly animals, those that provide them with bed, and meat, and skins; therefore I painted 'The Two Mothers,' 'The Mothers,' and the good horse under the plough, working with man and for man. I painted toil, and rest after toil, and everywhere I painted good animals, with eyes full of gentleness. They who give everything to man—their strength, their offspring, their flesh, and their skins—are beaten and ill-treated by him; but still think that man as a rule loves them—but, above all, loves the earth, for the earth is more generous than aught else; it gives to man and beast."

Symbolism, the result of the painter's literary studies, now took possession of his mind. The works he produced under this inspiration do not seem to us to be good as art, nor do we believe that pictures should be used to preach sermons. "The Source of Evil," a nude woman looking into a mountain pool, where, instead of her reflection, she will see a serpent; "Love at the Fountain of Life," "The Angel of Life," "The Unnatural Mothers," "The Punishment of Luxury," are all of this type. During this time he also continued his landscapes, and painted the triptych, a large composition consisting of three panels, Life, Nature, and Death, with three lunettes above them, and six medallions in the angles. These Alpine landscapes, full of symbolic intention, are very realistically treated, and contain some of his best work, but even our author, who has a profound appreciation of Segantini's work, confesses that the triptych has no decorative effect, and is connected together only by a literary idea. It was for the exhibition of 1900 in Paris that Segantini was painting this last work. He hoped to take it himself, for his desire to go to France had never been realized. In order to study an effect of light, he had his picture carried to the summit of the Schafberg in the middle of September after a snow-storm had come on. There he camped in a shepherd's hut, where he was suddenly taken ill of fever. He sent a shepherd for his doctor, who came to him, as also his wife and children, but he died of peritonitis on September 28, 1899.

Segantini left but few followers. He had all his life felt isolated from his fellow-artists in Italy. He had worked alone, following assiduously the one aim of his life with great nobility of purpose.

Victorian Prose Masters. By W. C. Brownell. Charles Scribner's Sons. 1901.

We have here a collection of serious and well-considered critical essays upon Thackeray, Carlyle, George Eliot, Matthew Arnold, Ruskin, and George Meredith. The work is of a grade which invites comparison with the best critical writing. Mr. Brownell's affiliations are, in a general way, with the tradition of Sainte-Beuve and Matthew Arnold. He does not adopt Sainte-Beuve's intensive method of approach, and he does not exhibit Arnold's peculiarities of tone and manner, but his criticism is like the criticism of these masters in that it is neither impressionist nor academic. It evinces, indeed, both information and taste; it is guided by a purpose, and tempered with geniality.

The schematization is pretty much the same in all the six papers. Each begins with a section upon the vogue of the author under consideration, and then, by study of his personality, style, and ideas, attempts to reconsider earlier judgments in order to assist the orientation of twentieth-century criticism by a summary characterization and definition of the most typical prose writers of the Victorian age. There are few contemporary critics who would have adventured this difficult and delicate task so boldly, or who could have brought it to a completion so prosperous.

Considering Mr. Brownell's work as a whole, we believe that most competent readers will find in the essays upon the three novelists, Thackeray, George Eliot, and Meredith, the greatest edification and the fullest satisfaction. All Mr. Brownell's criticism is manifestly composed with an eye on the book, but this is nowhere more evident than in the essay on Thackeray. He is a thoroughgoing Thackerayan, and the wealth of allusion interspersed in his pages will render them peculiarly pleasing to his fellows in the cult. The most important contribution of his paper to the criticism of Thackeray's writings is its defence of his "reticulation of personal comment." Mr. Brownell says very happily: "It is absolutely true that Thackeray's 'subjectivity' in this way subtly increases the objectivity of his creations. They are in this way definitely 'exteriorized.' In this way we get the most vivid, the most realizing sense of them as independent existences; and in this way we get Thackeray too." To show how keen is Mr. Brownell's interest in character in fiction, and how discerning his judgment, it may be well to set over against this passage his discrimination of the peculiar quality of George Eliot's people:

"They occupy a middle ground, . . . one may say, between the personages of Thackeray, who is accused latterly of having no psychology, and those of Hawthorne, which, as Mr. James points out, are never types. This is, perhaps, why they are so rarely our companions, our intimates, as the characters of even inferior novelists are, though I imagine the reason is mainly that they are mentally rather than temperamentally individualized, and that it is the sense, the volitions, the emotions rather than the intellect of people which, in fiction as in life, attach them to us, and give them other than a quasi-scientific interest for us."

The study of Meredith will not wholly please the more ardent Meredithians, but it is surely one of the best, as it is the longest, in the book. The fundamental assumption, the cardinal heresy from the Meredithian point of view, is contained in the following sentences: "Mr. Meredith's world, however, is not the real world. It is a fantastic one, treated realistically. It is not simple enough to be real; he is not simple enough." This thesis is defended with much minuteness of citation and cogency of argument. Ample justice is done to Meredith's very great intellectual force, his subtlety of understanding, the fertility of his invention, and his occasional exhibitions of poetic insight of a very high order. But we fancy few catholic and unprejudiced readers will be found to dissent from Mr. Brownell's final opinion:

"What one misses most in his work is the large rhythm which undulates through that of the great writers, the sustained note of informing purpose, the deep vibrations of some unifying undertone, now rising to accent and emphasis, now sounding faintly beneath the multifariousness of accompanying motives, but always audible to an attentive sense as the basis, if not the burden, of the 'theme with variations' that the ensemble of every great writer's compositions constitutes. Mr. Meredith has no theme; he has a dozen, a score—as many as he has books. And this, I imagine, is the standing menace to the increase of his popularity and the permanence of his fame."

We have been lured into such copious quotations from Mr. Brownell's discussion of the novelists that small space is left for animadversions upon his treatment of Carlyle, Ruskin, and Arnold. The latter group, as compared with the former, is appreciably less conspicuous for *intimité*. The strictures upon Carlyle's "agitated thinking" and Ruskin's emotional fallacies are just, but less original and informing than the writing upon Thackeray and George Eliot. The essay upon Matthew Arnold will be to the majority of readers the most and to many the least satisfactory. A man's predilections as a critic, but in no sense his rank, may be pretty accurately determined as he prefers Arnold's verse or his prose. Mr. Brownell esteems the latter the better and higher work. His eulogy of criticism as an honorable branch of literature contains much wisdom, and will be welcome to all critics, professional or amateur. But while it is perfectly true that criticism is "a characterization of art, as art is a characterization of nature; and in characterizing, it translates as art itself translates," there is still a fundamental difference between the imaginative work of the critic and that of the "maker." This is a distinction which Arnold himself would have been the last to waive. The essay on Arnold is a curious instance of the fluidity of critical appreciations. As Mr. Brownell warms to his theme, the treatment grows increasingly sympathetic even to the point of becoming slightly inconsistent with what has gone before. Indeed, Mr. Brownell's excellent statement of the nature of Arnold's critical principles is fairly applicable to his own work: "Certain definite *ideas*, held with elastic firmness, but not developed into any set of procrustean principles, formed his *credo*, and his criticism consisted in the application of these as a test and measure of quality and worth."

Enough of Mr. Brownell's work has been quoted to convey some notion not only of his quality as a critic, but also of his skill in the composition of English prose. Of the rhythmical graces of prose he is not very careful, and his style is marred by the excessive and somewhat vague use of current words like "notable"; but in general his writing is exceptional in its precise propriety of diction, the fit expression of the vigor and lucidity of his thought.

George Whitefield, M.A., Field Preacher. By James Paterson Gledstone. Second Edition. New York: American Tract Society. 1901.

Mr. Gledstone's book is at the same time interesting and unsatisfactory. It is a good story of Whitefield's life, told in an easy and attractive style. But the treatment is extremely superficial. We get little account of the conditions under which Whitefield did his work, less of the substance of his message or of its practical effects,

and much less than we desire or need of Wesley's contemporary work. It may be said that we should be satisfied with one of these persons at a time, but it is impossible to understand either without much reference to the other. There is little explication of the terrible quarrel between Wesley and Whitefield as to the relative merits of Arminianism and Calvinism. We are made witnesses to a great battle, but the field is rolled in smoke, and we would gladly have Mr. Gledstone

"tell us all about the war,
And what they killed each other for."

We know that election was set off against free grace, but we would fain be made wiser as to the bearing of the opposing views on the moral influence of the one evangelist and the other. Wesley had a more irritating manner than Whitefield, but nothing could be more unlovely than the way in which Whitefield dips his personal rebuke in pious phrases when he would drive it home. We are hardly justified in blaming the writer of one book for not writing another, but those who have read Miss Julia Wedgwood's 'John Wesley' will certainly wish that Mr. Gledstone had brought to his subject something of Miss Wedgwood's searching psychological analysis.

As touching Wesley, Mr. Gledstone's manner is that of mild depreciation. Yet he nowhere tells us, what was certainly the fact, that Wesley's preaching, far more intellectual and less emotional than Whitefield's, was responsible for much more terrible exhibitions of hysteria and that sort of thing—faintings, shriekings, convulsions, and the like. Wesley would seem to have been more superstitious than Whitefield in his resort to sortilege and in other particulars. In fact, when Wesley opened the Bible at a text which he interpreted as a command for Whitefield to stay in England, Whitefield sailed away as if there had been no heavenly interdict. Wesley's experience in Georgia, had Whitefield been aware of it, might have deterred him from going there as could not any chance-drawn Bible text. It is with evident satisfaction that Mr. Gledstone writes that Charles Wesley was so much a High Churchman that he made careful arrangements to be buried in consecrated ground, and was actually buried in the only corner of St. Marylebone churchyard that had not been consecrated.

The greatest injustice to John Wesley is that of withholding his opinion of slavery—"the sum of all villainies"—when Mr. Gladstone is frankly setting forth the relations of Whitefield to the peculiar institution. These, however, he does not obscure, but exhibits them in their unqualified ugliness; nor does he make any apology for them whatsoever. It must certainly suggest a doubt as to the reality of Whitefield's religiousness to find him using all his influence to break down the provisions hostile to the importation of rum and slaves into Georgia, and rejoicing in his success, himself purchasing slaves as a source of profit to his darling orphan asylum. The curiosities of piety have few more questionable examples than Whitefield's letters on this head. "But Providence," says Mr. Gledstone, "had a strange revenge for Whitefield's fault, for in the house next to that in which he died at Newbury Port [*sic*] Garrison was born, and over the ramparts of Fort Sumter, Charleston, S. C., from which the first shot was fired by the South on the Federal flag, Garrison . . . had the joy of seeing that flag raised again as the symbol of liberty for all, black and white alike." On the other side of the Garrison birthplace is the church in which Whitefield was buried. It is a stranger thing than the birth of Garrison in the shadow of Whitefield's tomb that from the English Evangelicals who were the sons of Whitefield's thunder, should have come Wilberforce, Venn, Macaulay, and their coadjutors in the destruction of West Indian slavery, and a sympathy which did much to encourage the American abolitionists in times of fiery trial. The absorption of Whitefield's influence into the Episcopal and other churches of England and America, in contrast with Wesley's creation of a new organization, is the more remarkable when we consider that, in the case of the Episcopal Church, Wesley's views were much more congenial to it than Whitefield's.

Whitefield's silly side towards women folk was not so abnormally developed as Wesley's, but his relations with them were sufficiently absurd. In his first wooing he "made no great profession," and assured the lady's parents that "his heart was free from that foolish passion which the world calls love." What he wanted was a good housekeeper; but the lady did not care to marry on such terms. Finally, he married a widow, ten years his senior, "once gay, but for three years last past a despised follower of the Lamb." Hers was at best only a semi-detached relation to the great itinerant. There was more humanity in his welcome to a little son, but not much when the child died only a week old: "I blessed the Father of Mercies for giving me a son, continuing it to me so long, and taking it from me so soon." And in many other places we seem to miss the accent of entire sincerity.

The Mental Functions of the Brain: An Investigation into their Localization and their Manifestation in Health and Disease. By Bernard Hollender, M.D., L.R.C.P., etc. G. P. Putnam's Sons. 8vo, pp. 507, plates xxiv.

Twenty years ago the possible determination of cerebral centres was still an issue. To-day motor areas are well mapped out, and surgery works backward from effects to causes when affording mechanical relief. Most psychologists draw a line between pure mental action and that which merely leads to muscular effort, because this may be induced by mechanical irritation in an unconscious subject. They would hold paralysis of the admitted speech-centre to bear upon the expression, not the function, of intellection, and are not willing to acknowledge thoughts and emotion-centres. Now the will may not lie in a motor centre, but it must be intimately connected with it, and, as Ferrier puts it, "the motor centres have a psychical significance, and form, as it were, the motor substrata of the mind." Perhaps the generally accepted doctrine may be expressed thus: A definite zone of the cerebral cortex is closely associated with motor functions, but this is also partly motor and partly sensory, and motion may not actually originate in it; and in effect the origin of motion lies in three positions, viz., (1) in the highest level of conscious thought, (2) in an area of the cortex technically known as the Rolandic, (3) in the gray matter of the spinal cord, so that automatic and memory motion may remain after the destruction of the area in which conscious thought arises. The literature of the subject thus recognizes general spheres of action, besides which well-defined local areas governing special outlying regions are acknowledged.

General medical opinion limits the functions of the cerebellum to those of co-ordination, and assigns the reasoning powers to the pre-frontal area, although some modern writers maintain that the intellectual centres lie in the posterior lobes. Indeed, the conception of the mind itself is not identical among all; some limit it to the understanding, while others, as we think with propriety, include the emotions or propensities which supply motives. Nearly all psychologists and alienists look upon the entire brain as the organ of the mind at large. They recognize that the judgment controls or is mastered by the emotions, as the case may be, and also that the intellect may be occupied with the highest problems of pure reason with which the emotions have no concern. But they do not teach that these various elements have specific habitats, and, notwithstanding that when the mind has been awry necropsies may disclose brain lesions, they do not yet assume to anticipate (except within very narrow limits) what mental consequences will follow local damage. Insanity presumes a diseased brain, but that such disease may be demonstrated in any particular lobe, or at all, is quite another matter. In fact, the latest American text-book teaches that: "As is true of mania, there is also no known pathological anatomy for melancholia. It is a functional disorder of the brain. . . ." That is, although the brain is the organ of the mind, such mental disorders pertain to the operation of the brain, not necessarily to its constitution. The mechanism needs regulating, not repairing; and this implies derangement of the entire machinery, showing itself sometimes in one and sometimes in another way. In other words, as applied to the mind at large, the character of a mental disorder cannot be deduced from any particular injury or local disease in advance of its manifestation. To this there are obvious exceptions, as when there is general softening or great destruction of brain tissue; but the foregoing may be accepted as the common doctrine of mental pathology.

Francis Joseph Gall (1758-1828), an enthusiastic and intelligent physician, was also an anatomist of painstaking and original observation. His great work on the nervous system, particularly of the head, is a treasure-house of important discoveries from which is drawn much of the medical science of to-day. It is hard to realize that when his investigations were begun, no connection between the brain and the mind was recognized, and even much later the Edinburgh *Review* said editorially: "There is not the smallest reason for supposing that the mind ever operates through the agency of any material organ." It must therefore be remembered that Gall was not only a scientific anatomist, but a discoverer in anatomy at the very head of the modern explorers of the nervous system, that he very

widely extended the realms of exact knowledge therein, and that what were his original demonstrations are now the common property of medical science. His observations led him to believe that the gray matter of the brain is the seat of all mental and, indeed, moral activity, that it embraces separate but associated centres, each possessing special functions, and that the growing brain moulds the skull, its protecting shell. Further, he sought to define these centres and to determine their development and retrogression under physiological and pathological influences. He particularly sought to compare regional brain development, as shown by the size and shape of the cranium, with the apparent mental capacity of the same subject, and thus to lay the foundation of a physiology of the brain. He invariably designated his study that of the functions of the brain. The term phrenology, which is good enough for the purpose, was an invention of Spurzheim's, which Gall did not use, nor, as taught by the inventor, accept as a system.

With no previous topographical anatomy of the brain surface upon which to define their provinces, his localizations were sometimes vague, sometimes inadequate. He determined the shape of the head that seemed connected with certain exaggerated qualities, and, reasoning *a posteriori*, gradually constructed a brain-plan consonant therewith. He did not at first try to analyze the fundamental power of any individual faculty or group. That is, Gall did not found a psychology; he endeavored to show that certain general regions, and in a few instances certain special localities, were endowed with particular powers, meaning to leave the work of filling in details for those who should come after. In so far as Spurzheim, Combe, and others attempted to analyze the different faculties, they built upon Gall's foundation. Whether this was well or ill is of no consequence here, but it is quite certain that that work was begun prematurely, and was carried on unadvisedly, to the great anoyance of the philosopher.

The author of the present work, of which the sub-title is "The Revival of Phrenology," presents a clinical record and analysis of eight hundred collected cases of brain disease, which, whatever one may think of the abstract doctrine, merit close consideration by those to whom the mental health of the community is intrusted. We think they go far towards maintaining the soundness of the general proposition, and they give hints for treatment during life, and furnish material for reflection after the termination of the case. Particularly interesting is the association central area of the parietal lobe. But to discuss the professional bearing of these records would be out of place here. We cannot say as much for the style of the book as for its matter. The composition is often marred by violence of expression, and its appearance is disfigured by a multitude of italicised words and sentences. The quotations are numerous and nearly all apt, but many cannot be verified for want of exact reference. Some of the plates are beautiful reductions from the great atlas of Gall, but others are irrelevant portraits of distinguished men, like Boccaccio, Fox, Cardinal Manning. The index is copious, but neither well arranged nor complete.

Essays and Addresses. By Augustine Birrell. Charles Scribner's Sons. 1901.

These papers would make the reputation of a new writer, but they will not add to that which Mr. Birrell has already acquired. The subjects are not generally such as to call for the exercise of that lightness of touch, that lambent play of humor, which captivated the readers of 'Obiter Dicta'; and when they are, as in the case of the House of Commons, we seem to detect a certain weariness, or at least a lack of the joyousness with which the author revelled over Gibbon or Benvenuto Cellini. Perhaps it was necessary to handle such worthies as John Wesley and Sir Robert Peel, such honored men as Bagehot and Browning, and such a contemporary as Froude, with sobriety; but while Mr. Birrell can write soberly as well as any one, we love him best when he is in his mood of merry mischief.

Is it because mysticism is incompatible with humor that Mr. Birrell's attitude has changed? To the ordinary mind, mysticism presents many incongruities, which to the mystic are sacred mysteries, not to be treated lightly. Certainly no one can read the essays entitled "The Christian Evidences," and "What, Then, Did Happen at the Reformation?" without feeling that Mr. Birrell is a sincere mystic. For, if these essays signify anything, it is that their author is more than half convinced of the truth of the doctrine of Transubstantiation. "Nobody nowadays," he says, "save a handful of vulgar fanatics, speaks irreverently of the Mass. If the incarnation be indeed the one divine event to which the whole creation moves, the miracle of the altar may well seem its restful shadow cast over a dry and thirsty land for the help of man, who is apt to be discouraged if perpetually told that everything really important and interesting happened, once for all, long ago in a chill historic past." The "tinkle of that bell" is "a sound carrying with it a richer freight of religious association than any other sound or incident of Christian worship." To a mind in this state, the Christian evidences, or Christian apologetics, constitute a dreary section of literature. "Paleyism is as dead as Queen Anne." Substitute "atmosphere" for "evidence," and Mr. Birrell is more at ease. To deny the existence of atmosphere in the realm of thought is "proof of blunted susceptibilities."

"It is obvious that a man who does not wish to break with Christianity, yet finds it out of the question to believe, in any downright honest sense, in the creed of Christendom, can find no shelter more convenient, less jarring and disagreeable, than an ancient, time-worn ritual, which gives dim expression to ghostly ideas, shadowy, symbolical, sacramental notions of sin, sacrifice, and atonement—ideas which possess the advantage of never coming into contact with the so-called realities of history, and elude as gracefully as a wreath of white smoke the grasp of proof."

Speaking reverently, it is obvious that a man who will believe this will believe anything—that is, anything that suits him. Nevertheless, the doctrine that truth is a matter of atmosphere has aspects that lend themselves to humorous treatment. No one could demonstrate this better than Mr. Birrell himself, were he in the mood for it; but, with his view of religion, even fetishism must be reverentially handled. In his essay on Bagehot—naturally most appreciative, for Bagehot declared in favor of mysticism—Mr. Birrell says: "It is a great shame, but one always remembers the playfulness of a writer—some purely human touch of his—so much better than one does his philosophy or history." We venture to say that the world will think it no shame to remember Mr. Birrell's playfulness long after it has forgotten his attempts at philosophizing and at rewriting the history of the Reformation.

A Dictionary of English and Welsh Surnames, with Special American Instances. By the late Charles Wareing Bardsley, M.A. Revised for the Press by his Widow. Henry Frowde. 1901.

'Bardsley's English Surnames, their Sources and Significations,' first appeared in 1873, and has been ever since the principal book of reference on the subject with which it deals. It ran through several editions during the author's lifetime. Though a number of other corresponding treatises have been subsequently written, none of them has ranked beside Bardsley's work, to say nothing of superseding it. But 'English Surnames' was never intended by the author as his final contribution on this theme. It was offered to the public rather as a preliminary study, a kind of report of progress, in the preparation of an extensive dictionary. For this larger work Canon Bardsley continued to collect materials almost up to the time of his death, in 1898, and his widow was busily occupied for two years more in preparing his manuscript for the press. The result of all these labors is the volume under review—a dictionary of some eight hundred closely printed pages, which attempts for the first time to deal in a fairly inclusive way with the history of English surnames. The introduction, written by the author in 1896, discusses briefly methods of investigation, and provides a general classification of the material in the dictionary. A preface, giving some account of Mr. Bardsley's life and work, is contributed by his brother, the Bishop of Carlisle.

In the field of study represented by this dictionary, completeness of treatment was hardly to be thought of. Many names will naturally be sought in vain in Mr. Bardsley's pages, and many variants of the names discussed are left unrecorded. Certain classes of names (as, for example, those which have obtained a special currency in Ireland because of their resemblance to Gaelic surnames) might, perhaps, have been more fully treated. But it will be easy for later compilers to add to the results obtained by the pioneer, whose dictionary will always remain a monument of industry and good judgment. He has not only brought together a great mass of material and placed it within convenient reach of the student, but his discussion of it is in the main very trustworthy. There must, in the nature of the case, be plenty of doubtful matter in such a volume. Mr. Bardsley, too, had certain limitations as a scientific etymologist—limitations of which he was well aware and which he expressly avows. Here and there a phrase or an observation betrays lack of philological training, as when he says, in his introduction, that *Sawyer, Napier,* and *Hathaway* contain an intrusive vowel "for euphony." This carries one back to the old explanations of the French *a-t-il,* with *t* inserted "for euphony" or "to prevent hiatus." But such statements

impair very slightly the value of the book, which is singularly free, on the whole, from the kind of errors that mislead students and check the progress of knowledge. Mr. Bardsley had no pet theories to which he tried to make his evidence conform. He showed no predilection for Norman derivations, like the author of 'The Norman People' (London, 1874), or for traces of Scandinavian influence, like Barber in a more recent treatise on 'British Family Names' (London, 1894). He collected his proofs impartially, and then spread them liberally before the reader, who is thus able to control him at every step. The more we have examined the book and sought to sift his evidence, the more we have been impressed both with the candid spirit of the investigator and with the really vast amount of special learning which he accumulated in his lifetime of labor on his favorite subject.

The Blessing of the Waters on the Eve of the Epiphany: The Greek, Latin, Syriac, Coptic, and Russian Versions, edited or translated by John, Marquess of Bute, and E. A. Wallis Budge. Henry Frowde. 1901. Pp. viii+158.

This little book, which has become a memorial to the late Marquess of Bute, may fairly be regarded as an appendix to his translation of the Roman Breviary. It connects with the note there in volume i., page 264, on the Feast of the Epiphany. Throughout, apparently, the universal Oriental Church there is celebrated, between the service of the Eve of the Epiphany and the day itself, a very singular and beautiful ritual which commemorates the Adoration of the Magi, the Baptism in Jordan, and the turning of water into wine at Cana. These are regarded as three different manifestations of Christ, and are brought together on this day. But the two latter manifestations are connected with water, and the Oriental Church has known how to weave them into a general blessing of the waters—in the first instance, apparently, of the waters of the world, as represented in a single river—the Nile in Egypt and the Neva at St. Petersburg; and, in the second, of water to be used for lustration. Whether we have here a survival of some fragment of nature-worship woven into the Christian service, or merely a development, through instinctive poetry, from that service, it might be hard to say. Of the beauty of the ritual there can be no question.

In the Roman Church until recently the same ceremony survived, and in equally striking, if hardly so naïvely poetical, form. But it was performed in certain churches only, and made no part of the regular ritual of the Church. Now all that has been cut away, and in 1890 a form was approved by the Congregation of Sacred Rites, which abandons entirely the usage of the Church, Eastern and Western, and turns this rich and many-colored office into a most ordinary form for the consecration of holy water to be used against evil spirits. The historical allusions are swept away with the feeling for Nature and her travailings, and we have instead some most crude magical formulæ. There is a mournful and not too dutiful tone in the note of the Marquess of Bute where he—loyal son of the Church as he was—draws attention to its "entire variance from the ancient form."

This book can be heartily commended, not only to students of liturgics, but also to all who care to trace the movements of faith. Our only regret is that the forms of the Abyssinian and Armenian Churches have not been added; as things are, these are inaccessible enough. That of the Gregorian Church of Armenia, with its pre-Monophysite attitude, and its celebration of the Birth at Epiphany, would be of especial interest.

The Great Deserts and Forests of North America. By Paul Fountain. Longmans, Green & Co. 1901. 8vo, pp. x, 295.

This is certainly an unusual kind of book. It appears to contain the reminiscences of an English travelling peddler and collector of natural-history specimens through various parts of the West and Southwest regions of the United States, at a period some twenty-five years ago. The author, by his own account, was, if not a cripple, at least somewhat infirm about the legs, and could ride only on a specially made saddle. While not illiterate (for his narrative, if unpretentious, is easy and pleasantly written), he was a man of no training in science, and his observations contain more and more varied misinformation than we have ever come across in any single volume in many years. Almost the whole book is devoted to observations on natural history. It is surprising how any man of such experience in outdoor life, love of nature, and obvious intelligence could have been so ignorant and so credulous as this narrative indicates. And yet he was no fool, and was possessed by the love of the open field and forest, never killed wild animals wantonly, and, we are convinced, must have been a delightful chum for a wagon journey out into the wilderness.

The book is a most interesting psychological study. The errors of observation with which it literally teems, and the absurd explanations of geological and biological facts are, of course, obvious chiefly to readers of some technical training. But if one can overcome his natural reluctance to spend time reading absurdities retailed in perfect good faith and modest complacency, the glimpse into the workings of a mind entirely uninformed in science, untrained to accurate observation, subjected to the impressions of the almost untravelled wilderness, and taking a hearty enjoyment therein, has a charm and a novelty rare in these sophisticated days. The book is, in many things, absurd; it is multitudinously erroneous; it is comical; yet it is pathetically interesting. When we are done with it, we feel an affection for the author, for we are aware that, in communicating his observations to the public without a trace of vanity or dogmatism, he has succeeded in giving us, all unconsciously, glimpses of a truly lovable soul.

Great Epochs in Art History. By James M. Hoppin, lately Professor of Yale University. Boston: Houghton, Mifflin & Co. 1901. Pp. 247.

Professor Hoppin's book is a collection of essays divisible into four distinct epochs of art history. Half the volume is devoted to Italian religious painting; the essays or chapters being arranged partly with reference to geographical subdivision, and partly by artistic subject. Thus, the chapter on the Franciscan Cycle is followed rather closely by one devoted to S. Gimignano, and one on Prato, Pistoia, and Arezzo. A very short division is devoted to the sculptor Scopas; another, hardly longer, to French Gothic architecture; and a discussion of English Pre-Raphaelites completes the volume.

The papers are of the nature of contemplative reëxamination of one's own experiences. During his twenty years' incumbency of the professorship of art history at New Haven, Professor Hoppin has seen much fine art, and has meditated upon its significance; and it may not be incorrect to characterize this book as a collection of those thoughts which seemed to him the most valuable, either separately or in their combination. The essay-like character of the book is explained in this way, and its lack of systematic treatment largely justified. It is, of course, better reading for the majority of readers—that is to say, for all those who have no immediate purpose in their consideration of art problems—than if the work were more scientifically constructed, and the thought evolved with more complete and more visible precision. The reader has, then, only this to complain of, that the very numerous quotations from modern authors with which the text is interspersed, are not credited to their authors. It is really a vexation when one finds a sentence of value printed as a quotation, to have its ascription limited to "a contemporary," or simply "a writer."

BOOKS OF THE WEEK.

Abbatt, William. Memoirs of Major-General Heath. William Abbatt.
Almanach de Gotha. 1902. Gotha: Perthes; New York: Lemcke & Buechner.
American Annual of Photography and Photographic Times Almanac for 1902. The Scoville & Adams Co. 75 cents.

The Collected Poems of
WILLIAM WATSON
With Photogravure Portrait. 12mo. Price $2.50 net.
THE LONDON SPECTATOR: "Here is true gold of poetry—the 'authentic airs' of Parnassus. The chief, the dominant characteristic of Mr. Watson's poetry is felicity—and felicity not merely of word and phrase, but of thought. He is not only happy in language, but in the ideas which he presents and interprets"
JOHN LANE, Publisher, 67 5th Ave., N.Y.

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has the largest circulation of any literary and political journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

AMERICAN GARDENS

EDITED BY GUY LOWELL AND ILLUSTRATED FROM PHOTOGRAPHS

To those who do not know what has recently been accomplished in garden-making in this country this book will come as a delightful astonishment; and showing as it does what can be achieved in America, and how existing conditions may be utilized, will prove a mine of suggestion. It contains reproductions of over two hundred specially made photographs which beautifully illustrate in detail sixty of our most charming private gardens, old (Colonial) and new, together with plans. The Introduction treats specifically of garden-design in America. Two hundred and thirty pages; 10 by 12 inches. Price, $7.50 net. Send for illustrated circular.

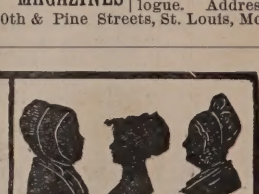
THE QUAKER:
A Study in Costume · · By AMELIA MOTT GUMMERE



An inquiry into the Clothes-Philosophy of this unique sect, utilizing both the portrait of the Quaker as he sees himself and the Quaker as others see him, in a painstaking endeavor to portray the Quaker as he really was. The world, the flesh, and even occasionally (it must be admitted) the devil, figure as origins for the Quaker's idiosyncrasies of garb. Quaker and worldly fashions have been studied on parallel lines.

A varied array of original sources in literature, of early records and other documents not easily accessible, and of quaint garments and trappings handed down from old Quaker families, has been laid under contribution in the preparation of this volume. The liberal use of illustrations of the latter makes the work a veritable museum of picturesque Quaker antiquities, yet every picture casts needed light on the argument.

12mo, printed on deckel-edged paper, bound in half ooze-calf, with a cover design in Quaker tints by Miss Amy Otis. $3.00 net.

For Sale by all Booksellers, or will be sent by mail, postage prepaid, upon receipt of the price by the Publishers.

SAFE MARGINS

for the most

EXACTING INVESTOR!

My life has been devoted to the study of property values in Minneapolis. Am in a position to give you the benefit of expertness in placing investments where both security and fair percentage may be relied upon. An opportunity is solicited of presenting facts which investors everywhere ought to know about.

Theodore Wetmore & Co.,
MINNEAPOLIS, MINN.

Kansas City, Mo.

The present condition of Kansas City is exactly suitable for purchase of city property. Prices of to-day guarantee appreciable increase. There is no surer city in the United States for investors to make money in real estate. We have been identified with the real-estate interests of this city during its steadily healthy growth and would like to tell a few Eastern investors how others have made money here, and how any one with a reasonably unprejudiced mind can do the same.

Choice loans on hand for sale at 5 and 6 per cent. interest.

Our responsibility is unquestioned.

Thayer-Moore Brokerage Co.

AN OPPORTUNITY.

Would you consider an opportunity to secure *a permanent annual income* by investing your surplus capital in such sums as you might desire? If, moreover, you were afforded *perfect security* and the *assurance* of more than the average interest or dividends, would you invest?

If so, we simply ask you to investigate the proposition offered by the

Isthmus Plantation Association of Mexico.

Full particulars will be mailed you upon request,
C. M. KENDALL, Gen'l Agent, 414-417 First National Bank Building, Milwaukee, Wis.

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The School List in the *Nation* has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

THE NATION, 206 to 210 Broadway, New York.

Page's Commonwealth Series

LITERARY growth in America has been of late years as rapid as its material and economical progress. The vast size of the country, the climatic and moral conditions of its different parts, and the separate political and social elements, have all tended to create distinct methods of literary expression in various sections. In offering, from time to time, the books in the "COMMONWEALTH SERIES," we shall select a novel or story descriptive of the methods of thought and life of that particular section of the country which each author represents. We believe the series will be of permanent value as a record, in a degree, of American life. The elegance of paper, presswork and binding, and the lavish and artistic illustrations, as well as the convenient size, add not a little to the attractiveness of the volumes. Each 1 vol., large 16mo, cloth, gilt top, profusely illustrated.....$1.25

No. 1. *Massachusetts.*

Her Boston Experiences

Seventh edition. By ANNA FARQUHAR (MARGARET ALLSTON).

"The first book for Bostonians to read on returning to their homes this fall is 'Her Boston Experiences.' It will do them good."—*The Literary World.*

"The book is really enormously clever."—*Boston Times.*

"There will be no brighter book published this season than 'Her Boston Experiences.'"—*New York Times.*

By JULIA MAGRUDER, author of "A Magnificent Plebeian," "The Princess Sonia," etc. Second edition.

A charming love story, the scene of which is laid in the Virginia of to-day. The plot revolves about two principal characters, a Southern heroine and a Northern hero; and the story is written in the author's usual clever style.

"Let us hope that Julia Magruder will not stumble upon a problem, but that she will go on writing love stories as long as we live, for she does write them delightfully. 'A Sunny Southerner' is as sweet and refreshing as a story can be."—*Buffalo Express, June 2.*

'Lias's Wife

By MARTHA BAKER DUNN, author of "Memory Street," etc.

There is the direct appeal of a story that has been really lived in this charming novel of Maine life. One essential merit of the book is its reproduction of the genuine New England atmosphere, with innumerable idioms quaintly delightful to encounter. The humor is pervasive and delicate, the pathetic touches equally effective. In short, one might search far for a more attractive tale than this romance of homely American life. The many admirers of "Memory Street" will read "'Lias's Wife" with even greater delight.

By ANNA FARQUHAR, author of "The Devil's Plough," etc.

There will be no cleverer book published this season than "Her Washington Experiences." The cabinet member's wife, through whose eyes we are given a glimpse into Washington society, has a vision delightfully true and clear; her impressions of the city as a whole, compared in character with other places, are well worth reading for their epigrammatic brilliancy and apt contrasts.

No. 4. *District of Columbia.*

Her Washington Experiences

BRITISH MEDITERRANEAN SERVICE

DOMINION LINE

BOSTON TO GIBRALTAR, NAPLES, GENOA AND ALEXANDRIA, EGYPT

S.S. Commonwealth (New twin-screw, 13,000 tons) **SAILS FEB. 12**

S.S. New England (via Algiers) (11,600 tons) **SAILS JAN. 25**

S.S. Cambroman (5,500 tons) **SAILS FEB. 26**

The steamships in this service are splendid ships of the finest construction, and offer the choicest accommodations. Service and cuisine perfect.

The **Commonwealth** is the largest steamship which has ever entered the Mediterranean. Send for Booklet, "The Mediterranean Illustrated."

Full particulars and rates furnished upon application.

Southern Railway to Southern Points.

To reach Florida and all Southern resort centers the through trains of the Southern Railway offer best and most luxurious accommodations. Offices, 271 & 1185 Broadway.

Twelve Trains Daily Between New York and the South via Southern Railway.

The sunshine of popular favor has now settled upon the Southern Railway; they have made their system one of the great steel highways of the world.

The gratitude of tourists who appreciate the acme of luxury in railroad travel is due in no small measure to this system. Their line of operation is the great nighway that leads to and through the Southern States. Year by year they have adopted every improvement that could add in any way to the comfort of that army of visitors who make their Winter home in the vast territory covered by its network of lines.

An example of the superb trains operated by the company is the "Southern's Palm Limited," which runs between New York and St. Augustine every day, except Sunday, during the Winter months. This magnificent train, the most luxurious in the world, runs through solid from New York to St. Augustine, excepting one drawing-room sleeping-car, which is detached at Blackville, S. C., and runs to Augusta, for the accommodation of travellers to this popular resort, and Aiken, S. C. The train is composed of Pullman compartment cars, drawing-room sleeping-cars, library, observation and dining-cars. Other fast daily limited trains are operated, carrying through Pullman drawing-room sleeping-cars to New York. Savannah, Jacksonville, Tampa, Charleston, Augusta, Asheville, Chattanooga, Nashville, Atlanta, Birmingham, Memphis, New Orleans, affording excellent service to Florida, Mexico, and the Pacific Coast. Dining-car service on all through trains. For further information call or address New York Offices, 271 and 1185 Broadway. Alex. S. Thweatt, E. P. A., 1185 Broadway, New York.

The Nation.

NEW YORK, THURSDAY, JANUARY 9, 1902.

The Week.

The Panama Canal directors had a meeting on Saturday, and voted to offer their property to the United States for $40,000,000, the price named by our Isthmian Canal Commission as the value of the property to us. There has been no doubt that the French company would come to this decision. The property they hold, except the Panama Railroad, is of no value to them unless they go on and finish the canal. But they cannot get the money for this purpose if the United States is building, or even contemplates building, another Isthmian canal. The logic of the situation has, therefore, been very simple ever since the report of our Commission was made. Logic equally requires that our Commission should now advise the President to recommend to Congress the acceptance of the offer. Assuming that the price asked by the French Company is satisfactory, the advantages of the Panama route are: (1) less cost by $6,000,000; (2) shorter distance by 134 miles; (3) smaller operating expense after completion by $1,300,000 per year; (4) natural harbors at both termini, which are wanting on the Nicaragua route; (5) a completed railway, which insures a prompt beginning of the work; two years would be required to make equal preparations at Nicaragua. These facts are set forth in plain terms by the Commission, and they have not been contradicted by the advocates of the Nicaragua route. The arguments in favor of the latter are mainly of the sentimental kind. We ought to build on the Nicaragua line because we have always intended to, because an American company began work there several years ago, and because it is the patriotic thing to do. We are told also that it is not wise to listen to the Panama offer because the railroads are pushing it forward in order to create delay—as though the railroad men would favor the shortest and cheapest line, and the one which can be operated at the smallest cost. Such fustian may carry the Hepburn bill through the House, but it is certain that that measure will not pass the Senate for mere reasons of spread-eagleism.

Senator Lodge's Philippines bill, which is to serve as a basis of discussion for the Senate and the House, is rather remarkable for what it fails to say than for what it says. It is, in effect, an enabling act, a kind of vote of confidence in the Taft Commission, to which it grants most of the powers specified in Commissioner Taft's recent report. "We trust our Commission," is the implication of the bill. "We intrust to it such troublesome matters as the government of Filipino communes, the disposition of public lands, the purchase of church property—in short, all these things we turn over in full confidence to our trusty Commission." The bill will undoubtedly be urged on these grounds. But is this Administration measure so complete a vote of confidence? Why, in either house, has no attention been paid to the most pressing recommendation of the Philippines Commission, namely, that the customs duties for the islands should be fixed at one-half the Dingley schedule? This was concrete. It regarded a more urgent situation than the making of highways or the purchase of church lands. Were the Commissioners sages when they spoke for the upland, but fools when they touched the gates of trade? The case, of course, is this: we are willing, in the difficult administration of these new possessions, to take any trouble that is not troublesome to a Senator or a Representative, or their constituents.

While no one can sympathize with soldiers who desert their flag and take service with the enemy, the document published on Saturday, signed by nine Americans, urging their fellow-soldiers to desert to the Filipinos, is one which cannot be overlooked. It is the Government's misfortune that the statements of these deserters as to the nature of the war of invasion being carried on in the islands are true. More and more testimony is forthcoming that the Filipinos are defending themselves against the American invasion "in the same manner in which our forefathers did against England in those glorious days of our grand and noble liberator, Gen. George Washington." While this document is plainly more than a year old, the rumors of frequent American desertions continue. One press dispatch recently attributed the stubbornness of the Filipino defence in Samar to the presence in that island of fifty American deserters, a hardly credible statement. None the less, it is a fact that an increasing number of officers and men in the service dislike what seems to them the hopeless task of subjugating the Filipinos, and think themselves fortunate when able to board transports for home. It is hardly necessary to say that the proper way for them to record their protests is by leaving the service properly and stating their views to the public.

Senator Hoar of Massachusetts delivered an address on "The Composition of American Citizenship," in the lecture course of the Young Men's Catholic Association of Boston, the other evening. Incidentally he expressed the opinion that the greatest honor ever paid to any nation in this world by another was the declaration by Japan, last summer, that she owes everything she is to us. He said that he deemed the two most glorious actions in our history, and among the most glorious actions in all history, to have been the declaration of our own independence, and the raising of Japan to her feet among the nations of the earth. He proceeded to declare his disbelief that "the American people are to be permanently in a frame of mind to blot out or wipe out either," and he considers that we have made temporarily a terrible mistake in departing from our traditional policy in the Philippines. On this point he spoke with great clearness and cogency:

> "I believe that, if our republic, with its might and irresistible force, had done with the Philippine people as we had done with Japan, its action would have found a response in what is best, and not in what is worst, in human nature. They would today be listening to our counsel, and informing themselves by our example. Their schools and universities would be filled with youth studying our language and history, fitting themselves to learn the great and noble story of the men who builded this republic. We should already have made of them a brave, honorable, and noble people, looking upon the present with satisfaction, and upon the future with hope. If, instead of that, they are exhibiting the traits which belong to weakness and subjection, it is we who are largely responsible. If the Filipino be treacherous, it is we that have made him treacherous; if he be cruel, it is we that have made him cruel; if he be savage, it is we that have dashed the cup of liberty and civilization from his lips."

Mr. T. Estrada Palma has been elected the first President of the Cuban Republic. In the eyes of Americans he ought to be the one best fitted to fill that position. He was the man who did most to enlist their sympathies in the movement to expel Spain from the island. Even those who did not approve of the war itself, were compelled to acknowledge that Mr. Palma was the chief organizer in this country of the public opinion which carried Congress off its feet and finally forced Mr. McKinley into the war party against his will. Therefore, Mr. Palma has a claim to be heard in the present crisis of Cuban affairs. In a widely published interview he says:

> "I will ask, with every expectation of the request being granted, that a reasonable reduction shall be made in the duty on sugar and tobacco, the two staples of Cuban agriculture. If this reduction is granted, the prosperity of Cuba will be immediate and great. If it is denied, it will mean ruin. There will be $500,000,000 employed in the sugar and tobacco industries, all of which will be lost if the American door is closed. The fields of Cuba will be desolated, and the sugar mills will be ruined just as thoroughly as they were by the Spanish incendiaries."

It is to be hoped that means will be

found to extend the needed relief at once. This is not the proverbial case where he gives twice who gives quickly, but one where he who does not give quickly gives not at all. The help must apply to the present crop. If we wait till next June, we might as well wait till next January. Bankruptcy and despair will overtake the planters; beggary and starvation will be the portion of their laborers. We have deprived Cuba of her Spanish market, and have not given her anything in exchange for it. We owe her at least what we took from her, and we are bound in honor to pay the debt in time to save her from ruin.

Germany's "little bill" about to be presented to Venezuela at the point of a bayonet, is, in part at least, made up of private claims of German citizens, and of defaulted interest on Venezuelan bonds. It is thus not wholly a question of infringement of the rights of Germans in Venezuela, or of the failure of the Venezuelan Government to live up to its contracts with foreigners. It is really this aspect of the matter, rather than a supposed disrespect for the Monroe Doctrine, which makes the German attitude important from the point of view of international law. No one questions the right of a nation to interfere for the purpose of collecting debts due its subjects abroad; but it has not hitherto been considered good policy to do so. England has washed her hands of such undertakings, on the ground that it would lead to endless friction, and keep even her great navy too busy. An unofficial council of foreign bondholders has existed for years in London, mainly to attend to exactly such delinquencies in South American and Oriental countries as Germany is now complaining of in Venezuela. If the German Government is deliberately to turn itself into a debt-collecting agency, it will have its hands full.

Advocates of the extension of the referendum will find little encouragement in an analysis of the official election returns from the four States in which Constitutional amendments were submitted in November. In none of the four States did one-third of the voters who went to the polls express their views on the proposed amendments. In Pennsylvania, where the campaigning was exceptionally earnest, the largest proportion, nearly 31 per cent., was recorded; but in Maryland only about one in five of those who voted showed any interest in the amendments, and in Virginia only about one in eight. Comparison of the vote in New York is not feasible, as the tickets bore no nominee for a State office, but in New York County the total vote on the amendment rose to the unusual proportion of 55 per cent. of the vote cast for Mayor. In Virginia the voters had the excuse that their labor might be in vain, as a Constitutional Convention was in session; but as to the other States, the only explanation is the ignorance or indifference of a large majority of the voters.

In some of the large cities to be specially affected by the approval of the pending amendments, a greater measure of interest was shown, and yet in those cities the Aldermanship of a ward was a more engaging issue than even a measure for the purification of the ballot. There appeared, too, the usual variation in the votes for the several amendments, according to their order on the ballot, even when one amendment was cognate to another. Thus, in Baltimore, where two amendments, affecting the representation of that city in the Legislature, necessarily went together, one received about 2,500 more votes than the other. Three of the counties in the State ratified one of these amendments and rejected the other; and if the entire State had voted that way, much confusion would have resulted, and Baltimore might have been deprived for a time of all representation. As it was, the amendments were approved by the large vote in the city—about 41 per cent. of the total—against a small adverse vote in most of the counties, and the Constitution was changed in an important particular by the affirmative vote of about 33,000 electors out of nearly 300,000 persons on the registry lists.

Those trades-unionists who have impugned the motives of the labor delegates to the recent meeting of the National Civic Federation must find their extreme views rebuked by the report of Mr. Gompers concerning the objects and work of that body, for it is unusually wise and moderate. While he stanchly upholds what he conceives to be the rights of labor, he admits that the new movement cannot be expected to abolish strikes and lockouts. All that can reasonably be looked for is that some such conflicts may be avoided when capital and labor mutually recognize each other's rights to a greater degree than they now do. One point of special interest in Mr. Gompers's report is his opinion of compulsory arbitration. The demand for such arbitration, he says, comes from "some mistaken friends" of the labor movement. The whole trend of his remarks is against State interference in industrial conflicts, and in favor of voluntary settlement of labor disputes by methods of conciliation.

Mayor Low's message to the Board of Aldermen illustrates once more the skill with which this shrewd student of municipal problems strikes at the very heart of the matter with which he has to deal. Postponing for a month a thorough discussion of city affairs, he devotes his opening address entirely to the question of blackmail in the conduct of the government, and declares that against this iniquitous system in all its forms his Administration will wage open war. He announces that no citizen or employee, from the largest corporation to the poorest bootblack, need pay one dime for protection from harm or for securing just treatment at the hands of the city government; he promises that the whole force of the Administration will be exerted, "continuously, aggressively, and in every possible way," to prevent and punish this sort of iniquity; and he asks the coöperation of the citizens and of the city employees in breaking up "the whole foul system." There is something inspiring about this ringing appeal to the public, "for the city's sake and for democracy's sake." Nothing about the new city Administration is more refreshing than the relations of frankness and openness which have already been established between the officials and the people. Not only have the Mayor and the heads of departments nothing to conceal; they are glad to take the public into their confidence, as Mr. Low did in his statement on Friday evening about the reported attempt by Tammany to secure control of the Board of Aldermen by bribery. The same spirit is manifested all around.

District Attorney Jerome has already begun an inquiry into the corrupt methods of furnishing supplies, and particularly hose, to the Fire Department, for which Commissioner Scannell and his go-between, Marks, were indicted. His action in referring the matter to the Municipal Affairs Committee of the City Club indicates a praiseworthy intention to utilize this and similar public-spirited bodies, like the Merchants' Association, in his effort to improve municipal conditions, so far as it is his duty and opportunity to do so. President Cantor and Superintendent Stewart have already signified a like intention of consulting the various architectural and fine-arts leagues and other bodies which exist for the improvement of the city. The Low Administration has wisely recognized the fact that citizens have a right to be heard in these matters, and that there is no excuse for the neglect and indifference with which protestants were treated by the Van Wyck Government. By calling in public-spirited organizations to help in beautifying the city, or in finding out the corruption in the various departments, whether in supplying asphalt, stone pavements, or fire hose, the new city and county authorities have hit upon one of the best ways of enlisting public sympathy and guaranteeing the thoroughness of their work.

The constant vigilance which is the price of civic beauty is illustrated in Paris in a movement to encourage the production of artistic signs. Initiated by the eminent military painter Detaille, the idea has been received favorably by the civic authorities, and there is every likelihood that some of the best painters and sculptors in Paris will lend their assistance to the work. There has of late been a feeling that Paris, beautiful as it is in its proportions, has become too uniform and monotonous. The present Prefect of the Seine has somewhat relaxed the strict censorship of the façades of new houses, in the hope that the city will gradually regain the picturesque aspect which it had before the Haussmann dispensation. The movement for artistic signs is inspired by this same spirit. M. Detaille feels that if the tradesmen will generally return to the habit of putting out distinctive signs, painted or sculptured, and the best artists will lend a hand, this will be the ideal manner of bringing art to the people. The idea is an admirable one, but its execution will involve a curious paradox. To have painted a sign-board, as many artists have done, is to a great artist what to have been a barefoot boy is to a multimillionaire. The Parisians may yet see grave members of the Institute repeating, out of sheer public spirit, the tasks to which formerly only sheer necessity could have driven them.

Comptroller Coler has been the most interesting figure of the municipal Administration which is just retiring. He began his career as a surprise, developed into a mystery, and ends as a disappointment. Mr. Coler was unknown to the city when he was nominated on the Tammany ticket in the autumn of 1897, and not much was expected of him when he was elected. But he turned out to be a most industrious official, whose activity was for a long time exerted in the public interest, without any evidence that he was trying to serve personal ends. His prompt and earnest opposition to the Ramapo job was of immense value in arousing the public and in solidifying sentiment against the swindle. His exposures of Tammany extravagance were also illuminating and serviceable. In fact, if his term had been only two years, he might have retired at the end of 1899 with a splendid record. Ambition for higher office overcame him. Until some time after the opening of 1900, he regarded it as his duty to serve out the term of four years for which he had been elected, and considered that it would be a breach of his obligation to the people if he should surrender the place to Tammany. But the passion for advancement took possession of him, and a few months later he actively sought the Democratic nomination for Governor. This exposed him to the suspicion that he had been "playing politics" in his reform work, and aroused such doubt as to his political stability that he could not be seriously considered for the anti-Tammany ticket, a year later. His career has thus proved somewhat disheartening, and it must serve rather as a warning than as an inspiration to young men.

Senator Stranahan has promptly followed up Gov. Odell's suggestions for a mortgage tax, and the plan of a recording tax of 50 cents per $100, in lieu of any annual assessment, is now formally before the Legislature. If the proposal affected a situation in which mortgages were not taxed at all, theoretical objections might be decisive. But the truth is that the situation as it exists to-day has become almost intolerable. Mortgages are not only taxed, but taxed with the greatest unfairness and irregularity, and at a rate nearly five times as high as the proposed recording tax. We have had instances called to our attention where small estates, restricted by testamentary proviso to investment in high-grade mortgages, have been assessed on personalty virtually to the full face value of the mortgages. This, it will readily be perceived, was tantamount to an income tax of 50 per cent. or thereabouts, and it could not be sworn off or reduced. One of the results likely to flow from the new mortgage tax has been pointed out by Mr. F. D. Tappen in an interview in the *Evening Post*. Under the present law, trustees and executors are practically prohibited from investing in mortgage loans the funds in their hands. The rate of interest on such mortgages is usually not above 5 per cent., and not above 4½ per cent. on city property. The tax is upwards of 2 per cent. It takes one-half of the income from the mortgage to pay the tax, because trustees and executors cannot escape paying it. On the other hand, mortgage loans made by savings banks and life-insurance companies are exempt, and those made by individuals, other than executors and trustees, generally manage to escape. It is Mr. Tappen's belief that, if the record tax were adopted in lieu of all other taxation on mortgages, a large amount of capital which is now withheld from it would seek that form of investment. Trustees would no longer be deterred from it. Private individuals would invest their own money in mortgages more freely than before, because a menace would be removed. The effect of new supplies of capital for mortgage investment would be to lower the rate of interest, to the advantage of the borrower.

There is not much to be said of the Crude Rubber Company's collapse, except that it adds another chapter to the story of 1899's financial delusions. We say delusions, because, quite irrespective of the merits of the enterprise *per se*, its confession of insolvency shows it to have been founded on last year's wildly exaggerated hopes and theories. The company was not organized in the period of highly expanded prices; in fact, it came into being when rubber market quotations were hardly as high as they are to-day. But the infatuation as to the permanency of high commercial prices, which caused so many companies to heap up original liabilities in excess of what the future could provide for, induced the crude-rubber combination to incur fresh liabilities, under the same delusion. Rubber, the company's managers inform us, sold as high, a year or more ago, as $1.15 per pound. On the basis of something like this were incurred the heavy liabilities which have resulted in the company's suspension. The rubber market is now down to something like 85 cents; the company's large holdings of material, bought at the higher prices, have had to be liquidated at such figures as have wiped out the company's capital and profits, and forced it into insolvency. As we have said, this episode differs somewhat from that of other concerns in which the exceptional trade prosperity of the moment was, so to speak, capitalized at the expense of the general public. But the delusion as to prices did the mischief in the one case as in the other.

Electoral reform is under discussion in the French newspapers, and while the Ministry is as yet uncommitted to any definite revision, the abuses of the present system must eventually call for legislation. The chief weakness of this system lies in the fact that each arrondissement, however small, is entitled to a Deputy, which leads to the most startling inequalities of representation. For example, the Third District of the Arrondissement of Nantes has 35,519 voters; the Arrondissement of Barcelonnette has 3,479. Each returns its Deputy, and each voter in the obscure Alpine village counts for ten in the large city. Not only does this inequality affect the membership of the popular Assembly, but it is the worse because the arrondissement, unlike the State with us, is not a political, but an administrative unit. It elects no officers, and has practically no political powers, but is a mere administrative division of the department. That this purely arbitrary division should be allowed to vitiate the principle of equal representation is one of the many absurdities which have resulted from the Revolutionary régime, when the political map of France was made over irrespective of history and in deference to a false logic. While it is doubtful if so radical a plan as that for minority representation proposed in *Figaro* by M. Jules Roche will be advanced, it seems probable that the question of electoral reform must be seriously considered by the Parliament now in session.

OUR IMPERILLED EXPORT TRADE.

In a special financial supplement, the *Evening Post* published on Tuesday week the opinions of a number of representative men concerning the business outlook of the coming year. The first one in the order of presentation was that of Secretary Gage, who consented to answer a few questions. Mr. Gage thinks that the prosperous conditions of the past year have not suffered any check; that our foreign trade will be maintained at its present volume, provided that we study intelligently the wants and habits of our customers abroad; provided, also, that we bear in mind that all trade is barter, and that we cannot continue to sell unless we buy. This is a pregnant thought, and was peculiarly appropriate in this locality at the moment it was uttered. On Thursday, the New York Chamber of Commerce emphatically voted resolutions, about treaties of reciprocity, which are really an alarm sounded by the closest and most interested observers of our foreign trade. They are active business men who, in their federated capacity, know no politics and swear by no economic theories. Their only concern is to promote the city's and the country's commerce. They might, as logicians, condemn the self-contradictory resolves of the Reciprocity Convention at Washington, but it is really in the guise of merchants that they speak their minds on that subject. What they say is, that a reciprocity which is terrorized by protection is not only a sounding brass and a tinkling cymbal, but is an immediate peril to our export trade. For these clear-sighted watchmen on the walls plainly perceive that the great industrial and commercial need of this nation is "new and wider markets for our products," and that the failure to secure them by reciprocal trade arrangements means not only that we shall get no added openings, but that we shall lose those we already have. The course of the head-in-the-sand protectionists and of the reciprocity advocates who take away with one hand what they give with the other, is, asserts the Chamber of Commerce, "likely to invite hostile legislation on the part of other nations against this country, to the great detriment of its commercial interests."

Such hostile legislation is not merely invited. It is openly advocated abroad. It is, in at least one important case, already formulated. The new German tariff, if enacted, will deal a heavy blow to the agricultural exports of the United States. Crushingly high duties will be laid on wheat and beef and pork products. The present duty on wheat is 3½ marks the metric cwt. of 220 pounds; the proposed duty is 6½ marks. On bacon the increase is from 13 to 35 marks, on pork from 17 to 30 marks, and on other meats from 15 to 30. Now, in 1900 we sold to Germany $6,495,000 worth of wheat and $2,700,000 of wheat flour, more than $2,000,000 of bacon and ham, and as much more of pork and other meats. Our cotton exports to Germany were, in the same year, of a value greater than $63,000,000. How much we ought to dread hostile legislation affecting this important export trade is obvious at a glance. What will Western and Southern Congressmen have to say to their constituents, what will the President have to say to the country, if supineness or sullen greed is allowed to imperil our foreign export trade?

The thing to keep clearly in mind is that hostile German legislation has not, so far, passed from threats to actual blows. The contingent aim of the higher duties was most distinctly set forth by the Chancellor in his speech to the Reichstag when laying the bill for the new tariff before it. Von Bülow said in so many words: "The new tariff is intended to supply a *better weapon* for conducting the negotiations for future treaties of commerce with other States." It did not mean, he asserted, the "abandonment of the policy of commercial treaties." It must be, he affirmed, "the most earnest endeavor of any responsible statesman to arrange treaties of commerce on acceptable conditions." But if treaties could not be arranged, why, there were the high duties for the products of foreign countries which stubbornly maintained high duties against German goods. Bismarck himself could not have been more explicit in laying down a policy of *do ut des*.

The danger to our trade in Germany is only a little more evident than in other countries. Austria will be inclined to enact tariffs against us, as soon as the Reichsrath can pull itself together to pass any laws at all. France knows the trick of maximum tariffs, and is ready to use them against us. As for Canada, her statesmen are rapidly passing over to the position that it must be either a treaty of reciprocity with the United States, or a hostile tariff that will cut our exports in two. As the Hon. John Charlton, M. P., writes in the January *Forum:*

> "Canada can give to the United States a kind of reciprocity that will make the volume of imports from that country nearly as lean and hungry as is the present scale of exportation to it. The simple formula for securing this result is to adopt the American tariff; and Canada is rapidly settling down to the conviction that there should be no unnecessary delay in taking this course, if proper concessions cannot be obtained."

These are but specimen clouds on our trade horizon. In them the Chamber of Commerce sees the promise of a disastrous storm. It is easy to pooh-pooh its words of alarm; to say that its members are only importers who are insidiously attacking the sacred tariff. They really are exporters as well as importers —exporters because they are importers— and their main anxiety just now is to avert a peril to our export trade. They are thinking of the farmer in the West and South, because they know that if his exports are checked by hostile legislation abroad, their imports will also be checked, and the general prosperity of the country impaired. Theirs is the plain business view of the situation. What, meanwhile, are our legislators at Washington doing? They are mumbling, with Senator Cullom, about their devotion to "the general principle of reciprocity," provided it does not run counter to "the general principle of protection." That is, they would be most happy to go North, if they could do it while walking South. If they had real statesmanship, they would be at least as far-sighted as business men, and would see to it that a stupid persistence in an outgrown and offensive and perfectly needless system of protection did not prevent this country from marching forward to that industrial and commercial conquest of the world of which it is capable.

THE GOVERNOR'S MESSAGE.

Gov. Odell's second annual message to the Legislature strengthens the impression which he has made during his first year in office. It is the work of an Executive who is, first of all, a business man, and who treats the affairs of the commonwealth from the standpoint of an administrator of a great corporation, in which the taxpayers are the stockholders. The Governor presents a very encouraging view of the State finances. The State debt, including the amount incurred for canal enlargement a few years ago, is only a trifle more than $10,000,000, and there was a balance of cash in the Treasury at the close of the fiscal year (September 30, 1901), of nearly $10,000,000. For the current fiscal year the revenues from indirect taxation are estimated at $15,000,000, leaving about $5,000,000 to be provided for from other sources. Of this sum, $4,200,000 can be taken from the surplus on hand. Therefore it is necessary to raise but $739,299 from the general property tax during the current year, and this is rendered necessary only by the Constitutional requirement of thirteen one-hundredths of a mill for the sinking fund. In other words, we have very nearly reached the ideal condition for which tax reformers have been so long striving, where the State can renounce direct taxation entirely, and leave the county boards to adjust their local taxation in their own way. Of course, the surplus in the Treasury now can be used only once. Therefore it is still necessary to provide a few millions from other indirect sources before the desired balance will be permanently attained.

The Governor makes some specific recommendations under this head which we think will command general approval. The measure to tax mortgages,

which failed as presented in the Stranahan bill, is brought forward in a new shape. It proposes to subject mortgages not to a yearly tax, but to one tax, which may be called a recording tax. The Stranahan bill proposed a tax of five mills per annum. The Governor proposes a tax of five mills for recording the mortgage, and nothing afterward. The total amount of mortgages annually recorded in the State is about $600,000,000. The proposed tax would therefore yield $3,000,000, and this sum would almost close the gap which remains to be filled in the State revenues from independent sources. Those who are opposed to any tax on mortgages will oppose this. They will say that, no matter how the tax is levied, it will fall upon the borrower, since the lender, in this case, will deduct from the amount of the loan the sum needed to pay the recording tax. Granted; but the rate of interest is on the down grade, and this tells in favor of the borrower. Is it not right that the State should share in this advantage? This tax should be in lieu of the present tax on mortgages —the tax which, as the Governor says, reaches only the mortgages in the hands of executors and trustees, while individual holders escape it entirely.

Another suggestion in the message relates to the taxation of companies incorporated in other States, but having their offices and doing business in New York. This is the weightiest part of the message in its financial aspect, and the one which will cause the greatest public satisfaction. Hitherto the State has assumed that "foreign" corporations (meaning those of other American States) are taxed at the place of their domicile. Consequently, the shares of such corporations are non-taxable in the hands of a citizen of New York. This is theoretically the right system, but it was never intended to apply, and ought not to apply, to companies which go to New Jersey, or Delaware, or some other easy-going State, to procure a charter, while carrying on their principal business here. They do this to avoid their fair proportion of the tax which they ought to pay for the protection that the State and municipal governments of New York give them. Moreover, they make no concealment of the fact that this is the reason why they seek charters in other States. They say that they do so because the burdens of taxation in New York are so heavy. The burdens in New York are not heavy; but, whatever they may be, they are enhanced to the citizens who do pay by the amount of capital withdrawn from our own corporations and invested in those of New Jersey, Delaware, etc. This transference is a form of cheating which has received the sanction of law. The corporations are not to be blamed for taking advantage of the law as it exists. Their leading counsel naturally advise them to go to the cheapest market for their charters. They would be fools if they did not, but it is time for the State of New York to demand her just share in this harvest. The specific recommendation of the Governor is very moderate. It is that foreign corporations doing business here shall be required to file a certificate of their incorporation and pay annually a tax of one mill per dollar as a franchise tax. On condition of doing so, their stockholders resident in New York shall be exempt from taxation on the shares so held by them. This addition to the public revenues, and the proposed tax on the recording of mortgages, would supply the needful amount to make the State independent of the direct or general property tax. If Gov. Odell succeeds in accomplishing this aim, his Administration will be a memorable one from the business point of view.

We must pass over the Governor's important recommendations regarding the State institutions. Quite in line with the business sense which prompts his questioning of present methods is his protest against the abuses of our system of receiverships for insurance and banking corporations. We heartily endorse his recommendation that all proceedings affecting such corporations under the Banking and Insurance Departments shall be under their control during the liquidation, which should do away with the excessive fees that are now generally extorted. Mr. Odell's practical sense is shown in his advice that the code be amended so as to compel the argument of appeals in capital cases within six months after conviction; that the Governor be empowered to assign justices of the Supreme Court to districts where they are especially needed; and that it may be wise to allow the temporary designation of county judges to trial terms anywhere in the State whenever necessary to clear the calendar.

As will be seen, this message is fruitful in valuable recommendations. The paragraphs under the head "Home Rule for Cities" will be read with great interest, because they embody the Governor's ideas regarding excise legislation at this session. It all comes to this—that, while the Legislature might extend local option on the liquor traffic for weekdays so as to cover cities as well as towns, he thinks that no measure for local option on Sunday traffic should be passed unless the question be first submitted to the people of the whole State whether they will approve the idea of allowing such a departure from the fixed rules which have hitherto prevailed throughout the commonwealth, and a majority do so approve. There are no signs whatever that a movement for such a State referendum will be pushed, and, as the Governor commits himself against anything else, this means that nothing will be done by the present Legislature about Sunday saloon-opening.

MORE BISMARCK REVELATIONS.

"He spares me no shocks," said Bismarck once, referring to the Emperor William I., "and I should be all the better without those little letters in his own handwriting which he does me the honor to write." Two or three hundred of these little letters are contained in the Supplement to Prince Bismarck's 'Recollections,' lately published in Germany ('Anhang zu den Gedanken und Errinnerungen von Otto Fürst Bismarck'). These missives from monarch to Minister are mostly hurried notes of birthday and anniversary greeting, often announcing presents or new honors for Bismarck, and are, in general, of small account, either political or literary, with their characteristic interlarding of French idioms and phrases. How the grandson has *changé tout cela!* But at two or three places in the correspondence (for many of Bismarck's replies are given) we see a suggestive lifting of the historic curtain.

New light, for example, is thrown upon one of the disputed points relating to the war with France. This is the renewal in 1870 of the candidacy of Prince Leopold for the Spanish throne after it had been, on French protest, officially abandoned in 1869. When Bismarck wrote about the matter to Marshal Prim, he said: "Pray do not forget that the King is supposed to be ignorant of all this." This has been taken as a clear proof of the duplicity of either Bismarck or the King, or both. But a letter now printed from William, under date of February 26, 1870, makes it clear that, in the beginning at least, he was a total stranger to the plot to wave the Spanish red rag again in the face of France. He wrote to Bismarck:

"The enclosure [not given] comes upon me like a bolt out of a clear sky. A Hohenzollern again a candidate for the throne of Spain! I suspected no word of this, and only lately was jesting with the Prince about the earlier bringing forward of his name, and both of them [father and son] dismissed the idea as a mere joke. When you have got the details, we must have a conference, although I, as head of the house, am *against* the affair."

Of course, the affair went on, nevertheless, and the world knows now how deliberately and astutely Bismarck employed the Hohenzollern candidacy to infuriate the French and make them declare that war in which he was burning to engage, if only he could avoid appearing the aggressor. A diplomat in Berlin said to Mr. Charles Lowe that he had heard Bismarck exclaim, in a moment of heat, "Oh, I have had experience in making other countries declare war upon Germany!" The Hohenzollern Spanish intrigue was one of the cases in point. We know now how Bismarck and Von Roon fairly forced Prince Anthony, on public grounds, to put forward Leopold again, and also how thunderstruck Bismarck was when the King telegraphed him from Ems that the candidacy was

once more withdrawn and the whole trouble apparently settled. The disappointed Minister was about to resign and go back to Varzin for good, when his chance came to "edit" the famous later dispatch from Ems, and so get his war, after all. In the whole matter, it is now evident, he left his royal master very much in the dark, and worked secretly behind his back.

The other important revelations of the letters relate to the crisis of 1875. Early in that year Europe took alarm at the apparent intention of Germany to attack France before that country could get upon her feet with the new and enlarged army she was planning to create. The Berlin *Post* had an inspired article, as it was taken to be, "Is War in Sight?" All the talk of the General Staff was of provocation, anxiety, and impatience. An Imperial order suddenly forbade the exportation of horses from Germany. Moltke said openly to the Belgian Minister, "They may say what they like; I look only at facts. France has just added 144,000 men to her army. That means the offensive within a short time, and we ought not to wait for it." All these ominous signs, with the indiscreet babblings of Herr von Radowitz, supposed to be deep in Bismarck's confidence, were reported to Paris by the French Ambassador at Berlin, and led, as the Duke de Broglie states in his book, 'An Ambassador of the Vanquished,' to prompt representations by the French Foreign Office to both the English and Russian Governments. What the Czar and Gortchakoff did, leading up to their grandiloquent dispatch, "The maintenance of peace is now assured," has been published. We have Bismarck's own sneering account of their fussy and needless intervention, as he calls it. What England did to avert the threatened war has not been so clearly known. A letter of the Emperor's to Bismarck tells much, and suggests more.

It bore date of August 6, 1875, and, in the midst of some unimportant matters, gave extracts from a correspondence which had passed between the Kaiser and Queen Victoria, and of which he did not think it right to leave his Chancellor in ignorance. The royal letters had related to the threat of war with France, and William had assured the Queen that there was nothing in the alarmist rumors on that subject; that it gave him pain to suppose that she thought of himself as a disturber of the peace of Europe, since he was convinced that no one could provoke a war without exposing himself to the execration of the civilized world. Thereupon the Queen replied, so he wrote to Bismarck, that, "without my knowing it, others besides Moltke who were very near to me had openly talked of attacking France. But she would not go farther into the matter, since the whole had now fallen into oblivion." The Emperor added that he had written to thank the Queen for her friendly letter, and to say that "as she had named no names, he would make no further investigation." "I'm so sorry!" (*thut mir leid*) was, at this point, written in Bismarck's own hand upon the manuscript of William's letter.

The Chancellor's reply, a week later, is a masterpiece of evasion and cynicism. It would have been highly interesting, he said, if the Emperor had urged the Queen to give him the name of the threatener of war. That exalted lady must be very sure of her ground to have taken so weighty and so unfriendly a step. However, suggests the innocent Bismarck, she can have referred only to Count Münster, the German Ambassador in London. That diplomat, we may add, indignantly denied later that he had been guilty of any war talk, indiscreet or calculated. But Bismarck goes on to defend both him and Moltke, on the ground that their remarks about the advantage of speedily attacking France were purely "academic," and were intended merely to let the French know that they could not count upon immunity under all circumstances. The English Government would be wholly wrong in taking the unofficial language of an Ambassador so seriously, and hence he thought that Queen Victoria must have had "other grounds" (a clear reference to the hated Englishwoman in Berlin, the wife of the Crown Prince) for believing the rumors of war to be true. Nowhere does Bismarck intimate that he thought himself suspected, or deny that war would have been forced but for "the pressure of other Powers" brought to bear upon Germany by this unfriendly English initiative.

Did he really wish and intend another war with France in 1875? Was his anger at Russia, on whom he took sweet revenge at the Congress of Berlin, simply because of her interference with a deep game of his, or because the firm attitude of the Czar actually prevented a war? We may never know. Bismarck's diplomacy was confessed by himself to be wholly unscrupulous, and it was often so tortuous, so subterranean, so fertile in alternative expedients, that one can never be sure that his avowed aims were his real ones. A very remarkable letter of his to the Emperor, now first published, betrays his moral point of view, and his method. It related to the charges of double-dealing brought against him by the Italian Gen. La Marmora, in connection with the events of 1866. Why, said the honest Bismarck, who "feared nothing but God," the "only way in which I could thwart the policy of Napoleon was to make it clear to Benedetti and the Italians, who kept nothing from Napoleon, that I was perfectly willing to wander from the path of virtue, and only needed time to win over your Majesty." This manœuvre, he adds, was "very useful," and he quotes with gusto an old French proverb—"a pirate and a half to catch a pirate"—which his antagonists should have had in mind. From the whole body of Bismarck letters in the two volumes, in fact, one bears away a deepened impression of the man's extraordinary force, of his unrivalled intellectual power, and of his relentless grinding on his way to his goal, with the rush, and with about the morality, of an avalanche. His greatness, the immense rôle which he played in history, no man can doubt; but his lack of the finer personal and moral qualities, above all a certain want of magnanimity in his attitude towards his colleagues and successors, becomes clearer with every fresh publication from the archives, and cannot but dim his lasting fame.

THE REVIEWER'S RESPONSIBILITY.

The assertion, freely made in France, that criticism is creative literature, seems all the more audacious inasmuch as, in that country, criticism and current book-reviewing are very much one and the same thing. This seeming paradox is the result of literary traditions which are almost exclusively French. What these conditions are is charmingly illustrated in a recent anecdote of Sully-Prudhomme of the French Academy, recipient of the Nobel prize for literature.

In the spring of 1865 young Sully-Prudhomme had published, with the aid of a friend, his first volume, 'Stances et Poèmes.' The problem with his fellows of the schools who recognized in Sully a rising genius, was how to get the great Sainte-Beuve to give at least a paragraph in his "Nouveaux Lundis" to the youthful poet. Accordingly the young Gaston Paris—since renowned as philologer, critic, academician, and director of the Collège de France, then merely a philologer of considerable promise—who had the advantage of Sainte-Beuve's acquaintance, called at the great critic's apartment and left, with a discreet note, his friend's volume of verse. Every Monday the poet's circle of admirers turned eagerly to Sainte-Beuve's column in the *Constitutionnel.* The laggard critic wrote about everything else—on the old poets, on astronomical fantasies by Flammarion, worst of all, upon modern poets other than Sully. As the months went by, the indignation of these young people knew no bounds. It was seriously proposed to march *en masse* to the great critic's door, and *conspuer* him for his lack, not only of critical insight, but of common civility. Fortunately, wiser counsels prevailed, and the *censor literarum* of that day was spared such a serenade as the present *censor morum,* Senator Bérenger, has several times undergone at the hands of his student protégés. The review, a very favorable one, appeared before Sully's friends had thought out a parliamentary method of applying *force majeure* to the

indolent author of the "Nouveaux Lundis."

The incident shows strikingly just what a literary review is in France. It is essentially an act of courtesy from a man of letters to a colleague. The reviewer, whose work is always signed, is responsible primarily to the brother-author whom he criticises, and after that to the craft of letters. Only very remotely is he answerable to the editor whom he serves, or to the general reading public. The result is that, with a free hand as to space and as to manner —except as far as considerations of professional courtesy may restrain him—the French reviewer is expected to give his work an absolutely personal flavor; and this means—in a country where are found writers with the engaging temperament of Anatole France and Jules Lemaître, with the doctrinaire tenacity of Brunetière and Doumic, with the scholarly clarity of view and sensitive appreciation of Gaston Paris and Gaston Boissier—that book-reviewing and literature may be as nearly one as they were when Sainte-Beuve was writing his "Causeries de Lundi."

There can be no doubt whatever that there is in France ten times as much readable reviewing as there is in England or America, while the skilled reviewer attains a popularity and prestige the like of which can be instanced in England only in the palmy days of the *Edinburgh Review* and the *Quarterly*. This is undoubtedly the reader's gain. Whether the great body of writers come off so well under this dispensation is open to question. To be benevolently reviewed by an elder brother of the craft is a rare good fortune for a young writer, and the most casual commendation from Jules Lemaître or Anatole France is worth more than the anonymous plaudits of the united press in England or America. But what of the great host of neglected authors in France? The dozen great critics who hold the fates of books in their hands review only what they will. Some of the critical journals in this country contrive to notice, in one way or another, practically every book which is submitted to their inspection. No French review of a popular kind so much as makes the attempt to keep up with the publishers' presses. Thus the great mass of books is relegated to oblivion, or, at best, to an obscure struggle for existence. Even the publishers advertise very parsimoniously, and, in the country which leads the world in the production of meritorious works in belles-lettres, the press gives a very minimum of attention to the producers of this class of literature. To be shorn of notoriety is their melancholy lot.

Since the machinery for puffing up an ephemeral reputation is much less highly developed in France than in the English-speaking countries, the French reader is spared the flood of perfunctory and even ignorant reviews which besets the English and American public. On the other hand, it is a question if the French do not unduly submit their literary judgment to the charming and sometimes capricious personality of their great critics. In many ways the comparatively impersonal method of the anonymous reviewer is fairer, both to the public and to the author, while critical journals which have represented consistently a fixed attitude towards literature attain an authority and influence that no individual critic can ever enjoy.

If America ever adopts the French mode of personal and eclectic reviewing, it will be less because it is converted to a new theory than because it is compelled by relentless conditions. Already it is impossible to notice, even if it were worth while, anything like the total product of the publishers. We admire the diligence of those journals which undertake to review all the books that pass through their offices, and marvel at the fortitude of the public which reads this mass of book notices; but the *Nation* is unable either to imitate the thoroughness of its contemporaries in this respect, or to strain in like manner the indulgence of its readers. Some two thousand books are sent to us every year by the publishers. All of these are promptly acknowledged in "Books of the Week." About one-half, and the majority of these in very brief form, are reviewed. If we always consulted our own inclination, or primarily the pleasure of our reviewers, the list might be still smaller. It would be very easy to fall back upon the French principle that the reviewer is bound only by the comity of the craft; but we feel that it is a healthful tradition that his responsibility is primarily to the public, which expects of him correct information and sound judgment, and hence that the reviewer, in his choice of books, must be guided by some broader principle than personal preference for the book, personal liking for the writer, or even natural benevolence for the beginner.

MODERN LANGUAGE ASSOCIATION AND AMERICAN DIALECT SOCIETY.

CAMBRIDGE, January 1, 1902.

The Modern Language Association, which met in Cambridge on Thursday, December 26, for a three-days' session, has reached its feminine if not its masculine majority. Founded in 1883 at a meeting in New York city, it has just celebrated its eighteenth birthday. The Association began with something over a hundred members, recruited during the first year of its life. It has now more than six hundred, not counting the two-score scholars from different parts of Europe who have accepted honorary membership with it. Its first volume of publications covered the first two years of its existence. It now prints each year, in regular quarterly instalments, a volume of some six hundred pages. It has outgrown a single meeting, and each year the Central Division convenes at the same time as the parent association in some place nearer the homes of members in the Central West. What has been done for the advancement of knowledge in this time? The tale is best told by the sixteen completed volumes which bear the Association's name. From the first these have been increasingly valuable, until now they contain many of the most important contributions to the modern literatures printed in any language. It is not strange that the members of this vigorous and growing body should feel some elation, some reason for congratulation over the past and hopefulness for the future.

There is also cause for congratulation in the meeting just closed, which has been one of the most successful in the history of the organization. From the opening session, when the Association was welcomed by the felicitous words of President Eliot, until Saturday noon, when the members gathered at the farewell lunch in University Hall, there was intense interest and no little enthusiasm. Not only did no unfortunate incident mar the meeting in any way, but the sessions were attended by more than the usual number of attentive listeners to the papers read and discussed. It was felt that every part of the programme had something not to be lightly missed. This does not mean that all did not also enjoy the social part of the convention, the notably pleasant reception by President and Mrs. Eliot, the charming talk on "The College Professor and the Public" by Mr. Bliss Perry of the *Atlantic Monthly*, and the numerous less important occasions for friendly greetings with others working in similar fields, or equally agreeable discussions of many problems connected with the routine work and investigation. All these were a by no means insignificant part of this educational gathering.

It is true that this convention differed in one respect from those of recent years. Such a gathering is always in one sense a small one. Only about one-fifth of the members of the Association ever attend, though nearly as many more are usually in session with the Central Division, as this year at the University of Illinois. But besides, owing to the extreme distance from the centre of the country, the representation was this year mainly from New England and the adjacent parts of New York State. A fringe of other States was represented by one or two members each, the largest number from Pennsylvania and Michigan, two from Ohio, and one each from Indiana and Wisconsin. The South, including Maryland and Kentucky, was fairly represented by ten members. If, however, the representation of New England was disproportionately large in number of members present, the Northern States west of New England more than contributed their share of papers to be read, or "read by title"—that is, presented for publication. To the programme the New England men contributed thirteen papers—or fourteen, if the report of the Pedagogical Section be counted. The Northern States west of New England were represented by an equal number, fourteen, if one from west of the Mississippi is included, as indeed it should be. The South had naturally the smallest representation; only two papers coming from that section.

In point of subject the distribution of papers is always a matter of comment. It had

been apparent for some time that those on English language and literature were considerably more numerous than those on any of the other modern languages forming a part of the Association. This is, of course, not only natural but right, and would be equally true of the mother tongue in any convention of scholars in any nation. This year, therefore, it is not strange that there should have been fourteen papers by professors and instructors in English to eight by those teaching German and seven by those teaching French and the other Romance languages. In English the papers were particularly well distributed over the whole field of our literature. Two treated subjects in Old English, three Middle English, four the modern literature, and five were of general scope, though naturally related in an indirect way to the modern period.

Beyond this it is not easy, in an untechnical account, to give an adequate idea of all parts of the programme. To say that Professor Cook of Yale proved the runic inscriptions on the Ruthwell cross to be later than usually supposed, and certainly considerably later than the Northumbrian poet Cynewulf; or that Dr. Schofield of Harvard gave a new and exceedingly important account of the home of the King Horn story, will convey but a slight idea of the importance which scholars attach to such close investigations. Such papers deal with a single point, or a very few points, but at their best settle these once for all, doing away for ever with much obscurity or useless discussion, and sometimes throwing a flood of light on kindred subjects. Nor is this a slight advantage. When they have been read and published, they become the property of every teacher who keeps up with his subject, and displace, in one little corner of knowledge, an obscure or imperfect or false statement with exactness and truth. They delight those who abhor misstatement even when not directly affecting character and life. But, besides such technical papers, there are, at every convention of the Association, a goodly number of more general nature, which would interest any intelligent hearer.

We may well begin with the address of Professor Sheldon, President of the Association, though this was not given until Thursday evening, the second session. Professor Sheldon spoke in his characteristically cautious way of "Practical Philology." emphasizing the linguist's relation to grammar and dictionary, and cautioning even him against neglecting the dictates of custom, which establishes somewhat different standards from those to be expected in a natural development of language. The philologist recognizes evolution of linguistic forms; he must still acknowledge, as must every educated person, the claims of fashion. Professor Sheldon also expressed a wish for a broader recognition in our dictionaries of both natural and acquired forms of the spoken language, and deplored in the strongest terms any conflict between the philologist and his sometime antagonist the literary critic—a sentiment which received the hearty approbation of his audience. One paper also in the session of Thursday afternoon not only was of general character, but brought out some profitable discussion. This was the report of the Pedagogical Section by its Secretary, Professor Mead of Wesleyan, on the value of rhetorical teaching through much practice in writing and individual correction—a practice now so general in the leading colleges and universities. The subject was suggested by an opposing view in the *Century* a year or so ago, the writer of which advocated a study of English literature without theme-writing as equally effective —a most remarkable position. It is not surprising that the paper read by Professor Mead, and made up from the opinions of various instructors over the country, showed a large majority decidedly in favor of the present plan, in spite of the vast amount of labor and expense involved. The one other paper of the afternoon which could not but interest every American was that of Dr. Walz of Harvard, on three Swabian journalists and the American Revolution. This presented in an entertaining fashion a careful investigation of the interest in the Revolution on the part of German writers, among them the poet Schiller.

Friday morning's session was introduced by an excellent paper on the influence of Montaigne upon Shakspere, by Miss Hooker of Vassar College. This influence, while before recognized, was exhaustively treated by the writer, who proved conclusively that one other must be added to the number of writers who have found the great French essayist a mine of philosophic truth and epigrammatic statement. But the paper which afforded the most entertainment and brought out the greatest amount of discussion in the whole convention, was that of Professor Thomas of Columbia on the amelioration of our spelling. Professor Thomas is not a "fonetic," much less a fanatic, reformer. From the paper read he certainly deserves to be characterized as a wit, with mind and heart upon the right side. He brought forward no radical scheme for accomplishing the much desired result; he posed as no self-satisfied leader in a great movement; but, with many a witty sally at the expense of extremists on both sides, and a quite inimitable manner which disarmed criticism from the start, he presented the anomalies and absurdities of our present cacographic mode, and added one very practical suggestion toward "amelioration." This was the education of our common-school teachers in the history of our spelling, the manner in which the astounding and absurd anomalies grew up, and the senselessness of preserving what has long become outgrown and useless. Such a plan would bring more quickly than anything else, he thought, a realization of the unnecessary burden upon young and old of what we call, with unperceived sarcasm, our "orthography," and hasten the time when even the school-boy would assist in rebelling against the illiteracy in form of a great civilized language. Professor Thomas also called attention to a fact which should be more carefully regarded. Our American copyright law, requiring books to be put in type in this country in order to obtain copyright, is really responsible for a deal of British instead of American spelling, where the latter is simpler. On the other hand, perhaps the chaos which this is bringing, in a small way, may assist in making evident the burden, and eventually in throwing it off.

The papers of Friday afternoon were excellent (not to deny the same characterization to those of other sessions). That of Dr. Schofield has been alluded to already. Mr. Hoyt of the Harvard Graduate School spoke on the legends of Horn and Beves, a study of the relationship existing between these two metrical romances of Middle English. The one other paper which deserves special notice was that of Professor Wood of Johns Hopkins on "Literary Adaptations in Gerhart Hauptmann's *Versunkene Glocke*." At this session, also, the Association was again entertained by a paper, presented by Professor Scott of Michigan, on a "List of Hated Words." Professor Scott gave many amusing examples of words which had excited the antipathy of various persons, and some of the amusing reasons assigned for their dislike. The paper was a study in the psychology of language, to which, it may be said, a philological analysis would have lent some helpful suggestions. In the last session of the Association two papers were of sufficiently general interest to be briefly mentioned. One was by Professor Hulme of Western Reserve University on the influence of Chaucer upon Milton, which, the writer thought, had not been sufficiently recognized by critics. The other was by Professor Baldwin of Yale, who showed that the influence of Sterne's works upon French literature had been much underestimated.

The American Dialect Society met as usual under the friendly patronage of its elder sister, with which it has in many respects a common interest. Partly on this account, the Society makes little of its annual meeting, so far as programme is concerned. Its publication, *Dialect Notes*, is carried on without previous presentation of papers at an annual conference. The short session on Saturday morning was occupied wholly with brief reports of the financial and other status of the Society, and the election of officers for the ensuing year. With such a modest gathering, each year, always at the time and place of the Modern Language Association, the Dialect Society quietly carries on its investigations, and publishes its results as often as may be. This year, it is true, the Society was allowed for the first time a paper on the general programme—a desirable way of calling more public attention to its labors. As was appropriate, too, for a first year under this new arrangement, the paper, by Professor Emerson, the Secretary, was of more general character, explaining the aims and methods of the Society, answering criticisms that have been made, and urging the importance of the work from every standpoint. Professor Emerson called attention to the somewhat different character of dialect work in Germany and England, and the wisdom of following both models in our American field. He emphasized especially the need of local glossaries, to be based first of all upon the collections of Americanisms and other dialectal words already in print, and supplemented by such new words as may be locally gathered. There should be one or more of these for each State, after which there would be some prospect of combining them all in a dialect dictionary for the whole country. The reports at the annual meeting showed the Society in as prosperous condition as at any time in the past; but more members are needed, and more active workers, in order to accomplish all that is desired.

N. M.

LORD ROSEBERY.

OXFORD, December 20, 1901.

Lord Rosebery has performed one remarkable achievement: he has made himself for the moment the interesting man of English politics. We have all of us been talking, during last week, of what he was going to say at Chesterfield; we are all of us talking this week of what he has said. We are all of us wondering what is the real meaning of his speech, and some of us are wondering whether it means anything at all. The readers, then, of the *Nation* may possibly like to know some of the different views which, to judge from what one reads and hears, are at the present moment taken in England of Lord Rosebery's character and position.

Consider first the opinion formed of his Lordship by his many friends and admirers. He is, according to their view, the coming man. His ability is undoubted. He has been a successful Foreign Secretary. His tenure of the Premiership, it is true, was not marked by any kind of triumph, but his failure was due partly, it may be, to the disloyalty of colleagues, and certainly to the unkindness of fortune, which had placed him in a false position where no cleverness could avert absolutely certain defeat. And even after the rout of the Gladstonian Liberals, his Lordship, it will be said, remained the most remarkable of the Liberal leaders. His resignation of leadership has placed him in a situation absolutely unlike that occupied by any other politician. He stands before the country as a man who has risen above and is independent of party, and is prepared to be rather the servant of the nation than the leader of a faction.

This claim (they continue) he has made good by his recent speech, for he has spoken with a distinctness and plainness unknown to the chief men of the Opposition or to leading Ministers. He has uttered words suited, to use his own expression, for the Palace of Truth. The best evidence of the orator's sagacity and honesty is, that men of all parties find in his speech something to praise, and also something with which they individually do not agree. He has avoided at once the cant of pharisaic Liberalism and the cant of official optimism. He has summed up in the best words the best thoughts of us all, and, while he has pointed out the grave errors committed by the Opposition, he has also denounced the terrible shortcomings of the Government. He has warned the partisans who call themselves Liberals that they are many of them in character Tories, who cling to obsolete shibboleths at variance with the facts and the requirements of the times; he has told the Ministers who boast of their Imperialism that their blunders threaten the existence of the Empire, and that their incompetence may lose England South Africa, just as the dulness and the obstinacy of George the Third and Lord North lost England the Thirteen Colonies. He has shown himself the leader for whom we are all in search, who can rise above party and guide the country through the perils of a serious crisis. Lord Rosebery, in short, in the eyes of admirers who are ready to be his followers, if only he will consent to be their chief, is the statesman who can at the same time renovate the Liberal party and bring England triumphantly through the present war; and, to judge from Lord Rosebery's attitude and speeches, he himself shares the hopes of his admirers, and expects to prove the heaven-sent pilot destined to weather the storm.

Take next the judgment which may be passed on Lord Rosebery by less partial critics. To such candid friends—and his Lordship has few foes—his ability and his bona-fide desire to play a patriotic part may seem past dispute; but when this admission is made, his claim to become the leader of the nation may well be open to grave question. He has not, it will be said, given proof of any extraordinary capacity; his career as a Premier was marked by failure. The admitted difficulties of his position, though it was one to a certain extent of his own choosing, may indeed be an excuse for want of success; but the mere fact that a statesman has, on the one occasion when his powers were put to the test, shown himself unable to cope with the demands of a political crisis, is not of itself a reason for intrusting him at a most critical moment with the fortunes of the state; nor is it possible in 1901 to forget entirely the transactions of 1893 and 1894.

Lord Rosebery, indeed, according to the construction most generally put upon his speech, wishes now to have done with home rule. Unfortunately, the question will suggest itself, Why did his Lordship ever become a Home-Ruler? Admit, as fairness requires, that he was never very zealous for home rule; still, when he became the follower and later the successor of Mr. Gladstone, he must have believed that the policy of home rule was recommended by the dictates of political expediency. What ground, then, it may be urged, has any Unionist for trusting in the soundness of his Lordship's judgment? The question is the more serious because parts of the speech delivered at Chesterfield suggest a fear that Lord Rosebery is in 1901 misjudging the intentions of the Boers very much as he must in 1893 have misjudged the policy of the Irish Nationalists. He assumes that the Boers, in spite of the conduct and the language of their leaders, are not really fighting for independence, and are willing to seek terms of peace. This assumption bears a close resemblance to the credulity of Gladstonians who, with the evidence collected by the Parnell Commission before their eyes, persisted in the belief that the Nationalist leaders were at bottom loyal to the United Kingdom, or would certainly become so from the moment that the establishment of an Irish Parliament and an Irish Government should make it possible to impede the action both at home and abroad of the Imperial Government.

Let this, however, pass. Assume that in politics you must allow the existence of some sort of statute of limitations, and that the mere lapse of seven years is sufficient of itself to free a politician from liability for bygone errors of judgment. Even if this enormous concession be made, it is still (it will be said) very difficult to accept Lord Rosebery at the value put upon him by his adherents. The policy expounded in his long and able speech hardly differs essentially from the policy actually pursued by Lord Salisbury and his colleagues. In common with every Unionist, Lord Rosebery manfully maintains the justice and the expediency of the war; he repudiates all the charges of barbarism and cruelty brought against generals or soldiers; he trusts to the generalship of Lord Kitchener; he has no wish to recall Lord Milner; he maintains that the duty and necessity of the moment is to carry the war at all costs to a successful issue, and clearly believes that the annexation of the African republics to the British Empire is an irreversible act, commanded by considerations of necessity and justice. He, it is true, criticises with force many of the acts and words of the Government. So, too, do many Unionists. No human being either outside or, for that matter, inside the Cabinet can deny the commission of grave errors; but then common sense suggests the reflection, to which Lord Rosebery apparently gives little weight, that retrospective criticism is, even when sound and effective, no guarantee that the critic will, on the occurrence of a sudden crisis, show more wisdom or foresight than has been exhibited by the working statesmen whose errors it is so easy to deride. Even if it be admitted, as many will be glad to concede, that Lord Rosebery's urbanity and knowledge of the world might have saved him from some of the minor mistakes of language or of taste committed by particular Ministers, it is difficult to see any proof that he would, on the whole, have conducted the affairs of the nation with greater and more rapid success than the men at present in office.

The real cause, however, it will be said, for hesitating to accept Lord Rosebery as the leader who can rise above party and become the embodiment of the national will, lies, after all, far deeper than any doubts suggested either by the events of his past career or by the nature of his practical suggestions for the termination of the war. It is not clear that he possesses the instinct of leadership. All the men who from time to time have led the people of England have had but one characteristic in common. They have all been endowed with boldness and decision; they have all been men of strong and some of them men of iron wills. Can as much, it will be asked, be said of Lord Rosebery? The answer must appear to candid friends or hostile critics to be at best doubtful. A study of his career rather suggests that he is by nature the skilful and intelligent man of letters who, just because he stands a little outside the labors and the turmoil which occupy and harass responsible politicians, sees at moments a little further than do statesmen engaged in the wearying work of government and administration. But the habit of easy meditation detached from the responsibility of laborious action is not generally found favorable to strength of will. Literary talent is undoubtedly closely allied with one characteristic: the man of letters is almost always able and inclined to study his own attitude. Lord Rosebery may seem to critical observers an actor who first poses before himself with perfect honesty as the true patriot, and then, by the dignity of the attitude which has become natural to him, impresses the public with his own belief in his sagacity and his patriotism.

My aim has been to describe two different views of Lord Rosebery, each of which is at this moment, I believe, taken by many Englishmen. Which, if either, is the true

view of his character, is a matter for the future to decide. AN OBSERVER.

THE GRANDE MADEMOISELLE.—I.

PARIS, December 19, 1901.

The memoirs of the Grande Mademoiselle, daughter of Gaston d'Orléans and a niece of Louis XIII., are in every historical library. They are a very valuable document on a highly interesting period—all the more, perhaps, as they are very artless and devoid of all literary pretensions. Madame Arvède Barine has used them largely in writing 'La Jeunesse de la Grande Mademoiselle (1627-1652).' It is very readable, and has all the merit of her former works, already very numerous. Among them I will cite only 'Portraits of Women [Mrs. Carlyle, George Eliot],' 'Princesses and Great Ladies [Marie Mancini, Queen Christine, the Duchess du Maine, the Margrave de Bayreuth].' If I had to criticise these historical studies, I should say that the author does not enter enough into the spirit and atmosphere of old times; she cannot help being very subjective, and she interjects here and there words and remarks which savor too much not only of the present time, but even of Parisian life. There is at times in the expression of her thoughts what I should almost call a journalistic turn, which produces on the reader the effect of a dissonance in a succession of grave musical sounds.

The "Grande Mademoiselle" is certainly one of the most original figures of her time. "One cannot say," writes Arvède Barine, "that she figured in the foreground. Hers was a rather small genius . . . But this adventurous and picturesque woman was eminently one of those personages whom Emerson called representative. The spectacle of her agitated existence is a marvellous commentary on the profound transformation which occurred, towards the midst of the seventeenth century, in the sentiments of France." This transformation coincided with the civil wars and the troubles of the Fronde; and the Grande Mademoiselle was one of the actors in the Fronde. "In the first part of her life, none of the great ladies of the Fronde was more than she a heroine of Corneille, none had a more boundless desire for greatness, a more superb contempt of low passions—and among these Mademoiselle placed love." Generalizations are always dangerous: Arvède Barine would have it that the Grande Mademoiselle's early career is typical of the Cornelian spirit, while in the latter part of her life she represents the Racinian type. *Pauline* of "Polyeucte" and *Phèdre* of Racine's tragedy are two representatives of the passion of love, who, in Mme. Barine's mind, show the transformation that took place in the French mind and French manners from the time of Louis XIII. to the time of Louis XIV.

The Grande Mademoiselle, Duchess de Montpensier, was the daughter of Gaston d'Orléans and of a distant cousin of the royal family, Marie de Bourbon, Duchess de Montpensier. It is difficult to be too hard on Gaston d'Orléans; his portrait by Arvède Barine is only too exact. I will cite it, chiefly in order to show this author's *manière:*

"Her father," she says, "resembled our decadents. His nerves were out of order, his will abolished, yet he dreamed of accomplishing rare and singular deeds. . . . He was, *en chair et en os*, in the seventeenth century, the Prince whom our modern writers believe they have invented, and whom they like to introduce on the stage or in their novels; the living anachronism who has inherited the traditions of rugged ancestors, but who can place at their service only an enervated and unbalanced character."

At the age of eighteen, Gaston d'Orléans possessed the duchies of Orléans, of Chartres, the county of Blois, and a revenue of a million of livres. His wife was the richest heiress in the kingdom. She brought in dower the sovereignty of Dombes; the principality of La Roche-sur-Yon; the Duchies of Montpensier, Châtellerault, and St. Fargeau; a number of estates. Mademoiselle was born at the Louvre on the 29th of March, 1627; her mother died the seventh day after her birth. The child was educated at the Tuileries, which had not yet the dimensions they afterward acquired, and were then, so to speak, in the country.

She had a royal establishment, an army of servants and attendants. Her governess was a Madame de Saint-Georges, who knew the court well. She confessed afterwards that she was very badly educated; people spoke to her only of her high rank and of her great wealth. Madame de Saint-Georges was old-fashioned, and not one of those whom Molière afterwards described in the "Femmes Savantes." She believed that the greatest Princess in France knew enough if she knew how to read and write. The Memoirs of Mademoiselle show us the court of Louis XIII. and the great events of the time as they might be viewed by the most ignorant child. Cardinal Richelieu appeared to her a sort of monster, always ready to interfere with the amusements of the court. Speaking of the time when her father had left France, had become a rebel, and had remarried secretly with a sister of the Duke of Lorraine, she says:

"A great many things happened at that time. I was a child. I took part in nothing and could remark nothing. All I remember is a ceremony in which the Duke d'Elbeuf and the Marquis de la Vieuville were degraded from their orders. I saw their arms taken from the rank of the others; I asked the reason. I was told that this injury was done to them because they had followed Monsieur. I immediately began to weep."

When Mademoiselle came of age, the choice of a husband became the great preoccupation of her life. Would her husband be a King, or merely a Royal Highness? The first candidate, who amused her only for a moment, was the Count de Soissons, who was commonly called Monsieur le Comte, a cousin of hers, a brilliant soldier, but a very ordinary man, who had followed the cause of Monsieur in his second rebellion. M. Le Comte was killed at the battle of La Marfée, and Mademoiselle understood, so she says simply, that "they were not made for each other." Mademoiselle cast eyes on the Cardinal-Infanta, Ferdinand, the third son of Philip III., who commanded in Flanders the army of the King of Spain. He was Archbishop of Toledo, but he had not been ordained as a priest, and he might take a wife. The Cardinal-Infanta died on the 9th of November, 1641, after a very short illness. We read in the memoirs that the Spaniards were accused of having poisoned him, "for fear lest he should make himself master of Flanders by an alliance with France."

Soon afterwards the famous conspiracy of Saint-Mars opened the eyes of Mademoiselle to her own father's character. "Monsieur," says Arvède Barine, "surpassed himself in this crisis. He trembled and cried, he lied and denounced, with so much abjectness that the noise of his shame filled France and penetrated the Tuileries, where it threw Mademoiselle in despair. Her father deranged her theological ideas regarding Princes of the blood. How could a being who partook of divinity be so utterly contemptible?" When the Queen Henrietta of England, daughter of Henri IV. and wife of Charles I., took refuge in France, she thought of marrying her son to Mademoiselle; but the Prince of Wales was then very timid. He was younger by three years than Mademoiselle, and made a very unpleasant impression on her by his awkwardness. She tells us that at a representation of "Orphée" at the Palais-Royal, where she sat on a throne, magnificently dressed, with the Prince of Wales at her feet, she took pity on him. "My heart as well as my eyes looked down upon him; I had it in my mind to marry the Emperor."

She was for a time possessed with the idea of becoming Empress; so much so that when Ferdinand III. took a wife, she said: "The Empress is *enceinte* and will die in her confinement." Curiously enough, she did die, and Mademoiselle's hopes were revived.

"The desire to be Empress," she says, "which followed me everywhere, and which always seemed to me to be near fruition, made me think it would be well to cultivate beforehand habits which might be in conformity with the Emperor's humor. I had heard that he was devout, and, following his example, I became so devout myself that, after having feigned some time to be so, I experienced for a week the desire to make myself a nun at the Carmelites, but I confided this to nobody. I was so occupied with it that I could neither eat nor sleep. . . . I can say that during that week the Empire was nothing to me. I was not without some vanity in the idea of leaving the world at such a conjuncture."

This is certainly a most extraordinary confession, and we must agree with Arvède Barine when she says: "Having begun for political reasons to make the gestures and take the attitudes of devotion, she fell into her own trap and deceived herself to the point of wishing to enter a convent. There is no more curious example of the power of auto-suggestion."

After a short time, Mademoiselle's religious crisis was over, and she threw herself into politics, like so many great ladies of the time. "We have three ladies," wrote Mazarin to Don Louis de Haro, "who would be capable of governing three great kingdoms or of turning them topsy-turvy: the Duchess of Longueville, the Princess Palatine, the Duchess of Chevreuse." Her adventures are a part of the history of France. The daughter of Gaston d'Orléans had grown up in the belief that the Orléans branch of the royal family might reach the throne. From Charles VIII. to Louis XIII. the crown had been transmitted only three times from father to son. Before the birth of Louis XIV. Gaston thought himself almost on the throne. At the age of nine Louis XIV. was very ill, and it was thought for a moment that he would die.

Louis XIII. was in very delicate health. Besides the Orléans branch, there was a third, the branch of Condé, which was a little further from the throne, but the members of which were remarkable for their brilliant qualities. It is, therefore, not surprising that Mademoiselle prepared herself for the most exalted career. Her vanity was boundless; her ambition vague, but all the more ardent.

Correspondence.

VERBAL PREJUDICES.

To the Editor of The Nation:

Sir: An *obiter dictum* in a paper which I read before the Modern Language Association last week has since appeared in a number of newspapers in a curiously distorted version. The following is a sample:

"A professor of the University of Michigan, being desirous of ascertaining the most hated word in connection with spelling-reform investigation, wrote to a thousand persons for their opinion, and was surprised when the majority replied that the most hated word was 'woman.' "

What I actually said was as follows:

"A considerable number of persons hate the plural form *women*, as being weak and whimpering, though the singular, *woman*, connotes for the same persons ideas of strength and nobility. It is for this reason, perhaps, that *woman's building, woman's college*, and the like have supplanted in popular speech the forms *women's building, women's college*, etc. It is noteworthy, also, that, in the titles of women's magazines and the names of women's clubs, the singular in most instances has been chosen instead of the more logical plural."

It will be noticed that *women* was not the best-hated word on my list. That bad eminence was reserved for *victuals*.

I take the opportunity to say that any one who has violent antipathies to particular words or phrases, not traceable to the meaning, will do me a favor by corresponding with me. All that I wish is (1) a list of such *verba non grata*, with (2) reasons for the dislikes, where reasons can be given.

Fred Newton Scott.

University of Michigan, December 30, 1901.

Notes.

We can make but a comparatively meagre selection from Macmillan Co.'s very numerous spring announcements: 'Napoleon Bonaparte,' by Thomas E. Watson, and yet another biography by J. H. Rose; the Life of Sir George Grove, by C. L. Graves; the third and last volume of Mrs. Hamilton's translation of Gregorovius's 'History of the City of Rome in the Middle Ages'; the second volume of Prof. William Ridgeway's 'Early Age of Greece'; 'A Short History of Germany,' by Ernest F. Henderson; 'The Story of the Mormons,' by William A. Linn; 'Source Readers of American History,' by Prof. A. B. Hart; John Richard Green's 'Oxford Studies'; 'History: Suggestions as to its Study and Teaching,' by Prof. Lucy Maynard Salmon, from whom we are to have also 'A History of the Appointing Power'; 'The Mastery of the Pacific,' by A. R. Colquhoun; 'The Island of Formosa: A Complete Account of its Condition, Political and Industrial,' by James W. Davidson, United States Consul; 'The Principles of Western Civilization,' by Benjamin Kidd; 'A History of Political Theories, Ancient and Mediæval,' by Prof. William A. Dunning; 'Democracy and Social Ethics,' by Jane Addams; a translation by Frederick Clarke of Ostrogorski's 'Democracy and the Organization of Political Parties'; 'The Genesis of Modern Constitutions,' by Prof. James Harvey Robinson; 'The Development of Cabinet Government in England,' by Mary Taylor Blauvelt; 'The Theory of Prosperity,' by Prof. Simon Patten; 'The Ivory Workers of the Middle Ages,' by A. M. Cust; 'Lessons from Greek Pottery,' by John H. Huddilston; 'The Chatsworth Van Dyck Sketch-Book,' with letterpress by Lionel Cust; 'The Diamond Mines of South Africa: Some Account of their Rise and Development,' by Gardner F. Williams; 'A Lexicon to the Poetical Works of John Milton,' by Laura A. Lockwood; 'What Is Shakspere?—An Introduction to the Great Plays,' by Prof. L. A. Sherman; 'Shakspere in Tale and Verse,' by Lois G. Hufford; and 'The English Chronicle-Play: A Study in the Popular Literature concerning Shakspere,' by Prof. Felix E. Schelling.

L. C. Page & Co., Boston, will issue directly 'The Cloistering of Ursula,' a romance by Clinton Scollard.

In Prof. George R. Carpenter's brief life of Longfellow (Boston: Small, Maynard & Co.) the excellent series of "Beacon Biographies" is prosperously continued. Considering the present widespread reaction against Longfellow's old-time vogue, Professor Carpenter's task was not of the easiest; but he has performed it in a fashion at once workmanlike and sympathetic. The account of events in the poet's life is clear and consistent, and sufficiently enlivened by local color. Indeed, with the full records edited by Mr. Samuel Longfellow, this part of the work was doubtless comparatively easy. The narrative of less external happenings in the development of Longfellow's mind and art is fairly intimate and no less clear. The final criticism of Longfellow's poetry is discriminating and just, yet rather unusually appreciative of his real merits. In short, the little book exhibits, in the phrase of the prospectus of the series, "the best contemporary point of view." Its chief virtues are clarity and good sense.

Mr. Strutt's 'Fra Filippo Lippi' (London: George Bell & Sons; New York: Macmillan) is one of those compilations for which there seems a great demand, and the production of which at a moment's notice has been made easy. The receipt is so much Morelli, so much more of certain of his followers, a pinch of Cavalcaselle, sprinkled over with references to authorities (chiefly such Germans as have been of small use to the writer), full of nice plums in the form of illustration, and salted with caustic remarks against the laborious students who really "fished the murex up." There is not an idea, nor even a fact, in Mr. Strutt's book due to Mr. Strutt. Yet we can, for that reason, perhaps, sincerely recommend it. All that the person of culture need know about Fra Filippo he will find in this book. There are a good number of errors due to unfitness and haste, but they are not vital.

'Bright Days in Merrie England,' by A. Vandoren Honeyman (Plainfield, N. J.; Honeyman & Co.), is a pleasantly, though most naïvely written record of four-in-hand journeys in England. It is no more than a guide-book to famous roads and inns and show-places in several counties, but its numerous illustrations, from photographs, give it a certain interest for those who care for rural England, and the tourist may find his profit in the writer's sprightly comments on the comforts and discomforts that attend coaching. Oxford was the main starting-point of these excursions, but there are also chapters on the Isle of Wight and the English lakes. The literary gossip is sometimes amusing, as when, in comment on a picture of Marie Corelli's house in Stratford-on-Avon, we are told that "her splendid literary work has conferred additional honor upon this already world-famous town." The naïve enthusiasm and uncavilling enjoyment that pervade the book are as rare as pleasing.

The quaint volume by Jane De Forest Shelton, entitled 'The Salt-Box House: Eighteenth Century Life in a New England Hill Town' (Baker & Taylor Co.), takes its name from the local designation of the house built and occupied for five generations by the family whose history is herein given. Heredity, social position, and means were more favorable to this family than environment, which, from their isolation in a remote corner of Connecticut, made them less conspicuous in public affairs than many of inferior standing. On the other hand, we have an exceedingly pleasant picture of a comparatively rare phase of New England colonial life—that of a well-to-do family of the Church of England, with slaves and ample household appointments, somewhat after the pattern of English country gentry, yet with a distinct American flavor. We accompany it from one generation to another with all their widening interests and varying affiliations. The book is remarkable for the minuteness and accuracy with which every detail of domestic life is depicted. As is truly remarked in the preface: "There is not recorded a custom or a costume, an article of use or adornment, a habit of life or of manner, for which there is not authority for the period and locality designated." The gradual decay, through removal and thinning out, of the family life exemplifies the process by which so many homes in rural New England districts have been desolated. The final occupant of "the Salt-Box House," while of the ancient-maiden type indigenous to New England, was as unique and characteristic as the house she represented. The illustrations of this work are interesting and effective.

In 'The Wild Fowlers,' by Charles Bradford (Putnams), we have duck-shooting treated in colloquial fashion. The opening chapter, "Point-Shooting for Black Duck," suggests Mr. Barlow and his two famous pupils, Sandford and Merton. In the present instance that eminently good man and the two youths are represented by Dr. B——, and one "Peritus," a young companion. An attendant, in the person of a professional gunner (who speaks the dialect which one never encounters outside of works of fiction), is used to set decoys and as a foil to emphasize the correct language of his employer and his young friend. The copious conversation of Dr. B.—— and "Peritus" serves as a medium to impart information in regard to "shot-guns, ammunition, the natural history of wild-fowl, and

the chivalric sportsman's best method of taking the game." The remaining chapters are devoted to "battery-shooting," and are equally marked by garrulity. If there be one reason for printing this little volume, it may be found in the reproduction of two very beautiful drawings of wild fowl, by Mr. A. Thorburn.

The 'Handbook to the Textual Criticism of the New Testament,' by Frederic G. Kenyon, Assistant Keeper of Manuscripts, British Museum (Macmillan), while not a rival of "the standard works of Gregory and Scrivener," contains matter more recently available. On the palæographical side it is thorough and accurate, as the author's position would lead one to expect. The critical position is substantially that of Hort, but Mr. Kenyon wisely declines to accept the paramount authority of the Codex Vaticanus. To the four forms of the text named by Westcott and Hort: Syrian, Neutral, Alexandrian, and Western, he applies the first four letters of the Greek Alphabet. The more recent theories of Blass, while fairly stated, are regarded as not proven. The sixteen facsimiles in the volume are interesting, but in some of them the size of the letters has been so reduced that it is difficult to read the text.

The third volume of Dr. W. H. Allchin's collaborative 'Manual of Medicine' (Macmillan) deals with diseases of the nervous system, of which it gives a review in about four hundred closely printed pages. There are nine contributors to the volume, but, in spite of this, the text runs on smoothly and without obvious changes of style. The section on anatomy, written by the able hand of Prof. C. S. Sherrington, is a particularly strong feature of the book. The accounts of the various diseases are almost too condensed to be attractive reading, but are comprehensive and good.

Nothing remains to be said of the 'Dictionary of National Biography' (London: Smith, Elder & Co.; New York: Macmillan), when mention is made of its conclusion by the third volume of the Supplement. Nothing, we mean, of the nature of this grand and disinterested enterprise. Between How and Wood, it is but natural to remark how many great names are gathered up from the dead of the period during which the main work was in progress. Victoria takes precedence with 112 pages, and Ruskin follows next with 23; but here also are Max Müller, Jowett, Huxley, Newman, James Martineau, Sir A. H. Layard, and many lesser lights, from Isaac Pitman to Orton, the Tichborne claimant. Of special interest to Americans are Fanny Kemble, Tom Hughes, Dr. McCosh, and W. J. Linton, whose wife also is recorded here, in obedience to the dictionary-maker's injunction not to put asunder what alphabetically belongs together.

The sixth volume in the second series of the great quarto Index-Catalogue of the Library of the Surgeon-General's Office is distinguished at once by the fact that whereas in the first series only four and a half pages were occupied by the works of Galen, or commentaries upon them, the subsequent accessions fill seven pages, and go back as far as 1501. Guy de Chauliac, again, who was invisible in the first series, here fills a page with editions from 1480 down. These two facts show the persistency with which the marvellous collection is perfected in the older portion. Many complaints, and members affected, and branches of medical science—Gall-bladder, Glaucoma, Head, Heart, Gynæcology—requiring much space, occur in this instalment (G-Hernette). Even the layman can profitably resort to such topics as Health-resorts or Heating; and it is hard to say what common folks may not chance upon here—Goats, Gorillas, Giraffes, Guano, Grindstones, Handkerchiefs (their suppression being called for by one author in order to ward off contagious diseases like tuberculosis, etc.). This is not more surprising, perhaps, than Theophilus Garencieres's "true and genuine tincture of coral in physick, grounded upon reason, established by experience, and confirmed by authentical authors in all ages" (London, 1676). Goethe's works have found a place, and Goldsmith (for it is a moot question whether he was ever a physician) had to be entered. Garfield, for his case, and Guiteau for his insanity, Grant for his cancer, furnish other rubrics. And Dr. S. A. Green, prolific in much good matter, contributes his copy of the laws of Harvard College of 1855, with an introduction. To a Dutch edition (1652) of Hermes (Trismegistus) is appended a reference for his life and another for his portrait; and this is but a sample of the pains bestowed upon this invaluable repository of medical information.

M. Jules Martin's annual 'Nos Artistes' (Paris: Paul Ollendorff) passes in review, with portrait and sketch of career, 358 actors, actresses, operatic and concert singers, and dancers, and affords a valuable study of character and talent. The provinces vie with Paris in producing these lights of the stage, and even Sacramento, New Orleans, and Boston gave birth to as many actresses in this gallery. While many countries of Europe have contributed of their natives, if any one was born in Germany, it is, we believe, not revealed here. Among the female caprices are the withholding of place and date of birth, or at least year of birth, or the leaving the date to be reckoned by any one who will take the trouble. One actress alone supplies no portrait of herself. Notice is duly taken of rebuffs at the door of the Conservatoire. An American can but be struck by these physiognomies in respect of training and intelligence in comparison with the expressionless faces of the majority of the craft in this country. M. Martin supplies an index of names, though the arrangement is alphabetical, and adds historical accounts of the various theatres, of dramatic societies, etc.

The serial "Meisterbilder fürs Deutsche Haus" (Munich: George D. W. Callwey; New York: Lemcke & Buechner) runs on with twenty-four sheets to date, embracing latterly the Holbein Erasmus, Dürer's Hieronymus Holzschuher and "Feldschlange," Raphael's Sistine Madonna (in whole and in part), Rembrandt's "Raising of Lazarus," Michael Angelo's "Creation of Adam," Leonardo's "Mona Lisa," besides examples from Cornelius, Titian, and Velasquez. The inner pages of the wrapper of each plate discuss the picture, the artist, and the mode of reproduction. These pictures well deserve a place in the schoolroom as well as the home, and rare will be the direct art instruction which can compete with the silent influence of such masterpieces (daily viewed) in the formation of taste.

Petermann's *Mitteilungen*, No. 11, contains an account of a visit, on behalf of a German company, to some gold districts in the northern part of the province of Pechili by Dr. K. Vogelsang. He reports that the alluvium gold is apparently exhausted in the region visited, and the natives have stopped mining. Only a few places seemed to warrant a more extended survey. A carefully drawn map shows the geological features of the country immediately adjacent to his route. Dr. Herrmann concludes his examination of the history of the Pitcairn Islanders, particularly of the population statistics, since 1800, and maintains that, notwithstanding recent favorable reports of the present condition of the islanders, the facts show the inevitable tendency to degeneration of a mixed race of whites and natives leading a perfectly isolated life.

"Certain Aboriginal Remains of the Northwest Florida Coast" is the title of a memoir by Clarence B. Moore in the latest number of the Journal of the Academy of Natural Sciences of Philadelphia. It is the result of the exploration of twenty mounds along the shores of Perdido, Pensacola, and Choctawhatchee Bays and Santa Rosa Sound. Mr. Moore describes a new form of burial, where a skull alone, or a skull with a few bones, lies beneath an inverted vessel of earthenware. A similar method of interment was practised in Georgia, but there the remains had been cremated, while evidences of cremation have not thus far been met with on the northwest Florida coast. A most striking collection of purely aboriginal earthenware has been obtained from the mounds and cemeteries explored. Its decoration, which is largely symbolical, and its make show a mixture of cultures. There are many of the life forms of the ware of the Middle Mississippi region, but the admixture of coarsely powdered shell found in that section does not appear in the clay of the Florida vessels. The complicated stamp decoration of Georgia and of the Carolinas is met with, but not the tempering of the clay with small pebbles to form "gritty ware." The paper is profusely illustrated. The same number of the Journal contains a shorter article, by the same author, on "Certain Aboriginal Remains on the Tombigbee River." The absence of cremated remains thereabouts, as well as in northwestern Florida, shows that the custom of cremation was not introduced by way of this region into the peninsula. It is probable that it passed through Georgia, where fragments of cremated bones, either covered with inverted vessels or placed in vessels capped by inverted bowls, are plentiful.

By the accidental dropping of a line on page 19, column i. of last week's issue, the third sentence of the closing paragraph was deprived of sense. It should have read: "Particularly interesting is the association of melancholia with disturbance of the central area of the parietal lobe."

—The editor of the *Atlantic* opens the new year with a somewhat mournful consideration of the "Cheerless Reader," who makes his days and nights unhappy with streams of sorrowful correspondence after each issue of his magazine. The "Gentle Reader" of the olden day is no more, and the "Cheerful Reader" shows signs of disappearing too; soon nothing but the "Intelligent Reader" will be left, and then "the world of

periodical literature will be a dismal world indeed." But perhaps the editor will come to think better of the situation by reflecting that it is really a high tribute to the character of a periodical when readers who cannot peruse an article which goes against the grain of their own habits of thought without a blow in return, still cannot leave it unread. The editor tells us that the *Atlantic* is to continue what it has been in the past, and that can only mean that it is to be a magazine with a mission. To any such the objecting reader is an inevitable accompaniment, and is really a sign that the remedies which it is administering to the body politic and social are taking hold. R. Brimley Johnson's article on "England in 1901" is a searching piece of criticism on present conditions and tendencies across the sea, and, in its most important facts and conclusions, equally applicable here at home. Mr. Johnson strikes a sturdy blow against "the magic illusion of phi'anthropy, by which a man is led honestly to believe that he is conferring a benefit on others by shaping them after his own image"; the primitive and unphilosophical assumption that all who cannot appreciate the blessings of our civilization should be wiped off the face of the earth; "the foolish process of remoulding nations on Birmingham patterns." As to the African situation specifically, the present conditions are inevitable "till something shall knock enough sense into us to shake hands with an honorable enemy." Mr. Rollo Ogden calls attention to "The New Powers of the National Committee." The chairmen of our party National Committees, by virtue of the large sums of money collected and expended under their control, and their hold upon official patronage, are threatening the independence of the executive and legislative departments of the Government. In other words, we are setting up a machine calculated to reproduce at Washington the situation which has been such a blight at various State capitals, preëminently Harrisburg and Albany. Professor See contributes an enthusiastic and heartening paper on recent progress in astronomy, upholding the view that this and kindred sciences are by no means finished; and he indicates pathways along which there still are hopeful chances of new and far-reaching discoveries. He pays high tribute to the deserving work of Campbell, now the director of the Lick Observatory. Doppler (not Doeppler) was the first to enunciate the widely applied principles of spectral determination of motion in the line of sight—and in 1842, not 1840. Also, Wollaston first showed the spectral lines in 1802, twelve years before Fraunhofer's map was made—not in 1826, twelve years after, as Professor See states.

—The last four volumes of the series entitled 'Modern Eloquence' (Philadelphia: John D. Morris & Co.; New York: University Publishing Co.), consist of three of Occasional Addresses and one of Anecdotes and Illustrations, with "indices" which turn out to be a "general index"; the anecdotes and illustrations being relegated to a topical classification of very limited aid to "practical utility." The Addresses are naturally of more permanent value than the preceding After-Dinner Speeches, and will compare not unfavorably with the Lectures; but they have been chosen with absolutely no discrimination for style or intrinsic worth. On either ground it would be impossible to include the two examples of Mr. McKinley's "modern eloquence." He is at one extreme of diction from (say) Judge Oliver Wendell Holmes, whose prose has few equals; and in commonplaceness the late President has here no superior. Hugo and Zola are in line with Englishmen and Americans. Among our own orators we encounter Phillips Brooks on Lincoln, Blaine on Garfield, Rufus Choate on Webster, Curtis on Lowell, Warner on Curtis, Schurz on Gen. Sherman, Olney on Marshall, Mabie on Poe. Here, too, is Clay's address to Lafayette, Charles Francis Adams on "A College Fetish," Dana on Journalism, Lowell on Democracy, Roosevelt on the "Strenuous Life" (in the same volume with Booker Washington on "The Progress of the American Negro"), Stedman on Stevenson. In the English contingent we remark Pater on Raphael, and Rosebery on Burns; also, Chamberlain on "Patriotism," speaking in 1899, before Kruger had gone to war for *his* patriotism, but with a prophetic flouting of "l'ami du genre humain," and an apology, echoically American, for the patriotic view "of the expansion of the Empire in which we seem to be fulfilling the manifest duty of our race." An early discourse by Henry Cabot Lodge to Harvard students on the "Uses and Responsibilities of Leisure" some will think to have been unduly neglected by its author in his own case. And Senator Hoar's Charleston laudation of South Carolina and Massachusetts, while suppressing even a remote allusion to his father's having been mobbed out of the State on his mission from the Commonwealth to protect her colored seamen in 1844, may mark the want of a sense of humor at least. These volumes, like the first six, are freely illustrated with portraits, mostly excellent.

—Far better specimens of the typographic art are the two volumes of select 'New England Society Orations' edited by Cephas and Eveline Warner Brainerd, and published for the New England Society of New York by the Century Company. What strikes us here is the general oblivion which has overtaken many and is rapidly overtaking more of the orators grouped together. To the country at large the names of Gardiner Spring, J. B. Romeyn, Philip M. Whelpley, C. B. Hadduck, Jonathan P. Hall, Samuel L. Knapp, George S. Hillard, and C. W. Upham are as unfamiliar as those of the present Cabinet Ministers of Italy. In a second plane of recession are John Pierpont, Horace Bushnell, Leonard Bacon, George B. Cheever, William Adams, R. S. Storrs, and Robert C. Winthrop. And at the end of the present century what will be the "*un*submerged tenth" of the remaining names—Webster, R. Choate, O. W. Holmes, Emerson, G. W. Curtis, W. M. Evarts, George P. Marsh, and Mark Hopkins? The value of this collection lies in the manifold playing upon a single string of "the day we celebrate," both in the practical application of New England principles to current events, and in the avoidance thereof. The historian of witchcraft, Charles W. Upham, speaking on Forefathers' Day, 1846, saw no peril to the Union except "on the part of those persons who feel themselves implicated in objectionable institutions maintained and cherished in some of the States." Add "a certain description of ignorant and insolent foreigners." In 1838, the Rev. Leonard Bacon, alluding to the murder of Lovejoy and the burning of Pennsylvania Hall, defended the Puritan treatment of the Quakers, who "deserved to be punished, not for their opinions, but for their actions," and found their successors in "the anti-slavery agitators of our day," who, in an age more tolerant of free speech, had the misfortune to be punished by mob rather than as were the Quakers of old (lucky dogs!) by law. The passage in which this comparison occurs will bear much study by one wishing to arrive at the orator's real attitude towards the abolitionists—especially if the student comes to it ignorant alike of them and of Dr. Bacon.

—'Dames and Daughters of Colonial Days' (T. Y. Crowell & Co.) is a brightly written series of studies by Geraldine Brooks. Only one of the ten women whose lives are here briefly but entertainingly described is likely to be familiar to the general reader. Martha Washington, the beautiful "Widow Custis," is a household word; but few people know anything about the life of Elizabeth Schuyler, the wife of Alexander Hamilton, or of Margaret Brent, the woman who governed Maryland, or in fact of the other patriotic and heroic beauties whose portraits adorn these pages. In the companion volume, 'Dames and Daughters of the Young Republic,' we move in a society a little less remote, and encounter the ill-fated Elizabeth Patterson, whose high spirit and beauty may win one's sympathy if one ignores her disposition, which was, to say the least, not ingratiating. Among the portraits here given are those of "Dolly" Madison and Emily Marshall. The latter's claim to a place in the series is frankly based on her personal charms, which were unquestionable. Are American women so universally charming nowadays that we take them as a matter of course, or is real beauty as rare as ever? Is it, in fact, conceivable that, given a twentieth century Miss Marshall, she could, by her mere appearance, shake the composure of the chief cities of this continent? At any rate, the lady who in her day left no one unmoved, from the President and the Judges of the Supreme Court to the workmen who forgot their dinner hour in the mere expectation of her passing by, has the right to rank as an historical personage, and the record of her triumphs can be recommended to while away a holiday half-hour. The general get-up of these volumes is pleasing, and the illustrations are pretty and appropriate.

—The present Duke of Argyll, better known as the Marquis of Lorne, had exceptional opportunities of studying the character of the late Queen of England. His biography of her, published by Harper & Bros. under the title 'V. R. I. Queen Victoria: Her Life and Empire,' does not, however, contain much information that is not accessible elsewhere. The most interesting of the particulars that have not previously appeared are the extracts from the journal of one of her Majesty's tutors, and the reminiscences of the Queen's childhood contributed by the late Duchess of Cleveland. Brief quotations are also made from a few of the Queen's letters to intimate personal friends. In the main, the author draws upon the usual sources, which he seems to have read rather carelessly. For example, his account of the royal travels in 1846 is so confused

that he places the Restormel mine in Guernsey instead of in Cornwall. His misquotation of her Majesty's favorite hymn, "Peace! Perfect Peace!" makes nonsense of the last line. His references to the history of the country outside of the personal record of court events are scrappy and misleading. It is obviously absurd to begin an outline of the Afghan question with a reference to the murder of Cavagnari, as it is also to introduce South African affairs by mention of Lord Carnarvon's proposals for confederation. It is, indeed, impossible to guess at the principle which has guided the writer in his selection of topics. A paragraph, for instance, is devoted to the death of Victor Hugo, whose recognition here appears to be due to the fact that he lived for a time in one of her Majesty's possessions. But the only events of English literary history that find a notice are the foundation of the *Illustrated London News* and the writing of 'All Sorts and Conditions of Men.' It is curious to note the Duke's comment on the succession duties, "which make country estates pay more than they can bear, and thus diminish to a serious extent the opportunities for occupation hitherto afforded."

—MM. Armand Brette and Edme Champion have published an interesting volume entitled 'La France au milieu du XVIIe Siècle (1648-1661) d'après la Correspondance de Gui Patin' (Paris: Colin). The letters of this singular but celebrated physician were published posthumously in 1683, and long enjoyed wide popularity. For example, the article on Patin in Bayle's 'Dictionary' contains the strongest testimony to their fame. "They are so well known by every one," says Bayle, "that it is unnecessary for me to speak of the author's merit." From the seventeenth century to the days of Sainte-Beuve, Patin's correspondence had a well-recognized place in French literature, never ranking among the masterpieces, but always claiming a certain amount of notice from its frank pessimism and downrightness of utterance. There are a great many of the letters, and latterly they have dropped out of sight a good deal, partly because Patin's professional reputation tends to decline, and partly because his correspondence is not only bulky but somewhat monotonous in tone. The present edition is based less upon enthusiastic admiration than upon the desire to render accessible a certain kind of historical evidence. Patin was a contemporary of Richelieu, Condé, and Turenne—a contemporary, also, of Louis XIV. and Colbert. He lived at a time when France was humbling the House of Austria in both branches, gaining fresh territory by the Peace of Westphalia, and shining forth in full splendor before the eyes of an astonished Europe. Yet Patin sees none of this. He is a caustic critic of prime ministers, he lashes the vices of society with fierce asperity, and nothing that occurs in either Paris or the realm seems to him really good. Doubtless such melancholy views are due to temperament, and the generation should not be judged by the witness of a sombre physician. Nevertheless, these letters deserve to be known and considered, the more because the times which they depict are so often judged by their brilliant achievements in arms and letters. As M. Champion says at the close of his introduction: "Aussi, plus Patin nous surprend, nous scandalise, et plus il nous rend service." There was at least one man who scorned the triumphs of Louis XIV. and saw what was least pleasant in an age of glory. MM. Brette and Champion print but a portion of the letters, and hope only to illustrate the value of Patin's strictures upon contemporary life. Selecting the period of the Fronde, they give the passages which best represent his attitude towards men and events. For ordinary purposes their abridgment will be more serviceable than the complete text, and in many ways it is better than the three-volume edition of Reveillé-Parise.

GREEN'S LETTERS.

Letters of John Richard Green. Edited by Leslie Stephen. The Macmillan Co. 1901.

It is now more than eighteen years since Green died, and although there have appeared essays upon him by Mr. Bryce, Mr. P. L. Gell, Mrs. Humphry Ward, and Mr. W. J. Loftie, besides those by Haweis and Freeman, the authoritative collection of letters with biographical comment is only appearing at this late date. Why the publication of his correspondence has been retarded we have no right to ask. That the delay cannot be traced to any want of devotion might be inferred, if other evidence were lacking, from the beautiful edition of his 'History' which Mrs. Green has prepared with such great care. Green had many stanch friends, too, and a devoted publisher. At any rate the work is now in print. As for the postponement, Mr. Stephen says in the opening sentence of his preface: "I must ask readers of these letters to take for granted that there have been sufficient reasons for the long delay in their appearance."

The book was worth waiting for, and it will have the effect of heightening Green's reputation as a man of talent and distinction, if not, in certain respects, of positive genius. The favorable impression is the deeper because the test is so severe. It was not one of those lives which make an inevitable appeal through the element of action. It was devoid of striking incident, or indeed of any incident at all save such as is supplied by the employments of a curate in East London, and by a constant change of residence in search of health. Nor has the meagre material which a quiet life affords been embellished by the special pleading of an enthusiastic biographer. No one now living is better qualified to write biography than Mr. Stephen. Both his gifts and his experience are quite exceptional. But in the case of contemporaries the biographer is expected to have known intimately the man of whom he writes. As it happens, Mr. Stephen's acquaintance with Green was slight, and upon this ground he thought himself unfitted to undertake even the task of editing the letters. "When, however, Mrs. Green came to the conclusion that, under all the circumstances, the proposed arrangement would be most satisfactory to her, I could no longer hesitate." We have said that the test is a severe one. Mr. Stephen feels placed under an imperative restriction by having known Green so slightly, and remains for this reason in the background. His part of the work is done to perfection, but it is relatively inconsiderable. The effect, favorable or unfavorable, depends upon the quality of the letters alone, and it is because they disclose Green's aspirations so clearly that they create a stronger sense than before existed of his ability and character.

Green owed nothing to fortune except the place of his birth, and a father, "of great tenderness and simplicity," who took an interest in the boy's questions and answered them by saying: "I do not know, but I will try to find out." He was born at Oxford in 1837, and came of humble family. His grandfather was a tailor, his father a "registrar and maker of silk-gowns for Fellows." There seems to have been no sign of genius in previous generations; and though Green received financial assistance from relatives when he was an undergraduate at Jesus College, he was but little indebted for his success to the influences which are communicated by highly educated parents and a refined home. This fact is the more remarkable inasmuch as he developed great delicacy of perception, and an innate refinement which the self-made do not always possess.

At school and college, Green began to show originality, but his interests carried him beyond the bounds of a stereotyped curriculum. Gibbon "arrived at Oxford with a stock of erudition that might have puzzled a doctor, and a degree of ignorance of which a schoolboy would have been ashamed." Green's case was doubtless similar during the years of his residence at Jesus. Like Gibbon, too, he gained from his studies at Oxford little profit and less pleasure. For Jesus College and its Welshmen he grew to entertain a positive dislike, which, after it had been softened by years, was expressed in the form of banter. "I don't love Edward First (as I showed t'other day), but I wouldn't abuse him so if he had really hung those bards. But he didn't." And of Jesus College he says: "£5,000 are spent annually in that vile place on 'Welsh Education.'"

While Green's career at Oxford was undistinguished by a Hertford or an Ireland, he did not leave the University without giving some hint of his strong predilection for history. Besides attracting the notice of A. P. Stanley, he wrote a series of papers upon "Oxford during the Last Century," which is marked by the best qualities of his later work, extreme vivacity and solid information. Unfortunately, these articles were buried in the columns of a local newspaper, and brought the author neither distinction nor encouragement.

In the choice of a profession, Green was largely influenced by the teaching of F. D. Maurice. Under the spur of enthusiasm he decided to enter the Church, and the work which he did as a clergyman between 1861, when he was ordained, and 1869, when he abandoned the clerical character, was of the most honorable and disinterested kind. Despite his wretched health, his growing fondness for history, and the gradual change of his theological opinions, he kept practical duties manfully before him until the last. The cholera of 1866 found him at his post in Stepney, where he worked, in the words of Mr. Gell, "as officer of health, inspector of nuisances, ambulance superintendent, as well as spiritual consoler, and burier of the dead." Mr. Stephen adds: "On one occasion he found a man dangerously ill in an upper room. Some big draymen in the street refused to help. Green therefore tried to carry the man down stairs. His slight frame was unequal to the effort, and the two fell

from the top to the bottom of the stairs together."

At length liberalism broadened into a state of mind which involved doubt upon important matters of Christian faith. Green, however, had no wish to vex the Church with his heresy, and withdrew from the priesthood upon the valid plea of ill health. Thenceforth until his death he supported himself by writing for the *Saturday Review*, editing for Macmillan, and publishing books on English history. During the last ten years and more he was struggling with consumption—a doomed man fighting with all his might to do his work, and do it well. After many trials success came with the publication of his famous 'Short History'; success, but not health. Mrs. Humphry Ward has described "the afternoons, in his later years, when the pretty house in Kensington Square was the centre of a small society such as England produces much more rarely than France. Mr. Lecky came—Sir Henry Maine, Mr. Freeman, Mr. Bryce, Bishop Stubbs sometimes, Mr. Stopford Brooke, and many more. It was the talk of equals, ranging the widest horizons, started and sustained by the energy, the undauntedness of a dying man. There in the corner of the sofa sat the thin, wasted form, life flashing from the eyes, breathing from the merry or eloquent lips, beneath the very shadow and seal of death—the eternal protesting life of the intelligence."

Such in briefest outline were the events of Green's life. The letters begin a short time before he left Oxford, and cover, almost exactly, the years 1860-80. He lived until 1883, but towards the end he was prevented by illness from writing letters, save at the longest intervals. During the period in question his chief correspondents were Prof. Boyd Dawkins, the late Professor Freeman, Mrs. Creighton and her sister, Miss Olga von Glehn; Miss Stopford, afterwards his wife, and Mr. and Mrs. Humphry Ward. He must have written to many others, but the vast majority of the letters here given are addressed to those who have been mentioned.

The charm of a volume like this vanishes beneath the abridgments of the reviewer. Long quotations, were they possible, might do something towards expressing the wit, or the animation, or the good feeling which so abound; but Green's gifts were versatile, and quotations, however copious, could illustrate only a part of his activity. His letters were like his conversation. Mrs. Humphry Ward emphasizes the essential feature of both when she says: "His talk *gave* perpetually; much of the previous talk of the world has not been a giving, but a gathering and plundering talk. But Mr. Green's was talk of the best kind, abundant, witty, disinterested; and his poet's instinct for the lives and thoughts of others, his quick imagination, his humorous and human curiosity about all sorts and sides of things, made pose and pedantry impossible to him." Generosity is a fine trait, but its practical value depends much upon the resources at command. Green always made free with what he had, and his profuseness meant the more to his friends because it flowed from an unfailing source of intellectual, moral, and human interest. Ill health so long continued and wearing brought with it moments of physical depression; yet the mind was ever eager, the will and spirits ever ready to revive.

Mr. Stephen, with true insight, observes of Green that "though no one was more thoroughly English in his sympathies, no one had less of the quality connoted by the 'Anglo-Saxon' of ordinary discourse." His letters bear out this view conclusively. He was far more open to stimulating impressions than most Englishmen are, even among the élite. Without yielding to a weak eclecticism or losing intellectual vigor through imitation, he drew from all quarters and profited by his docility. The subjects of his leading works are English, and he felt that the Englishman ought by his superior opportunities to reach a truer conception of history than is within the grasp of the German pragmatist. It may be said, and this is quite true, that he had not mastered the historical literature of Germany. Here, in point of detailed knowledge, lay one of his limitations. At the same time, he admired Ranke and Pauli, appreciating their love of thoroughness, praising their erudition, and knowing quite well the nature of their methods. As a rule he was on the watch for the best in thought and literary standards which foreign nations could supply. From early days he had a great love of French prose. From the time of his first visit to Italy he became enraptured with that land "of enchantment and the arts." The older he grew, the more cosmopolitan were the sentiments which he announced. Having begun at the feet of Maurice, he drew close in middle life to Hellenism. He was forty years old when he wrote thus:

"But these owls always get between one's soul and the sun—as if sunshine was something dangerous. Ah me, I fear I shall always be more Hellenic than Christian—but life, life in all its energy and brightness and quick movement, life in all its quick interchange of laughter and tears, why do these men fear it so and preach it down? They preach it down! They go their way and the sun shines on, and the world laughs for freedom and for joy!"

England has her great poets and her unpoetic millions. Perhaps all that has just been said may be compressed into the statement that Green, besides having the national virtues of energy and determination, was gifted with imagination. Unlike most Englishmen, he went through the world with his attention alert and his sympathies undulled by contact with the commonplace. To be a perpetual curate in Stepney was not, with him, to be made insensible by "endless rows of monotonous streets." He caught the poetry of East London: "Poetry in the great river which washes it on the south, in the fretted tangle of cordage and mast that peeps over the roofs of Shadwell, or in the great hulls moored along the wharves of Wapping." And it was by virtue of an answering emotion that he seized upon the best which men had done in the past or were doing about him.

It would be ludicrous to set down, item after item, an epitome of the tastes and aptitudes which these letters reveal. The main thing is that they are alive with the sparkling spirits of the writer, or, when serious, that they are instinct with a sense of strong and penetrating earnestness. Green began letter-writing with a view to perfecting his style, and the results are at first amusing, because each phrase is the product of sedulous care. The writer is keeping a copy against the possible loss of such an elegant composition. But soon, wonderfully soon, a change becomes noticeable. The undergraduate disappears, and his place is taken by a young lion, whom John Douglas Cook is glad to have on the staff of the *Saturday Review* in its best days. Carlyle's contributions to the 'Edinburgh Encyclopædia' differ little more from 'Sartor Resartus' than Green's letters of 1858-60 differ from those of 1865-70.

The staple of letters is friendship, and Green was a good friend. Having lost his parents when very young, and having passed his boyhood among somewhat uncongenial surroundings, he took the keenest delight in the affection and the marks of affection which he afterwards received. Mrs. Ward, the wife of his first rector, he loved and mourned as a son might do. Beneath the fun and gossip of his letters to Professor Boyd Dawkins there is always an undertone of tenderness. He was considerably younger than Freeman, who remembered him as "little Johnny Green." Afterwards, when both were working hard on English history, acquaintance ripened into friendship. Freeman got Green his chance to write for the *Saturday Review*, and they exchanged letters constantly. In these the younger man shows proper respect towards his senior, but without dropping a tone of outspoken criticism when it is called for. Then, after a frank statement of opinion, the letter may close: "Yours in all Johnnyhood, J. R. G."

On the whole, the best part of the correspondence is that which is addressed to women. Green's enthusiasm and sprightliness make him at times seem almost feminine. Better still, he had an intuitive regard for ideas and emotions that are rarely understood by men. When writing, for example, to Mrs. Creighton or Miss von Glehn, he speaks less of events than of men and women; he gives freer play to his fancy; his persiflage has a gayer ring. He loved to write light articles for the *Saturday Review* on "Children at the Beach," the "Buttercup" or débutante, and the "Ethics of Flirtation." In politics and religion Green was a liberal, but above all other things, he was a humanist. Hard work did not check the abundance of his humor, nor did ill health or religious doubt lessen his sympathy for every kind of generous endeavor. The tragedy came at the close, when the complete happiness of his married life was cut short by the disease against which he had battled with almost unexampled courage. It is with these words that Mr. Stephen closes his notice of Green's last years:

"Sir Lauder Brunton said that his force of will and enthusiasm for his work had kept him alive for two years longer than any doctor would have thought possible. He told his wife that what had kept him alive was his dread of separation from her. Many years before, he had said, I know what men will say of me; they will say, 'he died learning.' Mr. Humphry Ward adds that they will also say, 'he died loving.' "

We may hereafter speak of the way in which these letters are likely to affect the estimate of Green's historical writings. Here it may be said that they depict to the life a brave, enlightened, high-spirited, and most talented man.

BEERS'S ENGLISH ROMANTICISM.

A History of English Romanticism in the Nineteenth Century. By Henry A. Beers. Henry Holt & Co. 1901.

Our readers will remember that in a review of Professor Beers's earlier volume, 'A History of English Romanticism in the Eighteenth Century,' some exception was taken to the definition and delimitation of the subject. Now, in the preface to the present volume, he reasserts that by "Romanticism" he means nothing more nor less than mediævalism, and expresses the hope that "this second volume may make more clear the unity of his design and the limits of his subject." This hope is, in a measure, realized. His wisdom in confining his attention chiefly to the bellettristic aspects of his subject is even more evident than in the first volume, yet enough is said of the characteristic artistic, economic, and religious movements of the late lamented nineteenth century to produce that impression of completeness in unity at which Professor Beers has aimed. There are, indeed, numerous passages in which the lack of perspective implied in practically limiting the Romantic to the "Gothick" causes a certain inadequacy in the criticism. In general, Professor Beers is at his best, not where the demand is for sustained historical erudition, or strict analysis with fine, unblurred distinctions, but where there is need of taste in forming and realizing an impression, and play for a gift of humorous and picturesque phrase in expression. He is not the final systematic historian of the thing which most critics have agreed to call English Romanticism; he is an agreeable essayist on a few of its manifestations.

The initial study of Scott is, in respect to originality, coherence, and vividness, easily the best in the book. It is so full of apt and telling criticism in detail that it will be well to quote some pregnant sentences from it *passim*, so as to convey the drift of the criticism:

"The key to Scott's romanticism is his intense local feeling. That attachment to place which, in most men, is a sort of animal instinct, was with him a passion. . . . His absorption in the past and reverence for everything that was old, his conservative prejudices and aristocratic ambitions, all had their spring in this feeling." "Scott [this in a comparison of "Helvellyn" with "Fidelity"] was a lover of dogs — loved them warmly, individually, so to speak, personally; and all dogs instinctively loved Scott. Wordsworth had a sort of tepid, theoretical benevolence toward the animal creation in general. Yet, as between the two poets, the advantage in depth of feeling is, as usual, with Wordsworth." "Scott is always a little nervous when the lover and lady are alone together." "His show passages are such as the fight in the Trosachs, Flodden Field, William of Deloraine's ride to Melrose, the trial of Constance, the muster on the Borough Moor, Marmion's defiance to Douglas, the combat of James and Roderick Dhu, the summons of the fiery cross, and the kindling of the needfires—those romantic equivalents of the λαμπαδηφόροι in the 'Agamemnon.'" "The eighteenth-century historians were incurious of *life*. . . . Gibbon covers his subject with a lava flood of stately rhetoric which stiffens into a uniform stony coating over the soft surface of life. Scott is primarily responsible for that dramatic, picturesque treatment of history which we find in Michelet and Carlyle."

From the romantic point of view, all this is, in its way, admirable criticism, and the final impression we derive of Scott as a modern Don Quixote, a little less mad, is, we believe, as just as it is vivid. It is to be regretted that in the course of so excellent an essay we should find a reference to the idiots in "MacArthur's Hymn," who complain that "steam spoils romance at sea." Indeed, the proof-reading throughout the book is none of the best.

The two chapters which follow upon "Coleridge, Bowles, and the Pope Controversy," and "Keats, Leigh Hunt, and the Dante Revival," exhibit the same characteristic qualities as the "Scott." In both many readers will see defects springing from the exclusion of Platonism and the Orient from among the sources of "romantic" inspiration. It is a strange definition of Romanticism which must be wrenched to make it cover "Thalaba" and the "Ode on the Intimations of Immortality," or "Epipsychidion" and 'Vathek.' Nevertheless, like all of Professor Beers's writing, these chapters are full of felicitous judgments and memorable sentences. The differentiation of Keats's romantic subjects from Scott's is particularly good. Granting the romantic programme proposed by Ariosto in the opening lines of the 'Orlando Furioso,' Scott, says Professor Beers, "took for his theme *arme* and *audaci imprese*, while Keats sang of the *donne*, the *amori*, and the *cortesie*." He was the poet of the lute and the nightingale, rather than of the shock of spear in tourney and crusade. His "Specimen of an Induction to a Poem" begins—

> "Lo! I must tell a tale of chivalry."

"But he never tells it."

The succeeding chapters, dealing with "The Romantic School in Germany" and "The Romantic Movement in France," were, of course, essential to the full rounding of the theme; while they move rather perfunctorily, they are still very readable. In view of the fact that Professor Beers's self-chosen subject has to do with mediæval *motifs* in nineteenth-century literature, it is a little odd that, in speaking twice of the singularly romantic effect of the horn in "Hernani," he makes no mention of its very obvious relation to the famed blast that Roland blew at Roncesvalles.

In the discussion of "Diffused Romanticism" and "The Pre-Raphaelites" there is much that is stimulating and suggestive, and a little that is perplexing. Writing of Swinburne, Professor Beers says: " 'Laus Veneris' follows a version of the tale given in Maistre Antoine Gaget's 'Livre des Grandes Merveilles d'Amour' (1530), in which Venusberg is called 'le mont Horsel.' " If Professor Beers has had the advantage of perusing Gaget's book, a description of the copy would be of the highest interest. It has been suspected by a skeptical generation that the half-page of old French prefixed to "Laus Veneris" is a *jeu d'esprit* of the creative imagination. At any rate, there is no such work in the library of the British Museum, and no mention of either Gaget or his book in Quérard, Larousse, Lacroix, or Chevalier, in the exhaustive 'Bibliographie de l'Amour,' or in the thirty-four fat folios of the 'Universal-Lexicon.' We fear that the seeker after the 'Livre des Grandes Merveilles d'Amour' is likely to experience the disappointments of one who would acquire for his collection the novels of Arthur Pendennis or the tracts of Dr. Primrose.

The final chapter, treating of "Tendencies and Results," is suggestive again, but inconclusive. The trouble is, that Professor Beers has chosen to adopt too narrow conceptions of both Classicism and Romanticism. It is perfectly true, as he urges in his preface, that one has the right to start with any conception that will help him attain the end of his discourse; but confusion and inconclusiveness are sure to follow an attempt to confine a notion essentially various and vague within too strict bounds. Thus, Professor Beers's tendency is to consider all Latin humanism classic; whereas there is certainly a sense in which Virgil, the father of it all, is one of the most romantic of poets. Again, he is given to writing as if Classicism were a sort of iron shirt or strait-jacket for the muse, a thing abhorred of the poet. But, if we mistake not, the true classical spirit is simply the desire to live up to the highest standards in art and life, only presupposing an objective accumulation of such standards. Viewed from this angle, the classic and the romantic come to seem two perennially existing tendencies, and temperaments, opposite, indeed, but complementary rather than contradictory or mutually exclusive. From this point of view, Romanticism is a process of which Classicism is the attainment. Poets and artists seek the strange and the beautiful, each in his own way, until from their practice so-called classical standards are evolved. But no sooner do these become fixed than there ensues a new adventuring after beauty and strangeness, and a "romantic" period begins. If we give heed to such considerations as these, the "romanticism" of the last two centuries will appear not a "return to the mediæval," or to "nature," or to anything else, though these formulæ may describe certain of its aspects. It will be seen to be, rather, a resumption of the general course of literary evolution after an eddy of formalism, which, by reason of obvious social and political causes, had exhibited, as a matter of fact, less than usual of the true classical spirit.

Life and Times of William Lowndes of South Carolina, 1782-1822. By Mrs. St. Julien Ravenel. Boston: Houghton, Mifflin & Co. 1901. Pp. x, 257.

William Lowndes, the subject of this sketch, was born February 11, 1782. He was the youngest and only surviving son of Rawlins Lowndes, one of the best-known Revolutionary leaders of the South, President of South Carolina in 1778, and a prominent member of the Legislature which voted for a convention to ratify the Constitution. It is interesting to note that the father was a strong opponent of the new frame of government, declaring in the debate that he wished for no other epitaph than the words, "Here lies the man who opposed the Constitution because it was dangerous to the liberties of America." William was taken to England in 1789, where the characteristically unfeeling treatment which he received at school in punishment for a misdemeanor brought on rheumatic fever, and doomed him to invalidism for the rest of his life. He returned to Carolina in 1792, and finished his school life five years later, his teacher informing his father that the boy "had learned all he could teach him, and was beyond him." He then studied law, and in 1804 was admitted to the bar.

Although his education was distinctly English and Carolinian, Lowndes's political thinking had early begun to take a wider range, with the result of detaching him more and more from the Federalism which then dominated his State. How much such a change of opinion counted was shown in the strong objection raised to his marriage to a daughter of Thomas Pinckney, younger brother of Charles Cotesworth Pinckney. Lowndes was charged with being "a Republican," "a Republican-Democrat," a wanderer from Federalism; and the good offices of his friends were necessary to overcome the parental opposition. Years afterwards, commenting on the tenacity with which the Pinckneys held to their political creed, he observed that he had never been able to change his wife's opinions; and she in fact remained throughout a stanch Federalist. The practice of law proved distasteful, and after a year Lowndes withdrew, and until 1810 devoted himself mainly to the management of his estate. A series of articles in the Charleston *Courier* in reply to James Stephen's 'War in Disguise'—an attack on Jefferson's commercial policy—attracted attention, and led to Lowndes's election to the General Assembly, where he seems to have had an important share in the readjustment of the plan of representation then made, and which continued in force until 1866.

In 1810 he was elected to Congress, where his elder brother, Thomas, had represented Charleston from 1800 to 1805. With him went Langdon Cheves and John C. Calhoun, with both of whom he maintained thereafter an unbroken friendship. Clay, then Speaker, put Lowndes on the Committee on Commerce and Manufactures. Early convinced that the troubles with England and France could be settled only by war, he worked diligently for an increase of the navy, at that time, thanks to Jefferson's policy, wholly unprepared for active service; and he even seriously entertained the idea of entering the army. He was strongly opposed to the "caucus principle," which he characterized as "abominable," and refused, with Cheves, Calhoun, and others, to attend the caucus which renominated Madison. After the declaration of war, he tried to get a commission in the army, but withdrew his application on finding "that it would only be given on political grounds, and would not allow of active service" (p. 113). At the next session he was assigned to the Committee on Military Affairs, but, though still criticising the Administration for its temporizing policy, was unwilling to embarrass it by adverse action. He joined with Calhoun, however, in opposing Gallatin's proposed confiscation of the money accruing from the sale of imported goods which had been seized, and which was held by the Treasury, and, with Calhoun and Cheves, voted with the Federalists in favor of the remission of penalties under the Non-Intercourse Act.

In 1814, being then a member of the Committee on Naval Affairs, Lowndes voted for Calhoun's bill repealing the embargo, and put himself on record as unalterably opposed to privateering. He also supported Calhoun's plan for a bank, offered in opposition to that of Dallas. In 1815 he became Chairman of the Ways and Means Committee, and proposed and defended the tariff of 1816. There seems to be some reason for thinking, however, that Lowndes was not fully convinced of the ultimate goodness of the measure, but advocated it rather as "the best possible for the time" (p. 154). He was now a recognized power in the House. In 1816, and again in 1817, he declined the war portfolio, being determined, according to his biographer, "to be absolutely independent of all administrative favors" (p. 156); he also refused offers of the mission to France, and special missions to Constantinople and St. Petersburg. In the Fifteenth Congress he carried a bill abolishing the internal war taxes, and saw his favorite plan of a sinking fund successfully under way. In 1818 he supported Forsyth's bill against filibustering, and in one of his most notable speeches upheld the view of John Quincy Adams, then Secretary of State, on the question of recognizing the South American republics. He also made two speeches in favor of the banks. His last speech of the session was against the approval of Jackson's course in the Arbuthnot-Ambrister affair.

At the close of the session Lowndes went immediately to Europe for his health. His notebook is filled with observations on canals, factories, banks, hospitals, asylums, roads, politics, etc.; and his tall, striking figure, keen and varied interest in affairs, and unusual powers of conversation made a distinct impression upon those whom he met. In England, however, he failed, partly through his own fault, to meet some people, among them Lord Holland, whom he particularly wished to see, and in consequence conceived the existence of a pervading prejudice on the part of Englishmen against Americans. In France Gallatin helped him to interesting acquaintance. Thence he went to Italy, still continuing his copious record of whatever he saw. He returned to America in October, convinced that "nothing can make a man so proud of being an American as travelling in Europe" (p. 197).

In the great debate over the admission of Missouri, Lowndes, now Chairman of the Committee on Foreign Affairs, at first spoke but little, devoting himself to the Spanish treaty and tariff revision. His defeat the next year by Taylor of New York, in the contest for the Speakership, was a great disappointment, the office being the only one which he seems ever really to have desired. When the Missouri Constitution came before Congress, Lowndes drew up the report advocating its acceptance, and opened the debate with one of his greatest speeches. But his health was now rapidly giving way, and he was absent a good deal from the House. He returned to his seat in December, 1821, and in March presented a report from a select Committee on Weights and Measures, "proposing ways for insuring accuracy and uniformity." With the hand of death visibly upon him, it is strange to find him offered, and seriously wishing to accept, the French mission. The climax of his public career came a few days after his return to Washington in December, when the Legislature of South Carolina nominated him for President. The endorsement bade fair to bring him into rivalry with Calhoun, but death intervened. His health continuing to fail, Lowndes determined on a voyage to Europe, but died on the way, October 27, 1822, and was buried at sea.

Mrs. Ravenel has told in an interesting way the story of Lowndes's career. The loss or destruction of valuable papers has made the material scanty, and less use than could have been wished has been made of official documents. Enough has been drawn upon, however, to enable the author to construct a pleasant and useful biography of a South Carolina leader whose political tenets were also reasoned political convictions, whose public honors came unsought, and whose influence upon his generation, aside from that ascribable to unusual powers of exposition and argument, was due most of all to his lofty independence and keen sense of political and personal honor.

The Two First Centuries of Florentine History. The Republic and Parties at the Time of Dante. By Prof. Pasquale Villari. Translated by Linda Villari. Charles Scribner's Sons. 1901.

By this translation of her husband's book, Signora Villari has placed American students of Florentine history, and of Dante, under real obligation. In Italian the work has been known piecemeal for a long time, as much of it originated in lectures which Professor Villari gave in Florence, in 1866. These lectures he printed from time to time as magazine articles; then collected them in book-form, in 1890; and finally reissued them, with revisions and additions, in 1893. The result of this method of cumulative composition is naturally a series of important monographs, and not a consecutive narrative history. But the author frankly warns the reader of this fact, and of the further drawback that arises from the monographs being written at different times, so that the more recent are based on a wider knowledge of the subject than the earlier. For, thanks to Professor Villari's own researches, begun more than forty years ago, our knowledge of early Florentine history has been immensely extended. He has done most himself, and he has guided and inspired a notable group of younger men, who have studied in detail, with scientific zeal, almost every aspect of the period.

But, while a narrative history, cast at a single fusing, is usually to be preferred, it may be doubted whether, for several of the topics which Professor Villari deals with, the monograph is not the proper vehicle. Such subjects as "The Family and the State in Italian Communes," and "The Commercial Interests and Policy of the Greater Guilds in Florence," require to be treated by the massing and analysis of a multitude of minute facts, and not by narration, which best suits the chronicling of events. The same applies to the "Introduction," in which Professor Villari, after rapidly sketching the course of Italian development from the fall of the Roman Empire to the rise of the communes, states the philosophy of that epoch, as he sees it, announces the lines on which he proposes to investigate his main theme, and sums up its significance. We quote his summing up, because it will serve better than much reviewing to introduce the reader to Professor Villari's position as an historian of one of the vital crises in human development, and to his purpose in this particular work:

"It should not be thought that the Commune arose to champion the rights of man or in the name of national independence. Nothing of the kind. The Empire was still

held to be the sole and universal fount of right. Almost to the close of the fifteenth century, in fact, all cities, whether Guelph or Ghibelline, foes or friends of the Empire, continued to indite their state papers in its name. The revived republics always acknowledged its supremacy and their own dependence—almost, one might say, as though, in claiming a new and more general exemption, they only sought to be, as it were, their own dukes or counts. They combated the nobles and combated the Empire; but, victory once assured, they recognized the authority of the Emperor, and prayed him to sanction the privileges they had won. Nor was the destruction of the Empire at any time desired by the Popes; its protection was often indispensable to them, and they too recognized it as the legitimate heir of ancient Rome, and consequently as the only source of political and civil rights. Their purpose was to subject the temporal to the spiritual power. Therefore, during the rise of the Commune, theocracy and feudalism, Papacy and Empire still subsisted together, and always in conflict. The Commune had to struggle long against obstacles of all kinds; but it was destined to triumph, and to create the third estate and people by whom alone modern society could be evolved from the chaos of the Middle Ages. This constitutes the chief historical importance of the Italian Commune" (pp. 36, 37).

After this profound generalization, Professor Villari traces the history of Florence from its mythical origin, through the Roman and post-Roman times, to the coming of Charlemagne and the new feudal order, out of which, two centuries later, the Commune issued. He describes with sufficient minuteness the affairs of the eleventh and twelfth centuries, the rise of the people, the guilds, the private and civic life, and the great current and counter-current of the Papacy and the Empire. But it is the thirteenth century to which he properly devotes three-quarters of his space. Then definite parties sprang into being; then policies and personages with conflicting ambitions emerged; and then, finally, after generations of such a nervous and violent career as in recent times we associate with the semi-savage Spanish-American republics, the people triumphed. We cannot review Professor Villari's chapters in detail, but we can commend them almost without reserve. He succeeds as admirably in depicting every change in that kaleidoscopic story as in his generalizations. To take a single instance, we may cite his account of the chaos of factions which followed the downfall of Giano della Bella, and led to the banishment of Dante; he renders a permanent service here by showing how little the *grande politique* of Papacy and Empire, and how much the ambitions of grasping individuals, had to do with that terrific feud which shattered popular government in Florence beyond repair. Corso Donati's private schemes, his vindictiveness, his arrogance, his masterfulness, counted for more than the world-rivalry of Pope and Emperor in causing this calamity. Professor Villari ends with the abortive expedition of Henry VII. into Italy.

Signora Villari has made a readable translation, with only an occasional slip, like the use of such forms as *arisal* and *destroyal*, to indicate that her long residence in Italy has left any trace on her idiomatic English. This volume is provided with an index and more than twenty illustrations, which the original lacks. We wish that room might have been found for the rare Florentine chronicle which Professor Villari printed as an appendix to his Italian work.

Nova Legenda Anglie: As collected by John of Tynemouth, John Capgrave, and others, and first printed with new lives by Wynkyn de Worde A. D. MDXUI. Now re-edited with fresh material from MS. and printed sources by Carl Horstman, Ph.D. 2 vols. Oxford: Clarendon Press; New York: Henry Frowde. 1901.

Few people, perhaps, will be found to share the taste of Renan, who asserts in one of his essays that if condemned to a life of seclusion and limited to the choice of a single work with which to while away the hours of loneliness, he would select out of all books in the world the 'Lives of the Saints.' Nevertheless, the value of these productions has long been recognized, not only as reflections of the religious life of the Middle Ages, but as often embodying fragments of folk-lore and saga which might otherwise have perished. Among the workers in this field Dr. Horstman holds undisputed preëminence, as far as the Saints' Legends in their English forms are concerned, and he has still further increased the obligation of mediæval students to his industry by the two handsome volumes containing the Latin collection called 'Nova Legenda Anglie,' which have just issued from the Clarendon Press.

As is set forth in Dr. Horstman's introduction, this collection of lives of the saints of the British Isles exclusively is really due to John of Tynemouth, who lived in the first half of the fourteenth century although it passes more generally under the name of Capgrave. It is possible that the latter is responsible for the rearrangement of the lives in alphabetical order—not to speak of some other changes—which is already observed in certain manuscripts of the 'Nova Legenda' dating from the fifteenth century; but this is conjectural. At any rate, it was in this alphabetically arranged form, with some omissions and additions, that the work was first printed in 1516 by Wynkyn de Worde; but Dr. Horstman has restored from the unique Cotton manuscript the portions of the original collection omitted in the first printed edition, and has endeavored, moreover, to emend the text from the manuscript, and from the primitive lives on which the collection is based, wherever such were obtainable. Dr. Horstman does not make clear by what principle he was guided in his choice of readings, but, as the variants are given at the bottom of the page, the matter, perhaps, has no great importance.

It is to be regretted that considerations of cost and delay have compelled the editor to issue his work with an introduction, valuable, as far as it goes, but admittedly incomplete, the most obvious omission being in regard to the discussion of sources. Many will feel this deficiency, especially in the case of the lives of the saints of Celtic origin, often so closely connected with Celtic saga. An indication of the varied literature which has grown up about these legends would have been of general interest to scholars. As it stands, the introduction is devoted mainly to a detailed account of the different forms through which the collection has passed, and an investigation regarding the author's life. In this latter connection the editor gives very convincing reasons for the belief that John of Tynemouth filled the office of historiographer at the famous Abbey of St. Albans, in which capacity he composed his valuable 'Historia Aurea' (still unedited); and makes it probable, moreover, that he was a victim of the pestilence of 1348-49—a considerably earlier date for the death of this worthy than that which has been hitherto accepted. In the light of these investigations of Dr. Horstman, the article on John of Tynemouth in the 'Dictionary of National Biography' appears to be a tissue of errors.

The mixture of national with religious feeling which distinguishes this collection will, to people of English descent at least, give it an additional interest. Besides, the work in this new edition will be, doubtless for some time to come, the most generally accessible of the collections of the lives of saints in Latin—the language, of course, in which practically all of them were originally composed. We accordingly commend Dr. Horstman's publication to the attention not merely of students of hagiography, of whom it is to be presumed there are but few in this country, but to the wider circle of scholars in general who occupy themselves with mediæval life and literature.

The German and Swiss Settlements of Colonial Pennsylvania: A Study of the So-Called Pennsylvania Dutch. By Oscar Kuhns. Henry Holt & Co.

This is a painstaking presentation of the outward aspect of Pennsylvania German life. Made from the records and investigations of other writers, in the main, the picture is somewhat cold in color, and the reader misses that sympathetic interpretation of Pennsylvania-German kindliness, charity, hospitality, and integrity, in great and small matters, which the author, himself a Pennsylvania German, it might be thought would have been well qualified to give. He has, however, kept any racial sympathy which he may have felt with his subject well in hand. If this be a defect, it is largely compensated for by the exactness and care of the study. Still, our author occasionally trips up. After saying that the German Palatines who settled in New York, were often confused with their Dutch neighbors, in the note on page 216 he includes at least two Dutch surnames in a list of alleged German and Swiss families. An example of understatement is found on page 205, where we read: "Missionaries like Spangenberg and Post were of the utmost value in keeping the Indians quiet for many years, and many important embassies were intrusted to their care." The important services of Frederick Christian Post, the great Moravian peace-maker, who, in the French and Indian war, robbed the French of all their Indian allies on the Ohio, would scarcely be estimated at their real worth from so diffident a claim in his behalf. A sentence on page 226 would convey to the reader not acquainted with the facts that love for music was a new thing with the Pennsylvania German, whereas at Bethlehem a century ago choral societies and orchestras gave many public concerts each year, and introduced musical instruments and the music of the great composers of the Old World into the American colonies very many years before the cities of New York, Philadelphia, and Boston en-

joyed any such opportunities for musical culture. The extraordinary energy, initiative power, and executive capacity possessed by such a man as Dr. Brumbaugh, the present Commissioner of Education for Porto Rico, who within two years has done so much to Americanize fifty thousand Porto Rican children, and who is a pure Pennsylvania German, are qualities difficult to reconcile with the author's theory that the people of whom he writes are less strong than the Anglo-Saxons in these elements of character.

Many of the most interesting facts presented in this book are relegated from the body of the page to a footnote. In one such we learn that the wife of Lord Curzon, Viceroy of India, the late Gov. Russell of Massachusetts, Archibald Lampman, Bayard Taylor, Spencer F. Baird, and Judge Jeremiah S. Black were of Pennsylvania German stock; William D. Howells springs from the same race. Among the curious parallels to the mingling of English and German in the Pennsylvania-German dialect Mr. Kuhns cites such mirth-provoking phrases as "walke in le lane," "il dig up un clod del terre," and "l'owner del park vient al gate del park pur hunter," presented in the law French of England in the sixteenth century.

The Care of Books: An Essay on the Development of Libraries and their Fittings, from the Earliest Times to the End of the Eighteenth Century. By John Willis Clark, M.A., F.S.A. Cambridge (Eng.): University Press; New York: Macmillan. 1901.

The very earliest collections of books seem to have been connected with government and religion. At least the earliest of which we have any knowledge—those of Assyria—consist chiefly of public records, decrees, and devotional writings, and were naturally housed in the palaces and temples. So in Greece, and later in Rome, temples were favorite locations for public libraries, though, with the increase of wealth and luxury, private collections were made, often more for ostentation than use, so that, as Seneca tells us, a library had come to be as necessary a part of a rich man's house as a bath-room. Pope's Timon, showing his books to his visitors, calls attention to their "dated backs" and sumptuous binding; but his Roman prototype could not do this, as his books had neither backs nor binding. They were rolls of papyrus or parchment, the text being in short columns transverse to the length of the papyrus, which was rolled up by the left hand while it was unrolled by the right, and the title was written on a slip of parchment attached to the end. Such rolls were kept in pigeon-holes, like wall-paper at a modern paper-hanger's, where a sample of the pattern takes the place of the Roman *titulus*. After the *codex*, or leaved book, came into general use (considerably after the Christian era), presses or book-cases were employed, as in the Vatican Library, of which our author gives a copious and detailed account.

In the Middle Ages the great libraries grew up in the monasteries. Each monastery needed, of course, the books used in the service, the rule of the order, the Scriptures, and some treatises on theology; and around this nucleus a collection grew. The Benedictines especially favored the collection, production, and copying of books, and enacted minute rules for their care and use by the brethren. Other orders followed the example, and Mr. Clark has spared no labor in investigating their various regulations, which furnish very curious reading.

When these collections grew so large and their use by readers so extensive as to make a special library-room necessary, the old presses were found inconvenient, and hence grew the lectern system. The library was fitted up with reading-desks on which the books were laid, each book being usually fastened to a light chain running on a rod, to prevent abstraction or displacement. In front of each desk was a bench for the reader. A quite perfect example of a library of this kind still exists in Zutphen, Holland, with the old books still chained to the desks.

As books and readers multiplied, the lectern system was found unsatisfactory, and what Mr. Clark calls the "stall" system was introduced. The ends of the double lectern were carried up high enough to allow additional shelves above the desk, upon which the books stood upright, so that the reader, without moving from his place, could command a number of volumes. The next step was to discard the chains, which in public libraries was done in the eighteenth century. This allowed the removal of the reading-desk and doubled the space available for books.

All these systems contemplated the desks or shelves as set at right angles to the walls; but in the south of Europe the plan of setting the shelves against the walls was first introduced (Mr. Clark thinks) in the Escorial of Spain, in the sixteenth century. This plan was followed in the Ambrosian Library at Milan and the Mazarine Library in Paris, with the addition of a second story of shelves, accessible by a gallery. We have now reached the period of truly magnificent libraries, capable of containing tens and hundreds of thousands of volumes. The later devices for gaining additional space, such as those in use in the British Museum, do not fall within the limits of the work before us.

Not the least interesting part of this volume consists of information about early private libraries, and the use of books in connection with the private life of the Middle Ages, as exemplified by reproductions of old drawings and illuminations. The whole work is profusely and beautifully illustrated, and will delight the hearts of book-lovers.

A Japanese Miscellany. By Lafcadio Hearn. Boston: Little, Brown & Co.

Mr. Hearn's "honorable" offering—to talk in Japanese style—for this book year consists of six stories, or rather condensed novels; three chapters entitled "Folk-lore Gleanings"; and six light essays, to which he gives the name "Studies Here and There." His text is marked by the customary lushness of rhetoric that in flavor is rather French than English, while there seems no lack of sensitiveness to things visible and invisible in Japanese life. He catches upon his page the subtle tints and aromas of a life and civilization unique by reason of their island growth during a thousand or two years. Yet we ask whether it is not time to cease the endless and monotonous reiteration of the words "honorable," "august," etc., in expression of the idea conveyed by the Japanese prefix *o*, which certainly gives a false and exaggerated notion of the commonplaces of Japanese life. The North American Indians are much like their probable relatives, the Japanese, not only in having no simple term signifying "brother" (or sister), but instead "older brother" or "younger brother"; in using terms of address that always imply superiority or inferiority; in impersonality of speech; in weakness of pronoun terms; and in using prefixes and expressions which imply honor to the person addressed or to anything belonging to him, and more or less depreciation of self and what belongs to self. Yet it would seem absurd to render phrases, substantives, and the "hooks and eyes" of speech, whether Japanese or Iroquois, in what in English smacks of pomp and stilts. Especially in some of the studies of what is already nearly commonplace — studies which are of the lightest possible texture, even though decorated with abundance of felicitous phrase and grandiose diction—does this mannerism border on the absurd, while in metrical sentences it becomes ridiculous. For example, one of several hundred instances in the children's song (p. 177) runs (italics ours):

> "Under the willow-tree
> Sir Mandarin-duck
> Being shone upon by the morning sun,
> His *honorable* color is dark.
> If the *honorable* complexion be dark," etc.

The "stories" are as tiny crystals, evaporated out of enormous bulk of mother liquid. They open great windows into popular superstition. That "Of a Promise Kept" tells how, in order to make good his word, a man who has committed hara-kiri sends his ghost to report. The story "Of a Promise Broken" is of a man who vows to his dying wife that he will bury a bell with her in his garden, and not marry again. Yielding to his friends, he takes a new wife, who soon hears the bell ringing in the garden, and is finally dragged out, mangled and beheaded by the ghost of the first wife. Another is the story of prayers to the pest-god, who answers by taking the life of another person of the same name and transfusing the soul into the body of the sick girl; the convalescent becoming, according to a decree of the Court, the property of both households. Other stories are of the paintings of brutes and demons, done with such artistic genius that they turn to life. These are the commonplaces of folk-lore and art stories in "the artist nation."

Japan not only is called the Land of the Dragon-fly, but is extraordinarily rich in varieties of the insect itself. In "picture-poems," as the author calls them—mere jets of fancy fixed in words, the measured ejaculations that note a fact—the *tombo* flies before the mind's eye in many a dainty conceit. The statement of such fact, in its method, shows a tender sentiment and keen appreciation, both of color, the delicate veining of the dragon-fly's wings, and its grace and swiftness of movement. The chapter on Buddhist names of plants and animals shows how fully the faith and cult of India have become the basis of popular education and culture, touching the imagination and enriching the folk-lore. As Christianity in Europe, so Buddhism in Japan, has given a new outlook on nature

and a poetic vocabulary. For example, the Japanese name of the hammer-headed shark is *nembutsu-bo*, or the priest who chants prayers ("Namu Amida Butsu") — with a hammer and gong. Instead of a pulpit-pounder, the devout Japanese have a prayer-banger. The modern French name of shark, according to Littré, is, as Mr. Hearn recalls, only a corruption of "requiem," implying that for the man caught by a shark there was nothing to be done but to chant his requiem.

A long and rich chapter on the songs of Japanese children, including lullabys, shows how rich is this department of nursery lore. Among the "Studies," that of "The Case of O-Dai," a young girl, compels thought. At the command of "two English missionary women," she casts away the *ihai*, or ancestral tablets, and is soon exiled from society, and vanishes for ever, "flung into the furnace of a city's lust. . . . Perhaps she existed only to furnish one example of a fact that every foreign missionary ought to try to understand."

BOOKS OF THE WEEK.

Craig, W. J. The Works of Shakespeare: The Tragedy of King Lear. Indianapolis: The Bowen-Merrill Co.
Hardesty, Irving. Neurological Technique. Chicago: The University of Chicago Press.
Hunt, Gaillard. The Writings of James Madison, Vols. I., II., and V. G. P. Putnam's Sons.
Kidson, Robert. Town Ballads and Songs of Life. Published by the Author. 50 cents.

The Collected Poems of

WILLIAM WATSON

With Photogravure Portrait. 12mo. Price $2.50 net.

THE LONDON SPECTATOR: "Here is true gold of poetry—the 'authentic airs' of Parnassus. The chief, the dominant characteristic of Mr. Watson's poetry is felicity—and felicity not merely of word and phrase, but of thought. He is not only happy in language, but in the ideas which he presents and interprets."

Bryce's Studies in History and Jurisprudence
8vo, cloth, $3.50 net. Postage, 27 cents.
"It is no exaggeration to say that no man living is better qualified to write upon these and kindred topics than the author of the 'American Commonwealth.' The essays are all distinguished by that careful, painstaking research, profound learning, and scrupulous fairness and impartiality that have given Mr. Bryce's previous works such remarkable vogue among the learned and cultured of both hemispheres. The study entitled 'Hamilton and Tocqueville' will undoubtedly possess peculiar interest for American readers."

EXACTING INVESTOR!

My life has been devoted to the study of property values in Minneapolis. Am in a position to give you the benefit of expertness in placing investments where both security and fair percentage may be relied upon. An opportunity is solicited of presenting facts which investors everywhere ought to know about.

Theodore Wetmore & Co.,
MINNEAPOLIS, MINN.

Kansas City, Mo.

The present condition of Kansas City is exactly suitable for purchase of city property. Prices of to-day guarantee appreciable increase. There is no surer city in the United States for investors to make money in real estate. We have been identified with the real-estate interests of this city during its steadily healthy growth and would like to tell a few Eastern investors how others have made money here, and how any one with a reasonably unprejudiced mind can do the same.

Choice loans on hand for sale at 5 and 6 per cent. interest.

Our responsibility is unquestioned.

Thayer-Moore Brokerage Co.

AN OPPORTUNITY.

Would you consider an opportunity to secure *a permanent annual income* by investing your surplus capital in such sums as you might desire? If, moreover, you were afforded *perfect security* and the *assurance* of more than the average interest or dividends, would you invest?

If so, we simply ask you to investigate the proposition offered by the

Isthmus Plantation Association of Mexico.

Full particulars will be mailed you upon request, C. M. KENDALL, Gen'l Agent, 414-417 First National Bank Building, Milwaukee, Wis.

Travel.

Twelve Trains Daily Between New York and the South via Southern Railway.

The sunshine of popular favor has now settled upon the Southern Railway; they have made their system one of the great steel highways of the world.

The gratitude of tourists who appreciate the acme of luxury in railroad travel is due in no small measure to this system. Their line of operation is the great highway that leads to and through the Southern States. Year by year they have adopted every improvement that could add in any way to the comfort of that army of visitors who make their Winter home in the vast territory covered by its network of lines.

An example of the superb trains operated by the company is the "Southern's Palm Limited," which runs between New York and St. Augustine every day, except Sunday, during the Winter months. This magnificent train, the most luxurious in the world, runs through solid from New York to St. Augustine, excepting one drawing-room sleeping-car, which is detached at Blackville, S. C., and runs to Augusta, for the accommodation of travellers to this popular resort, and Aiken, S. C. The train is composed of Pullman compartment cars, drawing-room sleeping-cars, library, observation and dining-cars. Other fast daily limited trains are operated, carrying through Pullman drawing-room sleeping-cars to New York. Savannah, Jacksonville, Tampa, Charleston, Augusta, Asheville, Chattanooga, Nashville, Atlanta, Birmingham, Memphis, New Orleans, affording excellent service to Florida, Mexico, and the Pacific Coast. Dining-car service on all through trains. For further information call or address New York Offices, 271 and 1185 Broadway Alex. S. Thweatt, E. P. A., 1185 Broadway, New York.

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The School List in the *Nation* has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

THE NATION, 206 to 210 Broadway, New York.

THE MACMILLAN COMPANY, Publishers,

66 FIFTH AVENUE, NEW YORK

The Nation.

NEW YORK, THURSDAY, JANUARY 16, 1902.

The Week.

In the act of voting almost unanimously on Thursday for a Nicaraguan canal, the House made it altogether likely that the canal may really be constructed at Panama. All that was really signified by the passage of the bill was an overwhelming desire that an Isthmian canal be dug somewhere or other, and a renewed confession by the Representatives that they are not able or willing to legislate seriously, and that they prefer to leave everything to the Senate. In casting 102 votes, as against 170, for an amendment favoring the Panama route, the House gave the plainest kind of hint to Senators to go ahead and buy out the Panama Company, in the perfect assurance that the unterrified Hepburn and all the rest would meekly acquiesce. Indeed, Hepburn himself could advance no stronger argument for his bill than that the action of the House upon it could easily be reversed if the all-wise Senate so asked. The whole exhibition on the part of the House was melancholy, and even shocking. Openly to shirk responsibility, to rush like sheep to pass a bill which every man who voted for it must have known to be improperly drawn and to have no chance of becoming law, and without a blush of shame to call upon the Senate to do the work of the House—how could a great assembly stand more palpably self-condemned? Several Representatives, we are glad to say, were conscious of the humiliation involved in such shiftless legislation, and openly protested against the leadership which had brought the House to so insignificant a pass.

As for the terms of the Nicaragua bill itself, the admission of slovenliness could no further go. The bill is precisely the same (except for changing an 8 to a 4), down to the smallest word, as that passed by the House last May. All that has happened since then is completely ignored by the high and mighty Hepburn. The report of our own Canal Commissioners, to secure which Congress voted $1,000,000, simply does not exist for him. Take one item. The expert Canal Commissioners estimated the cost of a Nicaraguan canal, exclusive of the sum required for the right of way, at $189,000,000. The Hepburn bill provides that the total cost, right of way and all, shall not "exceed in the aggregate $180,000,000." He has thus quietly raised his estimate of last May by $40,000,000, but still professes to know more about it than any mere engineer who has studied the problem on the spot.

The speech made by Mr. Hepburn on January 7 on his Nicaraguan Canal Bill was disreputable in more than one particular. It contained the immoral suggestion that the canal, when built, should be free of tolls to American ships, meaning that there should be discrimination against foreign ships. This is in the teeth of the Hay-Pauncefote treaty, upon which the ink is scarcely dry, which declares that there shall be no discrimination whatever in the use of the canal for or against the ships of any nation. When Mr. Hepburn was pressed for an explanation of his words on this point, he said he hoped that Great Britain would give consent to discrimination in favor of our ships, although he must have known that the whole aim of British diplomacy (and of our own, too), until this time, has been diametrically opposed to discrimination in tolls. Mr. Hepburn said that our war-ships would go through free of toll anyway—a statement that can be true only in the sense that, as we are to build and own the canal, the tolls will be taken out of one pocket and put into the other. Under the treaty there is no more chance of discrimination in tolls on war-ships than on merchant ships.

It is disreputable in another sense that Mr. Hepburn seems not to have read the report of our Isthmian Canal Commission. In a colloquy with Mr. Reeves of Illinois he said that, inasmuch as the Panama Company had no right to sell out to the United States without the consent of the Colombian Government, it had forfeited its concession; and Mr. Reeves apparently assented to that view. Yet on pages 219 and 220 of the Commission's report there is a letter from Admiral Walker to M. Hutin acknowledging receipt of certain correspondence between the latter and Señor Silva, the Colombian Minister at Washington, showing that the Colombian Government had authorized him (Hutin) to enter into negotiations with the purpose of selling the Panama Canal to the Government of the United States. This statement, which was published in the newspapers months ago, cannot be questioned or ignored without disputing either the genuineness of the letters or the authority of the Colombian Minister to commit his Government. As no such question was raised by Mr. Hepburn, the natural inference is that he has not read the report of the Commission. It seems, however, that one Congressman who took part in the debate, Mr. Mann of Illinois, had actually familiarized himself with the contents of the report, for he said that he did not agree with Mr. Hepburn that the Panama Company had forfeited its rights by offering to sell its concession to the United States. Mr. Mann also, while favoring Mr. Hepburn's bill, dashed the hopes of the latter in reference to discrimination in tolls, by pointing to the clause in the new treaty which forbids it—a very simple but very necessary reminder to the Chairman of the House committee having charge of this important matter.

The new Ship-Subsidy Bill which has been introduced by Senator Frye, is made up of two entirely distinct parts, the first relating to mail subsidy, and the second to general subsidy. These not only are kept entirely distinct in the provisions of the act, but rest on entirely different principles. The mail subsidy, if justifiable, can be given only on the basis of value received by the Government in the carrying of the mails. If the Government does not receive value for what it pays, the system has no justification, and the payment must be regarded as a mere bonus. It is not difficult in this case to pass on the question of value received. The present bill, so far as it relates to mail subsidies, merely amends the Postal Subsidy Act of 1891 by increasing the compensation to vessels and altering their classification. The Act of 1891 was preëminently in the interest of the American Line, and the amendment now before Congress, by means of that concealment of special gifts under technical provisions which was such a feature of the former subsidy bill, is still more directly a gift to that line. The limit of the tonnage of the vessels of the first class which are to receive the highest subsidy, has been apparently so fixed as to exclude every American vessel afloat except the four ships of the American Line. During the last fiscal year of the Post-Office Department, the American Line carried about 71,000,000 grams of letters and 641,000,000 grams of printed matter, for which the Government, under the Act of 1891, paid it $528,536. During the same year the Cunard Line carried almost twice this weight of letters (137,000,000 grams) and 835,000,000 grams of printed matter, but received for the service only $213,103; and the White Star Line, which carried about 62,000,000 grams of letters and 326,000,000 grams of printed matter, received but $91,591. That is, the Government is now paying to the American Line for an irregular service a rate about three times higher than it pays for service by other lines carrying the same mails, and this on a theory of "value received."

Congressman McCall has introduced a bill to restore the provisions of the McKinley tariff relating to personal bag-

gage, and to remove the $100 limit. We do not see any sound objection to such a return to a civilized method of treating Americans coming home from Europe. It would cease to make our customs laws a laughing-stock to foreigners, and a source of humiliation and often actual danger to our own citizens so unfortunate as to desire, or to be compelled, to travel abroad. We know it is said that the present barbarous law is necessary in order to head off the operations of swindling tailors and smuggling milliners, who would otherwise bring in dozens of trunks full of garments for their customers, under the guise of "personal baggage." To all such cheating we are, of course, as much opposed as any one, but there is reason in all things. What is the secret service for, why do special agents of the Treasury exist, except to unearth and run down such frauds on the revenue? We read all the while of the arrest of diamond-smugglers, and we are sure that the suave milliners and the slippery tailors could be caught in the same way. Why should a whole nation be forced to suffer for their sins? We have no objection whatever to seeing Paris-made gowns and London-made suits dragged from the trunks of smugglers and made to pay the duty which the law provides; but why force 200,000 American travellers to suffer in purse, in feelings, often in health, and always in patriotic pride, merely in order to catch a few tricky milliners and defrauding tailors?

The President's readiness to hear the appeal of Rear-Admiral Schley from the findings of the Court of Inquiry should reassure people who have believed in the existence of a gigantic conspiracy against this officer. In ordinary court-martial cases, in both the army and the navy, where the sentence does not involve dismissal from the service, the President is not expected to pass upon the findings, although he has the right to do so. The same is true as to courts of inquiry. In both cases, however, the etiquette and discipline of the service demand that the papers shall come up to the Commander-in-Chief through the regular official channels—in this case through the Secretary of the Navy. The President's action in the matter is final. Only in rare instances has Congress set aside the action of a court-martial which has received Executive approval, by restoring a dismissed officer to active service. President Roosevelt's action will, it is to be hoped, finally end the matter, and will prevent the Schley adherents from claiming that any tribunal has been closed to them. There is no reason to believe, however, that the President will reverse the findings of the entire court in regard to Schley's negligence, disobedience of orders, and evident incapacity for his high position, while there is good ground for accepting the press statements that he will veto any bill to exonerate or promote a man who has been so overwhelmingly condemned by three of his fellow flag-officers.

Close upon the warning of the London *Times* concerning the probable inadequacy of our bank currency at a future period of stringency, comes the news from the Treasury that the volume of notes outstanding is decreasing as rapidly as the law will permit. The maximum rate of decrease now allowed by the National Bank Act is $3,000,000 per month, and this limit has been reached for December and January, while further applications for more than another month in advance have been filed. At this rate, a large part of the increase in bank circulation under the law of March 14, 1900, will have been offset by corresponding withdrawals before the end of next September. The usual autumnal demand for currency with which to move the crops will then be felt in its full strength, just as the circulation has lost much of its recent gain in volume. This situation is far more serious than appears on the surface. Large numbers of new banks have been organized under the law of 1900, and, should the circulation fall to its old level, the decline will mean that the conditions of note-issue are even less attractive to-day than they were under the unmodified bank act. A strong demand by the lately organized banks for the recently issued bonds, in order to make their necessary deposit, and the present strength of the Treasury, are undoubtedly responsible for the unexpectedly high price of the 2 per cent. bonds, and the consequent unwillingness of banks to invest more largely in Government securities than they are compelled to do. This is merely a repetition of the too familiar experience with our bank currency. When stringency arrives, and the delays at Washington make it impossible to get notes in time to give relief, we shall probably awaken from our satisfaction with present currency conditions. Why not act now upon some one of the plans so often suggested to Congress, before the difficulty becomes acute?

The prevention by arbitration of two threatened strikes indicates that the year is opening with omens favorable to industrial peace. Strikes averted by arbitration naturally make less noise than those which actually occur, but it was none the less a real service that was rendered by the Arbitration Committee of the National Civic Federation in composing the differences between the Clothing Manufacturers' Association and its employees. Had it not been for the work of a sub-committee which met representatives both of the employers and of the men, a strike involving from 40,000 to 55,000 garment-workers would probably have ensued. On a smaller scale, but quite as interesting, is the outcome of the dispute between a Brooklyn shoe-manufacturing firm and its employees. Mr. Stark, State Mediator of Industrial Disputes, who was lately chosen as the fifth member of a committee intrusted with the decision of the question at issue, has given his verdict in favor of the employers. While the Civic Federation Committee has had to depend solely upon its own tact, and the sense of fairness among those to whom it appealed, the decision of Mr. Stark is supported by a forfeit of $10,000, agreed upon by both parties to the dispute in the Brooklyn shoe factory. The difference in the character of the two decisions is, perhaps, due to these differing conditions of arbitration. The Civic Federation Committee made concessions to both disputants. Mr. Stark gave his verdict unequivocally for the employer. A definite decision is much more likely to be rendered when the judge feels that he has final power in his own hands than when he must negotiate in order to secure its acceptance.

The most important question in the railway world to-day is the one on which Mr. James J. Hill addressed a convention of farmers and stock-growers at Fargo, N. D., on Friday. His speech was a defence of the combination recently formed for merging the Great Northern, the Northern Pacific, and the Burlington systems into one corporation, the Northern Securities Company. It was a very strong argument, if not wholly conclusive, and had a considerable effect upon an audience whose prejudices ran pretty strongly the other way. Mr. Hill asked the question whether the people of Minnesota and the Dakotas would have objected to the building of the Burlington lines by the Great Northern and the Northern Pacific Companies, if the Burlington Company itself had never existed, and if its territory were unoccupied. If not, then why should they object to the purchase of those lines when already built? A critic might answer that the first question at issue relates to the merger of the two Northern lines, before the Burlington comes into the field of contention at all, and that the second question relates to the amount of securities issued for the Burlington, which are virtually a fixed charge upon the whole combination. As these questions are soon to come before the courts, we shall not discuss them, but merely point them out as elements of the problem. It is quite true that the Northern Securities Company is not the first of its kind in the United States. The Pennsylvania Company, which was formed to bring and hold together the Pennsylvania Railroad and its Western connections, has existed for a quarter of a century without adverse comment, and it is reported now that it has embraced the

Baltimore and Ohio within its ample folds.

Mr. Belmont's failure to carry the election in the Seventh District, and, incidentally, to supply the Democracy with the intellectual and moral leadership which it sorely needs, irresistibly recalls that magnificent tribute of the negro orator to the retiring Governor of South Carolina, in the old carpet-bag days. "He reached the Governor's chair," said the eloquent toastmaster, "in the face of great opposition; he leaves it with none at all." So of Mr. Belmont it may be said that his nomination was one of the most bitterly contested ever known, but that his defeat has been received with universal acquiescence and even cheerfulness. His campaign was one long series of unfortunate misunderstandings. The candidate misunderstood Croker, and Croker misunderstood him; he failed to develop elective affinities with Murphy, and could not, do what he would, put himself *en rapport* with Battery Dan Finn. The crowning misunderstanding was with the voters of the district, and this was so colossal that it turned Muller's Democratic majority of 4,332 in 1900 into a plurality against Belmont of 394. There must be a moral of some kind in such figures, and, for our part, we think it is an artistic one. It will be observed that Mr. Belmont was slaughtered in the house of his friend, the art connoisseur, the Hon. "Nick" Muller. Richmond County alone made an overturn of more than 2,300 votes. This, in our judgment, was due to the low views of art that Mr. Belmont stood for in the eyes of the Staten Island voters. He thought he could palm off upon them a rubbishy painting, given to Muller purely in the way of friendship, worth only $200, and the work of an artist so insignificant that he could not even recall his name. If it had been a Corot or a Diaz, the result, we are firmly convinced, would have been different. It is necessary to raise art, hand in hand with politics, to a "higher plane."

The annual banquet of the Institute of Electrical Engineers on Monday evening was a testimonial of the profession to Signor Marconi. It expressed their appreciation of his wonderful achievements in sending electrical signals across the Atlantic Ocean by the wireless system. Hitherto there has been doubt in the public mind whether this achievement was well authenticated or not, since the experimenter himself had not published any statement of the facts signed with his own name. His speech in the presence of such men as Alexander Graham Bell, Elihu Thompson, and Professor Pupin, and the approving letters of Mr. Edison and Mr. Tesla, will convince everybody that the reports sent out from St. Johns, a few weeks ago, were true. But this is not all. The public are now prepared to accept more than has heretofore been claimed by the inventor. He now says that he has devised a method by which the messages sent by the wireless system can be kept secret. This is accomplished by attuning the sender and the receiver so that the latter will respond only to a particular note. This is not a new conception. It was brought out and exhibited by Elisha Gray by wire transmission in 1876. Of course, nobody then suspected that the same effects could be produced by aerial transmission. The commercial consequences of Signor Marconi's discoveries cannot now be estimated, but they are likely to be of the highest importance.

There is every reason to anticipate that the Government of Newfoundland will oppose the renewal of the *modus vivendi* concerning the French shore. The renewal of this temporary arrangement for the year 1901 was regarded as a great concession to the home Government, and was made only in consideration of the difficulties of the general foreign situation which confronted the Salisbury Ministry. It is doubtful if the Provincial Government will listen again to such an appeal. It is hard to see how Mr. Chamberlain can refuse to move in this matter. As things now stand, the Newfoundlanders have the grievance of being shut off from about 800 miles of their own coast, and suffer the humiliation of seeing what is virtually foreign sovereignty exercised in various exasperating forms on their own territory. It has been interestingly shown by Mr. P. T. McGrath in the *North American Review* for January that the French claim of an exclusive concession on the west coast exceeds the stipulations of the treaty of Utrecht; that the right to fish and use the coast for purposes incidental to the fisheries is concurrent, and not exclusive; and that America, by the convention of 1818, acquired equal rights on this coast with France and Newfoundland.

The probably unique spectacle of a Prime Minister publicly rebuking a Minister of a friendly Power was witnessed on January 8 in the Reichstag. To be sure, Count von Bülow, when he spoke of unfriendly criticism of the German army, did not mention Mr. Joseph Chamberlain. It was clear enough, however, that, when he dwelt on the impropriety of justifying an unpopular policy by adducing foreign examples, he had in mind the speech in which Mr. Chamberlain paralleled the British policy in South Africa with the German campaign against the *francs-tireurs* in 1871. These pot-and-kettle comparisons, the German Premier felt, were peculiarly odious when made between nations which have had guerrilla wars on their hands. Now it should be said that in this very courteous rebuke Count von Bülow was far from following his own counsel of "leaving foreign countries out of the discussion"; for a rebuke, it was quite as explicit as if Mr. Chamberlain had stood in sackcloth and ashes before the Reichstag. From this introduction into German parliamentary procedure of the methods of debate most thoroughly exemplified in our own Senate, Lord Rosebery should draw a text for his next academic discourse "On a Certain Acerbity in the Colonial Secretary."

Whatever may be the effect of the spectacular return of the Imperial Court to Peking, there is little doubt that that city will remember the autumn of 1900 as the Romans still remember the spring of 1527, when the troops of the Constable Bourbon sacked the town. That the effect of the foreign occupation and of the numerous punitive expeditions was exemplary, even upon the populace of Peking, should not be assumed too lightly. The Chinese of Pechili have certainly learned to fear the foreigner, but it is by no means certain that they are not waiting their chance for revenge. One must remember, too, that the great mass of the subjects of the Emperor will never so much as learn of the humiliation of the court, of the ceremonious apologies, and of the heads of Ministers offered to the envoys of the Powers—or, if they learn of these at all, will hear some official version which bears the color of a triumph over the "foreign devil." We are likely to forget how insignificant a fact the sacking of the Imperial City is to the other provinces of China. We Americans probably feel quite as keenly the almost forgotten burning of Washington in the war of 1812. One must recognize, then, that if there has come about any real reform in Chinese conditions, it has not been through any change in the attitude of the people toward the foreigner, but through some change in the character of the court and of the viceroys. We know that for the moment the court has been reorganized upon the basis of friendliness to the foreigner. What we do not know is how sincere this attitude is, and it is certain that no more in China than elsewhere is it grateful to kiss the hand that smites. If the Empress Dowager and the Emperor really fear the foreigner, we may suppose that they will put down relentlessly the anti-foreign societies which, as things go in China, will always be a possible cause of disturbance. But it is quite as likely that the court feels that the return is virtually a triumph; that the sojourn at Singan, the ancient capital, proved that the Powers, Russia excepted, can do no more than touch the empire at its borders. It should be remembered, too, that the court returns in its own time, and, on the whole, upon its own terms.

THE TREASURY SURPLUS.

The menace to business interests consequent upon the withdrawal of money from the banks into the Treasury, in excess of the Government's disbursements, has been the subject of standing comment in the newspapers for a generation, and at times of angry criticism and objurgation against the statesmen at the head of the Treasury Department. Various plans have been devised for securing the automatic, or at least the regular, return of the surplus funds of the Government to business channels. A bill to accomplish this end, which was introduced in the House last week by Congressman Sulzer of New York, merits attention. According to our recollection, this plan was first suggested by Secretary Gage in a public address, but he has never seen fit to embody it in an official report as a formal recommendation to Congress. He may have apprehended the censure of the smaller banks of the country if he should suggest any plan that would omit them from the list of depositories of the public funds, whereas Congressman Sulzer is exposed to no such animadversion. We understand that the essential features of this measure will be embodied in a more comprehensive measure, to be adopted by the House Committee on Banking and Currency, and to be reported for consideration during the present session. Accordingly, we shall offer some reasons why the principles embodied in it should be favorably received by Congress.

The measure proposes that the Secretary of the Treasury be directed to deposit all surplus funds belonging to the United States Government with national banks having a capital of not less than $500,000 and a surplus of not less than $500,000—such deposits to be made without requiring United States Government bonds as security; that on such deposits the United States Treasury shall receive interest at the rate of 2 per cent. per annum; that such deposits shall be a first lien on the assets of the bank; and that no deposits in any one bank shall be greater than the combined capital and surplus of such bank. The plan as originally suggested by Secretary Gage provided that the deposits should be made in the banks of the central reserve cities, New York, Chicago, and St. Louis. This restriction would spare the Treasury some trouble in the handling of the funds, but it would probably be impracticable to secure the adoption by Congress of any plan which should draw a line against such cities as Boston, Philadelphia, Baltimore, and New Orleans, and exclude their banks from participation in the deposits.

The present methods of restoring the surplus funds of the Treasury to the money market depend upon the abundance of Government bonds in the market and the price at which they can be bought. If the Secretary decides to use his surplus in buying the bonds outright, he lessens the total amount outstanding, and increases the difficulty of his next operation. If he decides to deposit his surplus in national banks, he must have Government bonds as security therefor. This is a requirement of law, and he has no discretion to take anything else. The law was passed nearly forty years ago, when the supply of Government bonds was abundant and increasing and the price was correspondingly low. Opposite conditions prevail at present. The bonds are scarce, the price is high, the demand for private and trust investment is increasing as the supply diminishes.

The proposed measure would look to a first lien on assets of the banks for security of the deposits, and, instead of exacting Government bonds as a pledge, would require the payment of interest for the money deposited. A calculation has been made by the statistical department of the Treasury, showing that, if the law regulating Government deposits in the banks had been such originally, not only would there have been no loss, but there would have been a gain of $32,000,000 in the way of interest. This ought to be a decisive argument in favor of the change. It may be argued that it would be unfair to the regular customers of the banks to give to one depositor (the Government) a superior lien on the assets in case of failure. That feature, however, exists in the present law. The deposited bonds are a part of the assets of the depository banks. They are the choicest assets, and upon these the Government has the first lien. If they should decline in value, there is another provision of law which gives the Government a first lien on the remaining assets.

The practical question is not whether the security of the proposed plan is exactly equal to that of the existing system, but whether it is sufficient to protect the Treasury. We think there can be no doubt on this point. By restricting the deposits to banks which have capital and surplus equal to $1,000,000, by limiting the amount of deposits in any particular bank to the measure of such capital and surplus, and by leaving to the Secretary a discretion in the choice of the depositories, so that he may exclude any bank which rests under his suspicion, it really seems as though any doubt were mere cavilling, especially when we consider that the Governments of the Old World deposit all their collections in banks without any special security whatever.

A SECRETARY OF COMMERCE.

The presumption is always against the establishment of a new office. It must prove its right to exist. To this rule of sound politics the proposal of an additional branch of executive government, to be known as the Department of Commerce, is no exception. The country should not demand or approve it, nor should Congress vote it, if it is intended simply to provide a parcel of unoccupied patriots with pleasant sinecures. It is doomed in advance if it contemplates merely the erection of what Burke's sarcasm, directed against the reconstructed Board of Trade, described as "a sort of gently ripening hot-house, where eight members of Parliament receive salaries of a thousand a year, in order to mature at a proper occasion to a claim for two thousand."

President Roosevelt urged in his message the creation of a Secretary of Commerce. His recommendation has received the endorsement of many merchants and manufacturers, and on Thursday the bill introduced by Senator Nelson to establish the new department was favorably reported by the Committee on Commerce. It provides that "it shall be the province and duty of said department to foster, promote, and develop the foreign and domestic commerce, the mining, manufacturing, shipping, and fishery industries, the labor interests, and the transportation facilities of the United States." Here is certainly a vast field of activity. The President's language was even broader; the new department, he declared, should be but one phase of "a comprehensive and far-reaching scheme of constructive statesmanship, for the purpose of broadening our markets, securing our business interests on a safe basis, and making firm our new position in the international industrial world." In a recent article, Mr. A. B. Hepburn urges that "the time has arrived when Congress should broaden its policy, and aid our people in commanding the markets of the world." "How better can this be done," he asks, "than by creating a Department of Commerce and Industries, charged with the supervision and promotion of commerce and trade?"

It is not easy to see precisely how a Secretary of Commerce could succeed in conquering the markets of the world when confronted by a Congress which resolutely refuses to make the slightest concessions to foreign countries. Neither is it possible that, under our system of government, he should ever possess the powers of the "foreign section" of the Ministries of Commerce in Continental countries, which is charged with the preparation of tariffs and customs legislation, the enforcement of maximum or minimum rates, and the negotiation of treaties of commerce and navigation. It is, however, entirely possible that a Department of Commerce should wield an enormous influence in domestic industry. The present drift of public opinion suggests that it might be made the agency for exerting the authority to regulate interstate commerce. It is easy to conceive of a Secretary who should have

somewhat the same relation to the business interests of the country as that held by the Comptroller of the Currency towards the banks. If the bill now pending and designed to secure publicity in the accounts of corporations should be passed, the new Secretary might be vested with the power both of ascertaining and publishing the facts of domestic business. It was some such idea as this which led Mr. Dill, in his recent address at Chicago, to say, "No man in the United States, not barring the President, will exercise such a potent influence over the future life of this country as the Secretary of the Department of Commerce."

That any man will be endowed by Congress with such powers as these, or that his functions will be permitted to expand along the lines suggested by Mr. Dill, is, to say the least, highly unlikely. About all that can be expected of the new department is that it shall faithfully conduct the work now done by scattered bureaus, like the Life-Saving Service and the Bureau of Navigation in the Treasury Department, the Census and Patent Offices in the Interior, and the Foreign Commerce Bureau of the State Department, and others, which are to be brought together. To these is to be added a Bureau of Manufactures. The Department would thus serve the same purpose as the British Board of Trade. That body at present consists of six offices. One deals with commercial statistics, one with the inspection of railways, general oversight of their rates, and the granting of patents, and one with marine matters, including the examination of seamen and the inspection of ships. A harbor bureau is intrusted with lighthouse and quarantine control, a financial office has charge of life insurance and bankruptcy matters, and another section deals with all questions involving sea fisheries.

As a measure intended mainly to relieve the existing departments of irrelevant work, Senator Nelson's bill commends itself as business-like. The Treasury would be stronger if it could be freed from the necessity of performing multifarious unrelated duties, and could confine its attention strictly to its financial operations. The same may be said of the other departments affected, for the bureaus they would surrender are such only as do not accord with their general scope, and have been assumed from time to time under stress of circumstances. On the other hand, the various offices and services united under the Secretary of Commerce could doubtless be made to work together in far greater harmony than now. Uniformity in our Government publications and in our commercial statistics would alone be a vast gain. Beyond such a practical, every-day end there seems at present little reason to expect much. Yet we recognize the fact that a man of broad views and energy might make of the new Secretaryship, if he were so minded, a powerful agency for imbuing the nation with those enlightened conceptions of foreign commerce upon which it must act if it is to rise to the height of its great opportunity.

CURRENCY REFORM IN THE PHILIPPINES.

Recent dispatches from Manila, disclosing the currency confusion which is vexing the merchants in that city, should call fresh attention to the report of Mr. Charles A. Conant, Special Commissioner of the War Department, which has recently been published. The difficulties lately experienced by the Philippine Commission in maintaining the artificial rate of exchange between American gold and Mexican silver ought to result in concentrating attention upon the settlement of the Philippine monetary question. The Commission itself recommended a plan to attain this end nearly a year ago, but no action was taken. Its suggestions, however, are vividly recalled in Mr. Conant's report. Of the four methods proposed for dealing with the monetary question, he agrees with the Commission in selecting that which provides for the adoption of a gold standard, with a legal-tender silver coin, known as the "peso," of limited coinage, containing twenty-five grams of silver, and exchangeable for 50 cents in American gold. The question, after all, involves no large matters of theory, but is mainly one of detail. That the special circumstances of the case admit of a transition to the gold standard, the opinion of the Philippine Commission sufficiently attests, and that such a step will be beneficial is fully established by Mr. Conant's investigation.

The solution of the Philippine banking question, if we were to stay in the islands, would not be so easy. In dealing with it Mr. Conant has had to break fresh ground. According to him, the principal needs of the islands are two —better banking facilities, including mortgage banks, and a suitable note-currency. Some means of making agricultural loans is an immediate necessity. The present methods of cultivation are antiquated, and capital is needed in order that more modern modes of production may be introduced, and good seed, draught animals, and tools provided. Some idea of the difficulties under which the Filipino farmer now labors may be gathered from the single fact that the interest charged on farm loans by small money-lenders is from 25 to 40 per cent.

The need of a flexible bank currency is experienced with peculiar force in the Philippines. At present the people have no paper currency except the notes of the Spanish-Filipino Bank, which are of small and decreasing volume, and such paper currency as may come to the islands in the pockets of visitors. How extensively paper would be employed if suitable agencies for issuing it should be supplied, may be seen from a comparison with the situation in Hong Kong, where, notwithstanding the large supply of Mexican silver in circulation, not less than 10,000,000 pesos in notes are in daily use.

Mr. Conant thinks that a certain guarantee of permanence in policy might be afforded by Congressional rules for the government of mortgage banks. The several institutions should have capitals of not less than $250,000, their loans on real estate should be limited, they should lend not more than 10 per cent. of their resources to any one person, and they should be subject to visitation and inspection. When he comes to take up the issue of bank currency, his report is much more radical in character. Mr. Conant proposes that the notes shall be issued by branches of our own national banks, under bond-deposit requirements much less rigid in character than those now in force. Of course all the usual reasons for recommending branch banks hold good for the Philippines. But there are two considerations which have special force there. In the first place, the issue of notes could not safely be intrusted to small independent institutions. Further, it is not to be expected that national banks of large capital will be established at Manila, for the restrictions under which they do business would not permit them to find a profitable field. If the notes are to be issued by national banks at all, therefore, they must be issued by branches of institutions in the United States. Mr. Conant recommends that the power be granted to national banks, established either in the Philippines or in the United States, to establish branches, both here and throughout the islands. He provides, however, that branches established in the United States shall be prohibited from discounting commercial bills and from making advances upon securities, when such transactions are carried on within the United States. Such restrictions would make branches in this country little more than agencies for conducting a foreign exchange business.

The system suggested for the issue of notes is a variant of the plans so often proposed in this country during recent years. Mr. Conant would have the notes issued only by banks with capitals of at least $500,000. Such institutions would be required to deposit the minimum $50,000 in bonds which is now required of national banks with capitals of $200,000 or more. Their notes would be made a first lien upon all the assets of the issuing bank, as well as upon the $50,000 of bonds, and would be limited in amount to 50 per cent. of the paid-up capital of the issuing bank. To make assurance trebly sure, a guarantee fund for the redemption of notes of failed

banks should be established by a tax of ½ of 1 per cent. upon the circulation actually outstanding.

Whatever be done about establishing a system of banks in the Philippines, it is necessary to determine the status of the institutions which already exist there. These are at present principally controlled by three banks, two of which are owned in England and have branches in the islands, as well as elsewhere. The third is the Spanish-Filipino Bank in Manila. It claims by Spanish charter the exclusive privilege of note-issue until 1928. Its circulation is now about 2,100,000 pesos, though it is being gradually reduced. Its directors are willing to comply with proper regulations for the conduct of business. For these reasons, Mr. Conant recommends that this institution be permitted to maintain its note-issue on the conditions proposed for our own national banks, except that its circulation shall be allowed to expand to 100 per cent. of its capital instead of 50 per cent.

Mr. Conant's recommendations are unquestionably sound, though whether Congress can be induced to follow them is another question. We see no reason why those which relate to the introduction of the gold standard should not be adopted without delay.

THE CARNEGIE INSTITUTION.

It is plain that the Carnegie Institution is to be not a university, but an auxiliary to all the universities of the land. Its aim will be to initiate and foster pure research, leaving the investigator free to pursue his studies wherever his duties or his convenience may dictate. Assurance is given that all branches of scholarship will be impartially considered, that natural science will have no preference over the humanities, but that both will be recognized according to the ability and promise shown by their devotees. This great institution will, presumably, erect no stately pile of buildings, confer no high-sounding degrees, build up no imposing list of famous teachers to form its visible faculty. It will, on the contrary, aid in the search for truth only those who have passed the pupil's stage and are fit, themselves, to lead others in research. The greatness and generosity of the thought which prompts such a foundation will never find adequate material expression. Hundreds of investigators, each following the line of his preference and capacity, each adding to the stock of human knowledge, each measurably relieved of the hard material conditions which are almost inevitably the scholar's lot—this will be the Carnegie Institution in effective operation. The spectacle is only for the mind's eye, but it yields nothing in impressiveness to crowded lecture-rooms in stately buildings, and all the visible pomp and circumstance of university life.

Such, so far as one may gather from the brief and somewhat arid expression of intention given to the press as yet, is the ideal of the Carnegie Institution. To make it effective is a task of far greater delicacy and difficulty than that which confronts the administrator of a university. The university has its students under constant observation, while its professors are habitually under the stimulus of friendly association and professional rivalry. The Carnegie Institution will require a peculiar tact of its administrators—nothing less, indeed, than the ability to discern the promise of investigators who have only begun to display their quality, and the insight and diligence to select from the thousands of professed investigators in the country the scores or the hundreds who are worthy of the extraordinary support and encouragement offered by this unique institution.

That the distinguished scholars, statesmen, administrators, and men of affairs who make up the Board of Trustees fully realize the gravity of this problem may be unhesitatingly assumed. The public, however, may not so fully recognize the fact that the practical efficiency of the foundation will depend upon sub-committees of eminent specialists which must make the actual awards of fellowships, prizes, and subsidies. The Board of Trustees could not, if it would, examine the individual applications, or fairly weigh the credentials of aspirants in the remoter fields of scholarship. If, for example, a Western scholar or group of scholars should request support for a concordance of the major Buddhist writings—a desideratum in the Oriental field—it is certain that the Board of Trustees would lay the matter before the recognized leaders of Oriental study in this country. It may fairly be assumed, then, that, corresponding to the faculty of an ordinary university, the trustees of the Carnegie Institution will gradually appoint standing committees of noted specialists, to which the duty of actually choosing the beneficiaries and administering the subsidies for research will be intrusted. Such committees, it is almost needless to say, should be of the highest professional character. The appointment of a few advisers on the basis of academic notoriety, rather than of scholarship, would mean the cheapening of Mr. Carnegie's benefaction, so far as these scholars, falsely so called, had it in charge. It would be possible, indeed, through favoritism, or even through mere frivolity, largely to vitiate the usefulness of Mr. Carnegie's gift. His trustees cannot be too much on their guard against specious adventurers who sail under the colors of scholarship. While one might regret in passing that the officers of our older universities are not more largely represented on the Board, fortunately its composition gives every assurance that its members will not appoint to these vital positions on the advisory committees men unworthy of so great a trust.

The distinction of the Carnegie Institution over similar foundations lies chiefly in the power to initiate disinterested research. Other institutions—the academies, for example, both here and abroad—reward research successfully completed. The very useful work of publication and distribution of learned works is already undertaken by bodies like the various academies—the Smithsonian Institution, notably—and the university presses. Beyond these useful and dignified functions, the advisory committees of the Washington foundation will have the privilege of surveying minutely their respective fields, and deciding where lies the most pressing need and the greatest promise, with the assurance that no scholarly enterprise once advisedly undertaken will be cramped or deformed for lack of financial support. It would be foolish to forecast minutely the course of an institution which is so auspiciously founded and organized, but one may venture the prediction that a series of great co-operative investigations in the field of science, philosophy, letters, and art will be the most enduring monument of this "invisible university," as they seem to be its most logical reason for being.

POPULAR APPRECIATION OF SCIENTISTS.

Something of the mediæval notion of science as a variant of the black art seems to survive in certain popular modes of speaking of modern scientists. Marconi is a "magician"; Edison, a "wizard." Nor are these phrases purely chance-sown. They well express the real mental attitude of millions of honest folk towards science. To them it remains a region of wonder and mystery. Any miracle may come out of it any day. Tesla's fevered dreams are as credible as Marconi's sober and guarded forecasts. To one in this state of mind the scientist necessarily appears akin to the medicine-man. He is the thaumaturge of to-day. The multitude thinks of him as a being of quasi-supernal and romantic powers. This is, as we say, a distinct survival of the ancient conception of science, as it is figured for us by De Maistre under the image of a sort of Sibyl, with an unearthly air of the supernatural about her. There is in all this little resemblance to Huxley's definition of science as simply "organized and trained common sense."

It must be confessed, too, that the popular fondness is for the spectacular side of science. Its marvels, its theatric displays, its visible revolutions obviously wrought, are the only real triumphs of science in the judgment of the

general. A name must have the luck to be hitched to some great discovery affecting every-day life if it is to be sure of a tablet in the impromptu hall of fame erected by the press and by the public which gets its ideas from the press alone. Of the true spirit of science, of the joys and ardors of its pursuit in silence and obscurity, there is not the pervasive appreciation which some rash praisers of the age assert. A bread-and-butter science, a kind of Caliban chained to useful offices, is held in sufficient and widespread admiration; but for scientific method as such, for the scientific worker who does not happen to emerge from his laboratory with a miracle in each hand, there is not the common and intelligent enthusiasm depicted in orations on modern progress. Even a great scientist and great benefactor of humanity in one, like Behring, may remain practically unknown and unhonored by the commonalty. It took the bestowal of the Nobel prize for science upon the discoverer of the anti-toxin treatment for diphtheria, to remind most people of so much as the name of one of the most rigorous scientists and triumphant students that ever lived.

At the same time, it is true, we believe, that there never was so general an impulse to pay honor to science, and do homage to the scientist, as exists at the present time. It is a part of our proud consciousness of superiority over the past. The advances which civilization has made are perceived to be largely the work of science, pure and applied, and we feel that we are but paying a just debt in exhibiting our delight to honor, even if somewhat unintelligently, the typical figures among our scientists. This was perhaps the most striking thing about the celebration in connection with Berthelot, the other day. All France was there represented, official and learned, and the ceremonies almost took on the character of a national fête. Yet the Minister of Public Instruction was obliged to confess, in his speech of felicitation, that he should have to leave it to others to say exactly what was Berthelot's title to scientific distinction. Indeed, to the outside public, the recondite researches of the great chemist must have been wholly caviare. He had not even had the good fortune, like Pasteur, to attach his name as a tag to processes of food-preservation or to treatment of disease. Never mind that, was the apparent reflection of the French public—Berthelot is a true savant; he is one of the glories of France, and the nation cannot do too much to honor him. It was a characteristic attitude of the time. Any civilized country would have felt and done the same.

In this large and vague way, the scientist no doubt has the modern world at his feet. The peoples are not ungrateful. They know their benefactors and their luminaries. Let it not be thought, however, that the man of science who boldly utters a conviction in conflict with popular belief will escape without rebuke or suffering. There was one discordant note in Berthelot's jubilee. He is a Positivist of the most thoroughgoing kind, and, in his modest little speech of acknowledgment, he made no concealment of his belief that he, in his old age, was merely a flickering light "on the point of being quenched in eternal night." It was to this confession of unfaith, we presume, that the *Journal des Débats* alluded when it said:

"It is to be regretted that, on the day when all the world, without distinction of opinion, was honoring in his person French science, he chose, by certain words of his discourse, to express personal convictions, and to emerge from the scientific domain to touch upon what concerns solely the individual conscience."

We say nothing of the justice of this criticism. We cite it simply to show the limits which are still put upon the acclaim awarded the scientist by the modern world. Beyond them he steps at his peril. If, like Huxley, he feels himself the discoverer of moral and religious, as well as scientific, truth, and, in uttering it, does so in his spirit of wishing that his epitaph might be, "He tried to help the people," he has to lay aside the authority of the savant, and take his buffeting like an ordinary polemic. Luckily for their work, few scientists feel, as Huxley did, that woe will be upon them if they preach not their gospel. They are, no doubt, happier, and probably are more useful, when they are content, like Darwin, slowly to instruct those who do preach. And we think that the hortatory instinct of science—especially when it is *ultra crepidam*—is abating as the years pass by. It is not so "earnest" as it used to be, in Bagehot's sense of the Englishman's native earnestness—that is, a vehement desire to make all the world think just as he does. To let knowledge do its own work, all in good time, is now, we think, the commoner resolve of the scientist. And he has come to see, too, that his guesses at the great riddles of existence may be no better than another man's; and that, in any case, he would do well to take the poet's advice, and

"Note not the pigment the while that the painting
determines humanity's joy and pain."

AMERICAN HISTORICAL ASSOCIATION.

WASHINGTON, January 1, 1902.

In point of numbers, the Washington meeting of the American Historical Association, December 27-31, was one of the most successful ever held. Of course, comparatively few of the sixteen hundred members of the Association will ever gather at any one place, however central or interesting the place may be; but the attendance this year was especially gratifying. The experiment of holding over Sunday was tried this year for the first time, and while the rain kept all but the most venturesome indoors the effect of including the extra day was certainly not shown in any decrease of attendance the following week, or in any complaint at the added time and expense. As was the case last year, the American Economic Association held its meeting in Washington simultaneously, two sessions taking the form of joint meetings of the two bodies.

The opening session, on Friday evening, was made notable by the address of the President, Charles Francis Adams. Relying upon "leave to print" for the complete exposition of his ideas, Mr. Adams chose to present informally and without notes an epitome of what he had written. His thesis, in substance, was the proposition that the Association, as the great organized historical body in the United States, might well undertake to pronounce upon the merits of some of the great political questions which from time to time stir the country, and, by settling once for all the facts in the case, help to remove such issues from the field of controversy and give them definitive settlement. As illustrations, Mr. Adams adduced the questions of slavery, the tariff, currency, Trusts, and Imperialism as the chief of those which had engrossed public attention within his own memory, and pointed out that to none of them had historical scholarship contributed at the time much of anything in the way of solution. The contention, vigorously and entertainingly put, was not, of course, new, nor, we may add, were its inherent difficulties greatly lessened by Mr. Adams's forcible discussion. If all citizens were as patriotic as they are well-informed, or if political campaigns turned upon facts rather than upon sentiment and machinery, there might be a place for the public meeting which Mr. Adams suggested should be held by the Association in every Presidential campaign; but it is unlikely that the Association will feel that its usefulness lies in that direction. It is significant, in this connection, that the plan for a monographic history of America which was recommended by the council last year, and referred back for further consideration, was this year reported upon adversely; the main reason for the change of heart being, it was understood, the practically unanimous feeling of the council that the Association would be going beyond its province if it were to put its official imprimatur on such a work, however valuable the work might be.

The second joint session, on Monday evening, brought out an extremely interesting paper by Prof. A. Lawrence Lowell of Harvard, on the comparative amount of party legislation in the House of Commons, Congress, and certain State Legislatures. Some colored diagrams, prepared with extraordinary labor, were peculiarly suggestive as illustrating the possible usefulness of graphic statistics in this field, though the results as a whole were too fragmentary to make generalization from them safe. A highly condensed paper by Professor Seligman of Columbia, on "Historical Materialism and the Economic Interpretation of History," called out a keen reply from Professor Cheyney of the University of Pennsylvania, who objected to "interpreting" history, whether by economic or other standards, save after exhaustive study of

the facts, while for large reaches of the subject the insufficiency of assured data formed, in his opinion, a bar to "interpretation" at all. The discussion, though highly entertaining, was one-sided, neither aspect of the case being stated in a well-balanced way, though it served to call attention to the mischief which has been wrought by scholars who, rating the economic aspects of things as of most worth, have assumed to find therein explanations which, unfortunately, do not always bear rigid historical examination.

The other session of most general interest was undoubtedly that of Saturday morning, devoted to the subject of public records and record-keeping. A paper by Professor Salmon of Vassar, on an American School of Historical Studies at Rome, was unimportant, but the one by Mr. Robert T. Swan, the Massachusetts Records Commissioner, on the work of his office, was a remarkable summing up of the solid results of ten years of well-directed effort. Thanks to Mr. Swan, the historian can now expect, with some confidence, to find in the towns and cities of Massachusetts, in available shape, the records in which alone the course of institutional development in the colony and State is to be studied; and he cannot do this as yet in any other State. Professor Burr of Cornell gave a summary account of the principal classes of European archives, together with useful practical suggestions for those proposing to undertake historical researches among them; and Mr. Herbert Putnam outlined the great work which the Library of Congress is carrying on in the interest of historical investigation. By the courtesy of Mr. Putnam, the session was held at the Library, which was opened on the occasion for special inspection, and the members of the Association were entertained there at luncheon.

Of the other papers read, the most important, perhaps, were those of Professor Robinson of Columbia, on recent literature of the Reformation, notable for its praise of Jansen; and of Professor Emerton of Harvard, on the chronology of Erasmus's letters. The final session, on Southern history, was full of promise for the continued spread of sound historical work in the South. A much-anticipated paper by Professor Turner of the University of Wisconsin, on the diplomatic antecedents of the Louisiana purchase, was, in the absence of the author, not read. The church-history section continues to languish, a mere handful of people being in attendance. With the amount of good work in church history now being done in this country, it would seem as though a session of the Association devoted to the subject ought to be able to maintain itself with vigor; but, at the present rate of decline, the section, formally a part of the programme, seems threatened with extinction. In most of the sessions there was a lack of informal discussion, the so-called discussion which appeared on the programme generally resolving itself into another paper of ten minutes instead of twenty in length.

Thanks to the vigorous policy of the Council and the wise management of the Association's limited funds, the manifold activities of the Association continue to flourish. Probably no learned society in the United States is carrying on so many important undertakings. Socially, the Washington meeting was less beset with formal "functions" than recent ones have been, but the opportunity for the cultivation of personal acquaintance was all the greater in consequence, and was favorably commented upon. Unfortunately, the meetings do not yet offer much in social ways to women, although the women members are numerous; nor is Canada, although included in the field of the Association, much represented. A meeting at Toronto or Montreal would doubtless go far to solve the latter problem, but the solution of the former has not yet been found. The Association meets next year at Philadelphia, with Capt. A. T. Mahan as President.

THE ECONOMIC ASSOCIATION IN WASHINGTON.

January 6, 1902.

All things considered, it is doubtful whether the American Economic Association has ever had a more satisfactory session than the fourteenth annual meeting held in Washington on December 27-30. The programme was not particularly brilliant, there was no extraordinary incident, but, in the general qualities that constitute a successful meeting—representative attendance, sustained interest, social intercourse—the days in Washington left nothing to be desired. The meeting was, indeed, not without its sad note—a sense of loss that came to many of those present from the absence of familiar faces. The distressing deaths of Profs. Richmond Mayo-Smith of Columbia and Sidney Sherwood of Johns Hopkins add to the long list of economists cut off in the very prime of scientific manhood. President Hadley's incisive criticisms would have been a welcome contribution to more than one debate. Professor Taussig's temporary absence, Professor Ashley's departure to his Birmingham post, Professor Jenks's studies in the Far East, and Dr. Rowe's and Mr. Willoughby's activities in Porto Rico were all noted, in this connection, with regret. Yet to him who contrasted the meeting with the one last held in Washington, eleven years ago, the evidence was overwhelming as to how bravely the torch is being passed on. Both in numbers and in influence the economic circle is growing. Still far removed from the class whom the lamented Herbert B. Adams was fond of describing as "alte Herren," the little group of American economists who returned to this country some thirty years ago, with the substantial equipment of European scholarship, to find only grudging academic recognition, could look about and behold at least two distinct generations—their pupils and their pupils' pupils—toiling manfully where only solitary workers long struggled.

The opening session of the meeting was held on Friday evening with the American Historical Association, and was devoted to the presidential addresses. For the economists, President Ely presented a most suggestive paper on "Industrial Liberty." He contrasted the eighteenth-century concept, that industrial liberty was something to be achieved by negative political action, with the modern view that true liberty means the expression of positive powers of the individual, and that it can be reached only after a long and arduous constructive process. Liberty cannot be an absolute ideal, because authority is needed in society in order to secure the harmonious coöperation of its various elements, and without social authority we could have no production of wealth, and we should lack the material basis of that large and positive liberty which enables us to employ our faculties in the common service. This social authority rests, for the most part, upon the great institutions of society—property, vested interests, contract, and personal conditions. To only a limited extent is there a direct political basis for the authority whereby one man brings into harmonious coöperation other men, in the work of production. The basis of social authority is, for the most part, institutional. On the other hand, Socialism furnishes us with no sufficient ideal of industrial liberty. Going to the other extreme from anarchy, it would find a political basis for that social authority through which the industrial coöperation of men is effected. It would limit the range of free choice, and restrict liberty, although to a less degree than anarchy. The true ideal lies midway between anarchy and Socialism, and may be termed the principle of social solidarity. According to this principle, the great institutions of society must be conserved, but developed in the interests of liberty positively conceived. There must be a carefully elaborated and wisely executed regulation of economic relations.

With no less interest but with perceptibly greater dissent, the economists heard the fluent address of President Charles Francis Adams of the Historical Association upon "An Undeveloped Function." Animated, apparently, by the sentiment of the dear old lady who discouraged the study of ancient history upon the ground that we should "let bygones be bygones," President Adams urged a livelier interest on the part of scholars in that politics which is present history, and himself set an unmistakable example by a discussion, as original as it was unhesitating, of the two conspicuous problems of the day—Trusts and Imperialism. At a subsequent session of the meeting, historical sentiment paid its respects in no uncertain tones to the economic interpreters of history. But the castigated only chuckled, for examples of the historical interpretation of economics were still a refreshing memory.

International trade was the general topic of the second session, with papers by Mr. Brooks Adams and Mr. Worthington C. Ford, and discussion by Mr. George E. Roberts, Mr. Charles A. Conant, and Professor Emery. Mr. Adams undertook to analyze the meaning of the recent expansion of the foreign trade of the United States, and found the key in a law of civilization in accordance with which "the centre of human society is shifting very rapidly, the seat of mineral production and of commercial exchanges is migrating westward, the lines of transportation are straightening to correspond, and London is ceasing to be the universal mart." If the United States push her consequent advantages home and drive her rivals to extremity, she appears to lie open to two methods of attack. European nations, singly or in combination, may attempt commercial exclusion somewhat on the principle on which Napoleon acted against England; or they may adopt a policy which will lead to war, such, for example, as dis-

regarding the Monroe Doctrine. In illuminating the future and in marking the path toward danger, lies the opportunity of modern economic inquiry.

Mr. Ford's message was less alarming. A careful review of the more important incidents connected with the recent experience of the leading nations of Europe in tariffs and commercial treaties, leads to the conclusion that a combination among European nations against the commercial interests of the United States is a safely remote possibility. "There are too many oppositions to be overcome, too many competing interests to be harmonized, too many political considerations to be altered, to allow a general consensus of opinion and action." Where mischief may be done is in the isolated action of each nation of Europe against the trade of the United States. The damage to our interests may be all the greater because of the conscious imitation of regulation by more than one Power. To conciliate opposition by wise concession is the part of true statesmanship; to offer a better use of our undeniably great resources is the true economic policy of the United States, and this betterment cannot be obtained by wilfully closing the best markets to our profits. The tariff should not be an implement of offence, of commercial war, but one of revenue and commercial peace.

Of very great significance was the fact that economic theory was less prominent in the programme than ever before. Saturday afternoon's session was nominally devoted to theory, but both Professor Carver's paper on "Some Theoretical Possibilities of a Protective Tariff" and Professor Tuttle's study of "The Position of the Workman in the Light of Economic Progress" stood in as immediate relation to applied as to theoretical economics. Dr. Carver attempted to demonstrate, by characteristically acute reasoning, (1) that a tariff duty is not necessarily paid by the home consumer; (2) that a protective tariff may be so framed as to raise wages; (3) that a protective tariff may be so framed as to attract labor and capital from the less productive into the more productive industries—judged from the standpoint of the community rather than that of the individual business man. Professor Tuttle urged the larger recognition of the laborer's property right in industry, and suggested the possibility of State indemnification for labor discharge due to industrial invention. The study of the labor problem thus introduced was continued in the evening session by Mr. Alfred H. Stone's entertaining paper on "The Negro in the Yazoo-Mississippi Delta," and by Mr. Herman Justi's detailed account of "Conciliation and Arbitration among Miners in Illinois," with discussion by Mr. L. G. Powers of the Census Office and Hon. Carroll D. Wright of the Department of Labor.

Monday afternoon was devoted to public finance. The opening paper was one of the most interesting of the meeting, "Porto Rican Finance: A Comparative Study of Spanish and American Systems of Colonial Finance," by Dr. T. S. Adams of the University of Wisconsin, who, as assistant to the Treasurer of Porto Rico, had rendered important service in the financial reorganization of the island. Dr. Adams's paper was a critical account of the financial methods prevailing in Porto Rico prior to the American occupation, and of the changes introduced during the period of American military government, together with an outline of the comprehensive reconstruction effected under civil rule. The Americanization of Porto Rico, Dr. Adams summarized, has meant, from the fiscal viewpoint, first, a substantial reduction in the burden of taxation; second, a simplification of the system of taxation; third, a relative increase in the taxation of accumulated property as opposed to the sale, consumption, and transfer of property; and, finally, a shifting of the centre of gravity of the consumption taxes from the consumer of codfish and pork to the consumer of rum and tobacco. "Whether the two classes of consumers are different or not," he concluded, "is, I must confess, a doubtful question. It is to be hoped, however, that under the present arrangement the peon will get a little more codfish and a little less rum."

In the discussion which followed, Professor Hollander of Johns Hopkins, late Treasurer of the island, after noting the mutual obligation in successful financiering of the financial theorist and the financial administrator, reported as to the actual working of the new revenue system. For the five months ending November 30, 1901, the ordinary receipts of the insular treasury have been $1,000,542.62. The ordinary expenditures for the same period have been $881,976.64, making an excess of receipts over expenditures of $118,565.98. Or, comparing actual with estimated receipts, it appears that, in each of the three essential sources of insular revenue, the actual receipts have justified the budgetary estimates, and in two cases by comfortable margins. In financial matters five months constitute an insufficient period for safe prophecy as to the results of a twelvemonth; but, considering the facts at hand and the tendencies now evident, there seems full reason for supposing that, with no disturbing factor or unexpected occurrence, the aggregate budgetary estimate for the fiscal year will be safely realized. It would be ridiculous to suppose that all further occasion for financial legislation in Porto Rico has been removed. But it is only time, experience, and specific conditions that will clearly indicate where and when—without any departure from fundamental principles—omission, amendment, or addition is desirable. In any event, it seems no unwarranted optimism to believe that, both in subjective appreciation and in objective fact, a secure and enduring financial basis has been laid.

The Committee on Uniform Municipal Accounts and Statistics, through its Chairman, Mr. M. N. Baker, brought the report of 1900 again before the attention of the Association. In the year which has elapsed, the Committee reported, it has become generally accepted that the interests of good municipal government and the intelligent solution of certain mooted questions of municipal policy demand that municipal statistics be collected and published, and that such statistics, to be of prime service, must be based on uniform municipal accounting. The prior recommendations of the Committee relating to State boards of municipal control and the publication of State summaries of local activities, it was added, might be left with advantage until the movement obtained more definite shape and greater force. The annual summary of the United States Department of Labor was commended, and the question was raised as to what the present Census Office might undertake with advantage in the way of municipal statistics. A similar committee has been appointed by the National Municipal League, and is coöperating in the attempt to formulate a general system of uniform municipal accounting and in the collection of statistical summaries of municipal activities.

The active discussion of the Committee's statement by Mr. Charles E. Curtis of New Haven, Dr. Roland P. Falkner of the Library of Congress, Dr. Edward M. Hartwell of the Boston Statistical Department, clearly illustrated the dependence of any systematic study of local finances in the United States upon the prior collection of statistical and descriptive material. It is absolutely certain that no one who has lacked opportunity to acquaint himself by actual experience can realize adequately the crude, chaotic condition of the public records of the ordinary American city, and the difficulties and embarrassments encountered by the investigator in studying the situation and by the legislator in improving it. Some evidence of this is afforded by Professor Clow's recent monograph on the city budget, in which, with no small industry and persistence, a path has been blazed in a dense financial wilderness. The keynote of the debate was, however, progressive effort; and emphasis was laid upon the fact that, while the agitation for uniform municipal accounting might very properly be continued, yet earlier results of no small consequence might be expected from the collection of statistical summaries, projected or in progress by public agencies.

The final session of the meeting was held on Monday evening, again jointly with the American Historical Association. The economists' contribution to the programme was a thoughtful paper by Professor Seligman of Columbia, on "The Economic Interpretation of History." Critical examination was made of the successive objections commonly urged against the doctrine of "historic materialism": First, that the theory of economic interpretation is a fatalistic theory; second, that it rests on the assumption of historical laws whose very existence is open to question; third, that it is socialistic; fourth, that it neglects the ethical and spiritual forces of history; fifth, that it leads to absurd exaggerations. Professor Seligman's reasonable conclusion was that, as a philosophical doctrine of universal validity, the theory of historical materialism can no longer be successfully defended. But, in the narrower sense of economic interpretation of history—in the sense, namely, that the economic factor has been of the utmost importance in history, and that the historical factor must be reckoned with in economics—the theory has been and still is of considerable significance. Professor Cheyney of the University of Pennsylvania discussed the paper entertainingly, and characterized economic interpretation as misleading, because of its *a-priori* method, and as premature because more complete historical writing must precede any effort at intelligent interpretation.

The meetings of the Council disclosed a

gratifying state of affairs in the internal economy of the Association; the increase of membership during President Ely's administration being especially encouraging. For the ensuing year, Professor Seligman succeeds to the presidency, Professor Fetter becomes permanent instead of acting Secretary, and Professor Hollander takes the chairmanship of the Publication Committee.

A GLIMPSE OF CUBA.

December, 1901.

It is perhaps owing to our habit of looking at the West Indies on maps which cover a great area, that the visitor who travels through the island is surprised to find it so big. It is larger than Pennsylvania or Louisiana, almost as large as England, and much bigger than all the other West India islands put together. In so wide an area there are diversities of physical character and aspect so numerous that no tourist, unless he had spent many months in journeying to and fro through the country—a slow process where railways are few and roads bad or wanting—could undertake to render a general account of it. But a few general impressions may be worth giving, so scanty is the knowledge which most of us have about the island whose fate now lies in the hands of Congress.

Broadly speaking, it is a country pleasing to the eye and often very pretty. It is verdant, being for the most part well watered; and though there are large tracts of nearly level ground, one is seldom out of sight of some hill sufficient to relieve the monotony of a flat. Where there are pastures, the grass is luxuriant. Where there are woods, the trees have the rich luxuriance of the tropics. Many bear clustered flowers, others support climbing plants gay with brilliant blossoms. The most romantic regions are to be found in the southeast, where some of the mountains reach a height of eight thousand feet—a height all the more imposing because several of the highest tops rise not far from the sea, and thus display the full stateliness of their proportions. But, both in the west end of the island and in other places here and there through it, there are fine groups of hills, whose boldness of line and profusion of wood make them beautiful objects. Some parts of the south coast, such as that which stretches east and west from the city of Santiago de Cuba, are specially charming, for here are bold cliffs and rock-encircled bays, with forest slopes above. In other places the shore is bordered by a fringe of coral isles, usually called cays, all thickly wooded, through which the coasting steamers thread their way, happy in having no longer to fear the buccaneers, or, in later days, the coast pirates, who found in this maze of islets safe retreats whence they could issue to pounce upon a passing vessel.

It is also a healthy country. The yellow fever which used to give it a bad name has now been discovered to be a preventible disease. Already the efforts of the American administration have, for the moment, practically stamped it out in Havana and Santiago; and there is reason to hope that if the measures now taken are rigorously maintained, this deliverance will be permanent. Malarial fevers occur in some places, but are apparently less frequent and formidable than on the Gulf coast of the United States and of Mexico. Now that they too have been ascertained to be mainly, if not wholly, due to infection through a mosquito, they too may be largely averted. Almost everywhere one is struck by the freshness of the air, which is far more agreeable and invigorating than that of Florida or southern Alabama. One has a sense in the aspect of the sky and the feel of the breeze of being within reach of the sea; and there are indeed few parts of the island which are more than forty miles from salt water. Thus the heat, having regard to the latitude (for nearly the whole of Cuba lies south of the Tropic of Cancer), is moderate and bearable. Sunstroke is said to be extremely rare.

Further, it is a naturally rich country. In the plains and undulating regions the soil is usually deep and fertile; and the rains of the hotter months (for there is no very great difference between the temperatures of summer and winter) are sufficient to make artificial irrigation needless, except in comparatively few places. Nearly every tropical or sub-tropical crop can be grown in one district or another. There are immense stretches of pasture-land, covered by luxuriant grass. There are vast forest tracts, chiefly on the mountains, some of which remain almost unexplored to this day, because the cost of transportation in regions ill supplied with roads or railways has made it not worth while to cut the wood. There are mines of iron, copper, and manganese, and there may well be other minerals also, for the resources of the island have been very imperfectly ascertained. Few countries make upon the passing traveller a stronger impression of great natural wealth.

But Cuba is an empty country. In its 46,000 square miles there are only some 1,600,000 inhabitants, against 6,000,000 in Pennsylvania. Porto Rico, with only 3,600 square miles, is less than one-twelfth in size, but has about half as large a population. One is everywhere struck by the fewness of the inhabitants. It is not only that vast tracts of mountain and forest remain in their primitive wildness. Even level and open regions, fit for village or pasture, are practically a solitude, with only a few negro huts here and there. One sees deep-soiled plains without sugar-plantations, luxuriant meadows and grassy hillsides without cattle. This desolation is no doubt partly due to the too protracted insurrections, in which many plantations were laid waste, many sugar-factories destroyed, and nearly all the cattle slaughtered. But, even before war came in to devastate the land, the country must have had a population far beneath that which it could support. Agriculture and stock-keeping would alone, without counting mining or any kind of manufactures, provide employment and food for at least five millions of persons. There is only one considerable city, Havana; and only three or four others with populations exceeding thirty thousand, all of them on the coast. The interior has scarce anything to show but wretched villages composed of the huts of colored people.

How far this desolate condition of a land which nature has blessed is due to Spanish misgovernment, how far to the inferior quality of the inhabitants, it would need many pages to discuss. That there was deplorable and long-continued misgovernment, and that the present inhabitants are slack and backward, has been amply known to all the world. The presence of a large number of negroes, and the existence of slavery (though in no very harsh form) down to a recent date, account for a good deal of slackness in the people; and this fault was intensified by misgovernment, while it tended to perpetuate that misgovernment itself, for a more energetic race would not have so long borne with the corruption and maladministration of Spanish officials. At present one of the crying wants of the country is more labor and better labor. The colored population seems to occupy a sort of middle place between the intelligent and industrious negroes of Kentucky, Tennessee, and northern Alabama and the half-savage negroes of Hayti. They are not sunk deep in sloth and superstition, but they are not progressive; and if Cuba is to become prosperous, it will hardly be through them. The hopes of the better class of Cubans are chiefly fixed upon immigration from old Spain. This immigration is now proceeding at a great pace, but, unfortunately, the immigrants, who are mostly thrifty and hardworking fellows from the northern provinces of Spain, do not generally bring women with them, so it is feared that they will, through intermarriage with the blacks and half-breeds they find in the island, decline in a generation or two nearer to the level of that inferior element. Besides, it is hard for any European race, even for a race from southern Europe, to retain its vigor of body and mind under a tropical climate. It will be interesting to see what the results are; but those results can hardly be estimated before the end of the century on which we are now entering.

There is also another impression which the visitor receives and by which he is startled: Cuba is not a good country for insurrections. Except in the east, in parts of the southern coast, and in a few districts of the west, the country is generally pretty open and level and comparatively easy for the movement of regular troops, and comparatively unfavorable to insurgent bands. It is true that the source and the strength of the rebels lay in the mountainous and forest-clad east, where the negro population is largest. (The bands were chiefly composed of negroes, though many of the leaders were whites or mulattoes.) But in the last rebellion the rebel bands were practically in command of the level and undulating parts of the interior to the south and southeast of Havana and Matanzas, though it ought to have been easy for the Spaniards to hold these districts. The Spanish Government had a vastly preponderating force, exceeding (as one is told) 200,000 men, while the strength of the insurgent bands, who were, moreover, armed with inferior weapons, seems never to have reached 30,000 at any one time. Besides, the Spaniards had complete command of the sea—an enormous advantage in a country with bad roads, and most of which lies within thirty or forty miles of the coast. These facts make it all the more extraordinary that the two great insurrections should not each of them have been quelled within a few months, or at any rate driven into the less accessible parts of the island. People in Cuba explain the phenomenon by saying that the Spanish officers, or at any

rate some important persons among them, did not really wish to stamp out the insurrection, whose continuance gave them opportunities of enriching themselves through extra pay and through contracts for military stores and supplies of various kinds. If this be true, these officers overplayed their game with a characteristic want of foresight, for any one might have predicted from the beginning of 1897, if not earlier, that foreign intervention was approaching. It is, at any rate, clear, that, if the Spanish officials really wished to suppress the insurrection, there must have been extraordinary incapacity and probably a great deal of corruption among them, for the balance of military strength was altogether in their favor, and a large part of the population was always on their side.

During the last few months Cuba—that is to say, the intelligent part of the Cuban population, and especially those who have something to lose or to gain—has been agitated by two questions: the promised departure of the American administrators and the promised arrival of Sir William Van Horne, the Canadian railway magnate, who has undertaken a large scheme for the construction of a trunk line through the east and east-central parts of the island. These two events are intimately connected, for with the withdrawal of American administration a new chapter in Cuban history will open, and no one knows what sort of government will be created, what sort of order will be kept, what sort of facilities for agricultural and commercial development will be provided. Yet it is largely upon these things that the success of railway schemes must depend. Whatever opinions any one may hold as to the need for American intervention in 1898, or as to the policy which Congress and the Executive have followed since then, there ought not to be any difference of opinion as to the admirable spirit in which Gen. Wood and his principal subordinates have discharged their difficult task, or as to the substantial value of the work they have done for Cuba. But these topics are too large to be entered on at the end of a letter.

Correspondence.

CANADA AND ALASKA.

To the Editor of The Nation:

Sir: Your correspondent, T. W. Balch, states that there is nothing to arbitrate in the dispute between Canada and the United States over the boundary between Alaska and our northwest territories. Whether this is so may be learned from the notes exchanged between the United Kingdom and the United States upon the subject up to and including those of October 20, 1899, fixing a provisional boundary. Here it will be found that the problem at issue involves the interpretation of a treaty made between England and Russia in 1825, whose terms are ambiguous, requiring for their true construction a consideration of the state of geographical knowledge at the time the document was signed, a reference to the correspondence which led up to it, and the application of well-known principles of international law.

Article iii. of the treaty provided that, from a certain point at 56 degrees north latitude, "the line of demarcation shall follow the crest of the mountains situated parallel to the coast, as far as its point of intersection with the 141st degree of west longitude." The whole region is highly mountainous, and the question arises, what are the mountains whose crest is to be followed?

Article iv., section 2, provides that where the crest of the mountains is more than ten miles from the shore, the line shall be drawn parallel to the sinuosities of the coast, but never to be more than ten marine leagues from it. Upon this ground the United States raises the contention that the boundary is intended to be throughout not less than thirty miles from the ocean, whereas the language of the document is "not more than."

Further, the question arises, what is the "coast" spoken of? In the negotiations which preceded the treaty of 1825, the Russian plenipotentiaries distinguished between the "coast" of the main ocean and the shores of inlets. Canada takes her stand upon the sense in which the term was used by those who drew up the treaty. Is that position so clearly wrong that it is not even open to argument?

Your correspondent says: "The evidence in the case is all in favor of the United States, and shows that they are entitled, by long, uninterrupted occupancy and other rights, to an unbroken strip of territory on the mainland from Mount St. Elias down to the Portland Canal." Why, then, is the United States unwilling to submit its claims to an impartial tribunal?

Canada sought to have this frontier ascertained in 1872, shortly after the purchase of Alaska by the United States, but without success, although Hamilton Fish, the Secretary of State, was favorable. In 1892 an international survey commission was appointed to ascertain facts and data, and the commission made a joint report on December 31, 1895, accompanied with elaborate maps and photographic views. Up to this time Vancouver's maps, made in 1792, were the standard and only original authority, except that the shores of the Lynn Canal had been surveyed in 1881. In 1898-99 the British delegates to the International Commission, including Lord Herschell, offered certain terms to the United States, and, in the event of these not being acceptable, they expressed their willingness to refer the whole question to arbitration on the lines of the Venezuela boundary treaty. That treaty provided that adverse holding for fifty years should make a good title, and also that such effect should be given to occupation for less than fifty years as reason, justice, the principles of international law, and the equities of the case required. The United States Commissioners refused both offers, making, however, a counter-proposal that, in the event of their consenting to arbitration, it should be provided beforehand that the settlements on tidewater made on the authority of the United States should continue to be American territory, even though they might prove to be on the British side of the line. In other words, they demanded that Canada should yield her rights as a preliminary condition to having those rights determined.

The claims put forward by Canada are made in good faith, and based upon grounds which, if disputable, are none the less solid. The issue is precisely of the kind to which arbitration is suitable. Yet the United States, which insisted upon arbitration in the Venezuela boundary difficulty, refuses it here, acts as judge and advocate in its own cause, and decides that there is "nothing to arbitrate."

R. W. Shannon.

Ottawa, Canada, January 11, 1902.

STERNE'S INFLUENCE IN FRANCE.

To the Editor of The Nation:

Sir: In reviewing last week (January 9) the December meeting of the Modern Language Association, "N. M." says: "Professor Baldwin showed that the influence of Sterne's works upon French literature had been much underestimated." This conclusion would hardly be possible, in view of the studies of M. Texte. At any rate, my point was, that the influence of Sterne in France, being the influence almost exclusively of 'Tristram Shandy,' and leading only to a certain kind of imitation, could hardly be called literary. Of Sterne's best art, the 'Sentimental Journey,' the only direct literary influence known to me, in spite of the many French translations, is the 'Voyage autour de ma Chambre' of Xavier de Maistre. Instead of "underestimated," therefore, the word should be *misinterpreted*. I shall be obliged by this correction—the more, if it lead to any suggestion of further evidence for or against my actual conclusion.

Charles Sears Baldwin.

Yale University, January 11, 1902.

Notes.

Mr. Clarke Conwell, The Elston Press, Pelham Road, New Rochelle, N. Y., will publish directly 'The Art and Craft of Printing,' by William Morris, being a complete record of Morris's speeches and writings on this theme and his work at the Kelmscott Press, with reproductions of many ornaments and sample pages. Mr. Conwell also announces as in press Morris's 'Some Notes on Early Woodcut Books.'

A study of Robespierre, by Hilaire Belloc; 'The Apostles' Creed: Its Origin, its Purpose, and its Historical Interpretation,' by Dr. Arthur C. McGiffert; and 'Through Science to Faith,' by Dr. Newman Smyth, are forthcoming from Charles Scribner's Sons.

D. Appleton & Co. open, this month, their "World Series" with 'Britain and the British Seas,' by H. J. Mackinder; and will also have ready 'Financial Crises and Periods of Industrial and Commercial Depression,' by Theodore E. Burton.

'The Life of a Century: 1800 to 1900,' by Edwin Hodder (London: Newnes; New York: Charles Scribner's Sons), is a popular compilation, occupied mainly with the history and development of the British Empire during the period which it covers. Its record of mechanical progress takes a wider range, including even an account of the steel skyscrapers of New York. The book makes no pretension to philosophical or literary value, but it is likely to answer well enough its purpose of supplying "a readable narrative," and it is, in the main, accurate, though not quite free from political partisanship. It contains over five hundred illustrations.

The second volume of Mr. Rhees's documentary History of the Smithsonian Institution, of which we recently noticed volume i., has appeared. It contains papers connected with the Fiftieth to the Fifty-fifth Congresses, 1887-1899, and forms a volume of more than 800 pages, closing with a list of the official members of the "Establishment" and a copious index. Among the matters treated, of especial public interest are the establishment of the National Zoological Park and the Astrophysical Observatory. Altogether the two volumes preserve in convenient form a mass of information as to the inception and growth of a unique scientific institution, which will be of permanent value to those interested either in the functions of our Government, the attitude of public men towards science, or the evolution of scientific agencies.

'The Latin Quarter' is the title by which the translators seek to represent Mürger's 'Scènes de la vie de Bohème' (Doubleday, Page & Co.). The inevitable disappearance, in translation, of much of the characteristic humor and wit serves to emphasize the sordid side of the life depicted; here and there familiar expressions have been misunderstood. At the opening of chapter xiii., Colline was eager to see his speculations *en caractère Cicéro*, that is, in the special type so called; the phrase has no reference to the *Ciceronic* quality of Colline's style, as the translator puts it. Musette's projected marriage draws from Rodolphe the natural exclamation, "Contre qui, Seigneur?" feebly and incorrectly rendered in "To whom, my lord?" Mr. Arthur Symons's introduction is not indispensable.

Translations of Alphonse Daudet's 'Lettres de Mon Moulin' and 'Contes du Lundi' have been added to the series of "Little Masterpieces" (Boston: Little, Brown & Co.). In the former it may be noted that "Il les perdait toutes de la même façon" does not mean "He lost them *in all kinds of ways*" (p. 18). Again, by the sot who "si souvent secouait les puces à sa pauvre Clairon," Daudet colloquially describes a wife-beater, not a man who ungallantly "shook his fleas on his poor Clairette." The introduction to the 'Contes' contains a few questionable literary statements, such as that "Daudet was, *in a certain sense*, the pioneer of the modern Short Story in France."

To the discussion of university reorganization, in its bearings on the substitution of modern languages for the classics, M. Gustave Lanson contributed several articles in the *Figaro*, now collected in book form, under the title, 'L'Université et la Société Moderne' (Paris: Armand Colin). The question being practically settled, the chief interest of this little volume rests rather on the clear common-sense views of its author than on its value as a factor in the decisions. But, for unconventionality of opinion, M. Lanson is certainly remarkable among the disputants. He does not hesitate to tell his countrymen of the bias given to French culture through excess of literary training; and he also insists that modern languages, in order to justify their presence among higher studies, must reject scholastic, for strictly practical, methods.

A second attempt this season to improve on Mother Goose, 'Mother Goose's Menagerie,' by Carolyn Wells, with colored illustrations by Peter Newell (Boston: Noyes, Platt & Co.), proves equally futile with the first. Miss Wells's ear for rhythm is insufficient for her ambitious metres, and her jests are often much above her audience. Mr. Newell's designs are narrowly mannered, but have some drollery and are better than the jingles.

Dodd, Mead & Co. issue in pamphlet form a 'Bibliography of the First Editions in Book Form of the Works of Alfred, Lord Tennyson.' The limitation expressed in the title is, we think, regrettable, for a little more diligence would have added to the list the place of first publication of every poem of Tennyson's. But perhaps it was too much to expect that both the student of literary history and the collector should be regarded in a work of this character. Bibliographically, the work seems to be thoroughly done, being more complete than any previous work in this field. The descriptions are full and accurate, and the title-pages of the most notable issues are reproduced. The primary object of the work is to describe accurately a complete series of Tennyson first editions which Dodd, Mead & Co. have gradually brought together and now offer for sale. But since the list grew to be, for collectors' purposes, a complete bibliography of Tennyson, it is issued in two editions of 250 and 56 copies respectively.

We cannot praise the technical quality of Professor Du Bois's "Select Bibliography of the American Negro, for General Readers," one of the Atlanta University publications. "Explicit suggestions and criticisms are invited" on the title-page, and we will remark that the classification is quite erratic, the sub-arrangement neither alphabetical nor geographical, the typographical errors too numerous—"F. J. May" for Samuel J., "Nicholay and Hay" for Nicolay—the references far too vague, *e. g.*, "*Nation*, xxviii." Why should Olive Schreiner's 'Trooper Peter Halket in Mashonaland' be found here? Why should works on fugitive slaves and the Underground Railroad be classed under "Emancipation," being ante-bellum in theme; and the Life of Garrison be placed under the same rubric and not under the preceding one, "Abolition Movement?" This well-meant little pamphlet betrays inexperience and a mind not orderly.

The "Annual List" of new and important books added to the Boston Public Library contains 206 pages of titles classified under 22 subjects. It makes a handy reference chronicle of the English literature of the past year on nearly every conceivable topic. In addition to the synopsis of classification, there is an index of biographies arranged alphabetically by subjects.

The London *Publishers' Circular* for December 21, 1901, contains a complete exposure of the latest Bacon-Shakspere cypherer, viz., Mrs. E. W. Gallup. This lady, having found the key, has extracted a prose translation of Homer's Iliad hidden in cypher by Bacon in Burton's 'Anatomy of Melancholy.' Mr. R. B. Marston, editor of the *Circular*, shows, with the aid of the deadly parallel column, that Bacon relied, then, mainly on Pope's translation nearly a century before it was published. This beats the feat of Shaksperizing all hollow. True, however, to his old instinct of concealment, Bacon altered Pope's "thirty sable vessels" into "thirty sable shippes," and "Messe for silver doves renowned" into "Messeis, renowned for silver doves"; yet took all the risks of prophetic plagiarism when he followed Pope in numberless divergences from Homer of insertion and omission. But perhaps he anticipated that posterity might adopt Mr. Marston's charitable view that "Pope must have discovered the key to his cypher, and cribbed his translation." Mr. Marston admits that Mrs. Gallup's "bilateral cypher" imposed upon him at first, from the samples, as it did upon the cynical W. H. Mallock.

In a review published in the *Expository Times*, of Edinburgh, Prof. J. G. Tasker calls attention to a curious slip in a recent bibliography in the *Theologische Rundschau*. Under the heading "History of Israel" he has found the following entry: "Lamb (Charles), Essays of Elia." "Let us hope," comments Professor Tasker, "that the mistake has introduced some German student of the Hebrew prophet's life to the genial English essayist."

By a kind of poetic justice, among the very first undertakings of the new International Association of Academies of Sciences is to be a critical edition of the entire literary remains of the philosopher Leibniz, as it was he who first advocated the international union of savants that has only now been realized. The actual work of preparing this edition is being done jointly by the Royal Academy of Berlin and the Paris Academy of Sciences, and Academy of Moral and Political Sciences, the original proposal having emanated from the last-mentioned. The phenomenal range of learning and literary activity of Leibniz made it practically impossible for a single Academy to produce this edition, the preparation of which requires the combined efforts of mathematicians, philosophers, theologians, jurists, and historians. The edition will contain from 130 to 140 volumes.

The extensive excavations which the French Government has been making in Delphi since 1892 are approaching completion. The most important work done recently has been to lay bare the Pythian Stadium, which is nearly 178 metres in length and from 25 to 28 metres wide. As the whole sacred district of Delphi consists of rocky terraces, it was not an easy task to build a hippodrome on the very sides of Parnassus. The vast expense of the work can be judged from the detailed reports of the costs, which are still extant. It has been found that, at the starting-place, small depressions were dug out, where those who participated in the races were compelled to stand until the signal was given. There are starting-places for eighteen runners. That these took their calling seriously is evident from an inscription, dating probably from the fifth pre-Christian century, which reads as follows: "No wine shall be brought into the temple of Eudromos [the god of the racers]; but if it nevertheless be, then he for whom it is brought shall appease the god with a sacrifice, and pay five drachmas, of which the informer shall receive one-half."

A geological map of Saxony has recently been completed for the Government of that kingdom, consisting of no less than 123 separate sections, each covering about two square miles of territory, and each representing a year's labor on the part of one geologist at a cost of preparation ranging from thirty to forty thousand marks. It has already proved useful in determining the routes of new railroads, and especially in securing new water supplies for the

cities of Leipzig and Chemnitz. The agricultural and mining interests of the country will also be materially helped by these geological surveys.

There are some indications of a reaction in German universities against a continuation or increase of the privileges which have been granted to women in recent years. In Koenigsberg, the head professor of anatomy, Dr. Stieda, as well as his colleagues holding the chairs of chemistry and of physics, Drs. Lossen and Pape, have united in excluding all women from their lectures and exercises, and this makes it practically impossible for women to study medicine in that university. As a number of professors in the faculties of theology and of philosophy have taken the same steps, women students are excluded from all real university privileges in Koenigsberg. So far, no other German Government shows any sign of following the example of Baden, which permits the matriculation of women in its two universities of Heidelberg and Freiberg. The women, however, are rushing to Berlin as nowhere else, the attendance this winter term being more than six hundred, while a year ago it was only 439, and last summer 303.

—The dead-and-alive character of most of our historical societies needed for its relief such a presidential direction as that of Mr. Charles Francis Adams, in Massachusetts. He has been struck with their aloofness from what it is the fashion to call "history in the making." Discussions in their meetings, and papers (not personal) in their proceedings, seldom postdate the Revolution or at most the war of 1812. An innovation upon this quietism has been made—and it is one of the great merits of the enterprise—in the conduct of the *American Historical Review*. Hence it was peculiarly fitting that Mr. Adams's address at the late meeting in Washington of the American Historical Association should have the place of honor in the January number of the *Review*. It is charged with gunpowder and calculated to receive all the criticism it challenges. It passes in review the main issues and the intellectual debate of the Presidential canvasses from 1856 to 1900, and concludes by recommending that the Association take a hand in each campaign hereafter, by holding at least one meeting in July for the instruction of the voter in the nature of the contest and his duty in the premises. We shall comment upon this no further than by saying that it is a common observation how little the professional study of history fits a scholar to become a political leader, or to arrive at an infallible judgment in the infinite variety of issues which attend a nation's political evolution. We apprehend that, in the case of our Imperial policy—one of the burning questions which Mr. Adams faces—our chief historians have shown either timidity or indecision, or have boldly gone counter to the highest and plainest traditions of this republic. However, we cannot say of them, as Lafontaine says of the animals and the plague:

> "Ils ne mouraient pas tous, mais tous étaient frappés."

Some, to their honor, were not smitten with Imperialism. Hence, had Mr. Adams's July convention been held in 1900, it is certain that the voter would have listened to jarring notes of exposition of the issues involved, of doctrine as to the true teachings of history, and of counsel. We fear, in a word, that the stirring author of "A College Fetish" is endeavoring to make a fetish of "History." And yet—at least for the sake of the historians themselves—let us have the convention!

—The most striking features to one who glances over the *Annuaire de l'École Pratique des Hautes Etudes* (1902), are the wide hospitality which this famous institution offers, and at the same time the very exclusive, and, so to speak, aristocratic circle to which it appeals. Under the letter A we find listed in succession pupils from Constantinople, Athens, Algeria, England (Whitchurch), and finally Paris; while on the other hand, many of the courses of lectures (or, more strictly, *conférences*) are attended by only three or four pupils, fortunate alike in the high distinction of the scholars to whom they listen and in the intimate personal intercourse which they enjoy. For this there is no parallel in the United States nor in Germany, and hardly in England, where the college tutor or coach belongs to quite another rank in the intellectual world from the great names of Maspero, Gaston Paris, Henri Weil, Oppert, and Monod. The moral of this for us Americans seems to be that the very highest class of educational work is expensive, as well as exclusive, and cannot be done wholesale. A lecturer to six hundred, or to one hundred, young men cannot possibly be doing this class of work—his leverage is at an immense disadvantage; it diminishes with the square of the number who attend. Another interesting feature is that the women have invaded these domains of the élite, and, indeed, have conquered them; for, in several cases, they receive the compliment of honorable mention.

—The volume is introduced by M. H. Gaidoz, in a little dissertation entitled "La Réquisition d'amour et le Symbolisme de la pomme," the manner of which reminds one that, in treating of the humanities, the French scholar seldom forgets or ignores men and women. In this essay, M. Gaidoz ranges lightly from Ireland to Tahiti, and explains why the sportive Galatea of the Eclogues and the Cleariste of Theocritus pelt their favorites with apples. Irish maidens and Irish fairies practise the same classic rite; the modern Greeks retain it, and along with it the special compound μηλοβολεῖν. The custom gave rise to many pretty scenes on Greek bas-reliefs and to certain groups of the figurines. The apple, as a symbol of love, was, of course, assigned to Aphrodite and to Venus, and is transferred from these, in Christian art, to the Virgin, by an irreverent but familiar superstition—the more easily because of the parallel and contrast with Eve. However, the apple is by no means the only fruit employed in this lover's game. The sirens of Tahiti fling at bathers who please their taste the *nono*, a fruit as big as the fist and of rather unpleasant odor; yet, these girls know nothing of Galatea nor of Condla and his fairy mistress. The archæologists explain all this by the remark, "The apple is the symbol of love." But the young women in Ireland and Greece and Tahiti do not concern themselves with symbols; they follow custom—they aim at simple and practical results, viz., to entice and provoke the attention of a lover. They fling an apple as they might a flower; but the apple carries farther, and is good to eat. A quince or a pomegranate will do as well—the choice of the fruit depends on the climate. So the Tahitian damsels use their native *nono: Amor arma ministrat.*

—In a recent number of the *Astronomische Nachrichten*, Dr. See of Washington publishes a preliminary investigation of the diameter of the planet Mars. He has made careful and systematic inquiry into all previous researches on this important constant, attentively studying every determination of the diameter made during the nineteenth century, recalculating several series of observations in order to render the available material more complete, and applying a more thorough treatment to the observations in order to effect an improvement in them. The earliest seventeenth-century measures, by Grimaldi and Huygens, and those in the following century by Rochon, the elder Herschel, and Schroeter, are particularly interesting. Lemonnier, 160 years ago, by reducing certain observations made a century earlier by Huygens, seems to have come singularly near the true value. Dr. See brings out with marked prominence the systemic difference between the diameter of Mars as found by the heliometer, or divided object-glass, and the micrometer, as ordinarily applied to the telescope; it amounts to more than a thirtieth part of the entire value, and signifies about 150 miles in the linear diameter of the planet. Dr. See inclines to a value very close to the heliometer determinations, and calls attention to the near accord of his final micrometer value with the individual results deduced by such standard observers as Campbell and Barnard, both at the Lick Observatory. Correcting this for irradiation effects, he deduces the final value of 6743 kilometres, the error of which probably does not exceed one three-hundredth part of the whole.

—'A Vanished Arcadia,' by Mr. R. B. Cunninghame Graham (Macmillan), is the story, from first to last, of the Jesuit mission in Paraguay. It will be remembered that, during the early years of the seventeenth century, the Jesuits managed to convert a large number of the Guaraní Indians, whose unwarlike instincts made them docile and willing proselytes. The tribes of the Chaco and the Pampas were more turbulent, and never yielded themselves fully to Jesuit guidance, but the Guaranís were swept by the thousand into "reductions," where, isolated from intercourse with pagan natives and Europeans, they received an education both spiritual and secular from the missionaries. Seldom, if ever, has the experiment of bringing up men and women on the "sheltered plan" been carried out so systematically or on so large a scale. The success of this mission was a great triumph for the Jesuits while it lasted; and even when the enterprise failed, they must have found some consolation in the thought that their work was destroyed, not by an uprising of their converts, but by an edict which came from beyond the Atlantic. Mr. Grahame has travelled and lived a good deal in South America; indeed, the study of this subject seems to have been suggested by personal familiarity with the region of the Paraná. The literature of the Paraguayan mission is already extensive, and it has not been difficult for the author to

procure a large number of contemporary works which supply the necessary data. But, although the volume is by no means deficient on the side of research, its chief interest is due to Mr. Grahame's dashing and characteristic style. The evils of unrestricted competition, the brutality of the Saxon race, and the merits of a society which is uncontaminated by the taint of manufactures—these and other subsidiary matters of a similar kind receive their share of spirited, picturesque denunciation. Mr. Grahame thinks that the Jesuits did well by the Indians, and developed the spirit of industry among them without appropriating its fruits to themselves. Moreover, he is inclined to lament the disappearance of a pastoral elysium. "It has been nobly said, 'that the extinction of the smallest animal is a far greater loss than if the works of all the Greeks had perished.' How much the greater loss that of the type of man such as the Indians whom the semi-communistic Jesuit government successfully preserved, sheltering them from the death-dealing breath of our cold northern life and its full, fell effects!" As a piece of historical composition, this book shows wide reading, and it is written with a vigor which is quite unshackled by regard for conventional ideas.

—A publication of an absolutely unique sort is the portfolio of plates issued by the Paris house, Librairie de l'Art Ancien et Moderne. The author, Alexandre Sandier, is well known to the artists of New York, for he was here acting as assistant, first to an architect and then to a great decorating house, prior to the year 1872, and has been since that time within easy reach of us, in Paris. His singular gift of easy and swift design in a style peculiarly his own and quite independent of the traditions, while still he knew the traditions well and could give you a piece of decoration in any French epochal style from thirteenth-century Gothic to Louis Seize, was such that he could never be ignored; and such that, when we heard of his appointment to the artistic direction of the great national factory of porcelain at Sèvres, we were surprised only in so far that it seemed unusual that the ideally best man should have such a post. The book now issued by him is of a very technical character, and that is the reason for the brevity of its notice here. It is entitled simply '2,800 Formes de Vases,' and all it undertakes to do is to classify the recognized shapes by selecting the seven elementary outlines, combining and recombining these, and dividing the actual and possible shapes of hollow vessels into four series. The brief text explains that it was not thought necessary to go further, although quintuple and sextuple combinations are, of course, conceivable by any one. This analysis is carried through fifty-eight plates. The student will hardly expect to find all the forms beautiful. The author himself, veteran designer that he is, would be the first to urge that beauty of design is not the first thing sought for here, and, moreover, that it is not by analysis, and by cold reasoning-out of possibilities, that beautiful design is obtainable. What we have is, then, a seemingly exhaustive analysis of the possibilities of form along certain recognized lines of build and make. Thus, if we turn to plate 44, we shall see, ranged along the top, five drinking glasses of kindred forms, but differing from the tall and slender goblet almost like the old-fashioned "flute" down to a broad and shallow *coupe*, which outdoes in these two directions the flattest champagne glass of our own time.

BALFOUR: STEVENSON: HENLEY.

The Life of Robert Louis Stevenson. By Graham Balfour. 2 vols. Scribners.

It is always painful—even, we imagine, to the most resolutely philosophical observer of human nature—to see what happens when a great writer lays down his pen for ever. And the distress of the spectacle is aggravated if the *man*, as well as the *writer*, has endeared himself to his readers or otherwise impressed his personality upon their imagination. The outburst of praise and lamentation—as undiscriminating and communal as the songs of the women mourning for Thammuz—is not the melancholy thing; for that is natural—it is of the heart and not of the mind. We have lost one whom we loved, or who was of value to us, and our sense of deprivation takes rude shape in the immemorial reproach, "Why would ye die?" Even the critics lose their heads—as they ought, if they have hearts—and for a season nobody knows whether they are appraising their hero as a stylist or stretching out vain hands in longing toward the other shore. There ensues the recovery: the tumult and the shouting dies, and reason emerges from the contagious clouds This, too, is nothing to be sorry for. "After great storms the calm returns; and pleasanter it is thereby!" But now begins the real post-mortem tragedy—the family quarrel over the dead man's will. Our author has bequeathed us his reputation. That is our inheritance; we must not let it deteriorate; there must be neither strip nor waste. But what is the value of the estate? The inventory was made in haste. Perhaps it is too high. We fear it is—but no man must be allowed to say so. The metaphor is a poor one, but does it not signify the fact? Why should we be careful and troubled to deny the course of time—to maintain in the court of the logical conscience what was at first asserted in terms of the funeral chant? Here inconsistency accords with the truth of human nature, and is far more consistent than stubbornness itself.

Never, perhaps, has there been a more horrid outcry than that precipitated by Mr. Balfour's biography of his kinsman. It is a modest book. The very preface might disarm the doughtiest: "I wrote it," says Mr. Balfour in substance, "because Mr. Colvin was not very well, and because I knew my cousin intimately." And it is a guileless book, and gentle enough, in all conscience. It proffers no challenge. It accepts its hero as genuine, and worships him with reverence; but there is nothing dithyrambic in the ritual, nor is the adoration blind. Stevenson had his faults, says Mr. Balfour, and passes on to speak of his virtues. There were failures in his life, but let us rather dwell upon his triumphs. It is a discreet book. Scraps from Stevenson's inedited papers are published—they are even advertised, quite properly, as a "feature"; but Mr. Balfour takes pains to point out that they are printed not as literature but as autobiography. If he lets us see that he admires them, he does not try to dragoon us into applauding with him.

Let us take this 'Life,' then, for what it professes to be—a supplement to the 'Letters.' Doubtless it is not an altogether inevitable supplement. The 'Letters' themselves, with Mr. Colvin's notes, might possibly have sufficed. At all events, their publication, two years ago, left only gleanings for him who was to follow; and this was the reason, perhaps, quite as much as uncertain health, that deterred Mr. Colvin from acting as his own successor. Yet the gleanings are worth while; the book is easy and pleasant to read; we owe gratitude to Mr. Balfour for what he has done, and likewise for what he has declined to attempt. It is an official biography, no doubt, and it bears marks of the discretion that befits official utterances. But a long-suffering public, sated with literary gossip, will hardly find fault with a biographer for refusing to be indiscreet.

Yet there is an eminent critic who is no friend to discretion, and in whose code reticence is tantamount either to cowardice or to insincerity. It is Mr. Henley, and we are all familiar with his militant creed. He was Stevenson's friend for many years, and it is not admissible to question the sincerity of his attachment. A shadow fell upon their friendship, and death has deepened the shadow, or, rather, "official biography" has deepened it. Something will not suffer Mr. Henley to sleep; the tongue no man can tame; and now there is a printed utterance, for all the world to wonder at, in the December number of the *Pall Mall Magazine*. It is the strangest manifesto, full of dark oracles. A copy of the author should go with it—no smaller gloss will serve. Three things we know it contains, for Mr. Henley says they are there, and says it expressly, in so many words: egotism, garrulity, and a grievance. The first two ingredients are harmless enough; they are even amusing. The grievance is a parlous matter. It sets us guessing when we have no business to guess. And guessing is facile and always unjust: thought is free. But there are other components in this pronouncement with the triliteral title. They are not easy to name, nor always pleasant to mention. There is spite—or is it *saeva indignatio*, or perhaps only much ado about nothing? There is pathos, and bumptiousness, and lingering regret; there is something like envy—"the robe of those that climb up higher to scorch"; there is candor; there is honest impatience of humbug and too keen a scent for humbug; there are *lacrimae rerum*, and other tears, of bitterer taste, which we may not analyze. There is jar of the nerves, and there are lyric memories of moments long swallowed up in the backward and abysm of time. And through it all there is innuendo, which he who runs *will* read. It is heavily dashed with that irritating figure against which Hamlet warned his friends when they had seen the ghost—the figure which the descriptive pathology of literature takes pleasure in naming *aposiopesis:* "We could, an if we would!" Mr. Henley once called Moore's Anacreon "a translation into scented soap"—a phrase for which, it appears, the gods have not forgiven him; for they condemn him in this essay to speak of Mr. Balfour's figure of Stevenson as "this Seraph in Chocolate, this barley-

sugar effigy of a real man." Heavy punishment—to have such tropes fly out of one's mouth instead of winged words! Mr. Henley reads Artemus Ward, or used to read him. It were not blasphemy to hope that he may some day remember a stanza of Whittier's, which, in emulation of his aposiopetic hinting, we leave unquoted, lest we may seem to be censorious or to "take upon 's the mystery of things."

Stevenson the Man is Mr. Henley's subject. He says little of the literary artist, and what he says, though corrective and salutary to the undiscriminating, of whom there are many, changes nothing in the sober expressions of those critics who have weighed their words. There were two Stevensons, he tells us—an earlier and a later, and the later had too much of the catechist in him—"the shorter catechist" of the sonnet, whom Mr. Henley has never fancied. In his own mind, the essay is doubtless a vindication, the assertion of a masculine actuality in contrast with an effeminate ideal. Yet to the running reader it seems like an assault, and so it has been treated, pardonably but unjustly. For such injustice, however, the essayist has himself to blame. A hectoring manner brings its own punishment. Still, Mr. Henley always knows what he is about. He looks for no indulgence, and we shall not affront him with further exegesis. What he has written, he has written. "He has done the state some service, and they know it"; at all events, they will come to know it as time elapses and irritation fades.

What has followed is the pitiable thing. All England rings with the sound of it, and America reëchoes. Epithets are bandied about. Motives as ignoble as unmixed jealousy are ascribed with freedom. Mr. Henley has been vociferously denounced as "a literary leper," and more pointedly as "the candid friend." Starved parodies have put forth their heads, hissing. It is even reported—perhaps "announced"—that Mr. Colvin is to issue a counter-statement. This we hope is not true. Everything has been said, or threatens to be said. We wonder only that no one has thought of applying Mr. Henley's own words written elsewhere—a truculent passage, in which he declares that a certain great one's "character and achievement" are "extraordinary," and adds, "Neither can be explained, or shouted, or sniffed away." Meantime, we imagine Mr. Henley as "sitting tight" and enjoying the row—in which imagining we may do him as much injustice, for aught we know, as any of his barking detractors. One must take one's chances. And that is also true of Stevenson's reputation as a man and as an author. Neither will be saved (or lost) for "much speaking." Finally who can forget Chaucer's couplet?

"But al shal passen that men prose or rime:
Take every man his turn as for his time!"

SCHOOL AND COLLEGE EDUCATION.

American Traits: from the point of view of a German. By Hugo Münsterberg. Boston: Houghton, Mifflin & Co. 1901.

School, College and Character. By Le Baron Russell Briggs. Houghton, Mifflin & Co. 1901.

Professor Münsterberg now presents, in a more permanent form and to a wider public, the five papers recently published in the *Atlantic* and the *International Monthly*. It is not easy to invent an illuminating name for a volume that comprehends a comparative study of German and American ideals, education and politics, a criticism of American scholarship, and a critical survey of American women, so that Professor Münsterberg's rather vague and inexpressive title may well be the choice of despair. Two of his papers deal solely with educational problems, and a third, on "Women," touches the college woman most nearly. But it is not merely on account of their common academic interest that we have bracketed these essays with Dean Briggs's smaller volume. There is in the two books an inner resemblance of conviction that, in the present somewhat experimental stage of American education, strikes us as significant. Here we have two Harvard professors, the one a professional student of psychology, with a world-wide reputation in his field; the other peculiarly versed in that more informal study of the human mind and character for which one can imagine no spot on earth more productive than the office of a dean. Neither writer has been deterred by his academic position from speaking out his whole mind, for the Harvard tradition favors freedom of speech. A concurrence of opinion in the case of two such men has special weight, and we find them agreeing separately, and in the most forcible terms, on the disadvantages or rather dangers of certain tendencies in the "new education"—a phrase that is fast becoming as obnoxious as the "new woman." Certainly, the most serious innovation of the new education has been the elective system. Reaching up from the kindergarten to the school, reaching down to the school from the university, it is obviously in secondary education that it is likely to have the deepest effect. For, after all, one's habits of work, one's training in attacking distasteful drudgery, one's attitude, in short, to obstacles, is acquired in the school; the university can but take and mould as it may, but cannot make over the product of school-teaching and discipline. Professor Münsterberg's warnings are, therefore, directed most earnestly to those who control the school system.

His article entitled "Education" aroused much comment on its appearance in the *Atlantic*, though we do not remember that any one was able to gainsay its main conclusions. The gist of it is that it is the mission of school education to free the young from "the weight of chance desires," and not to encourage them to mistake those youthful yearnings for inspirations. Professor Münsterberg gives a most instructive picture of his own schooling at Dantzig. He tells us that, at its close, the matriculation examination which admitted him to the university was one that very few Harvard students who have entered the senior class would have been able to pass respectably:

"Our entrance into the university can thus be compared merely with the entrance into the post-graduate courses. . . . I reached thus, at the end of my school time, as a pupil of average standing, the scholarly level of an average college graduate in this country; I was then eighteen years of age; the average bachelor of arts is at least three years older" (p. 47).

Professor Münsterberg goes on to describe the outside interests, astonishing in their variety, for which he found time, as proof that overwork at school is not the explanation of the German boy's superior attainments compared with an American of like age. It is explained, he says, in part by the fact that

"the school never took the smallest account of those inclinations, and never allowed me to take the slightest step aside from the prescribed school work. . . . My school work was not adjusted to botany at nine years because I played with an herbarium, and at twelve to physics because I indulged in noises with home-made electric bells. . . . The more my friends and I wandered afield with our little superficial interests and talents and passions, the more was the straightforward earnestness of the school our blessing; and all that beautified and enriched our youth, and gave to it freshness and liveliness, would have turned out to be our ruin if our elders had taken it seriously, and had formed a life's programme out of petty caprices and boyish inclinations" (p. 52).

This, at any rate, is a negative explanation. But there were two positive factors, and, when he speaks of these, Professor Münsterberg touches a vulnerable place in the American armor.

"I had from my ninth year," he says, "no teacher in any subject who had not completed three years' work in the graduate school. Even the first elements of Greek and mathematics, of history and geography, were given to us by men who had reached the level of the doctorate, and who had the perspective of their own fields. . . . The most elementary teaching was given by men who were experts. . . . That was the secret in our German schools. . . . To bring that condition about must be the aim of every friend of American school life."

That this reform is a burning need, all will allow who realize that "only 2 per cent. of American school-teachers possess any degree whatever. If the majority of college teachers are hardly prepared to teach in a secondary school, if the majority of high-school teachers are hardly fit to teach in a primary school, and if the majority of primary-school teachers are just enough educated to fill a salesgirl's place in a millinery store, then every other reform is self-deceit" (p. 76).

Another positive factor was home influence. The German parent takes school work seriously. "The school had the right of way. A reprimand in the school was a shadow on our home life; a word of praise in the school was a ray of sunshine for the household." How many American parents take their sons' schooling as seriously as this? Inefficient teachers, indulgent parents, the extension of the kindergarten methods to the school—these are the three influences that sap the life of secondary education in America.

But it may be objected that we cannot adapt Americans to the German point of view. Let us consult Dean Briggs. Like his German colleague, he attacks the elective system from the kindergarten up and from the college down. The fundamental idea that education need not be forbidding is all right, but "no persons lay themselves open more recklessly to *reductio ad absurdum* than advocates of the elective system." Election of studies must of course come at some point in all higher education; but where to begin? It is or should be clear that we begin too early when we invent devices to delude children into thinking they are playing games, though we are really teaching them harmony by means of a story called "Major C and his Relatives," or the distinctions of nouns, verbs, and adjectives by the analogy of sparrows,

robins, and hens. Such methods, which are closely allied to the elective system, ought to offend the intelligence of any child of sense. "Debilitating" is a mild word for these painless methods. No one can attain power in any other of the tasks of life except by honest effort to overcome difficulties. Work along the line of least resistance is bound to produce a student "flabby of mind and will." When one so trained, or, rather, so enervated, comes from school to college, what is his attitude to those limited doses of prescribed work that even the advocates of the elective system would maintain? In the first place, the prescribed subject must be easy because the student has been trained to think that one ought not to be forced to take a difficult subject unless one likes it. Mr. Dooley has grasped the situation: "Th' prisidint takes him into a Turkish room, gives him a cigarette, an' says, 'Me dear boy, what special branch iv l'arnin' would ye like to have studied f'r ye be our compitint professors?' "

What is the general result in college life? Dean Briggs emphasizes even more strongly than Professor Münsterberg the lack of training that results. "To set work above whim—that is training"; and in the case of the college student there is "a complete uncertainty as to whether he will be trained or not." Only in athletics can the student who has grown up under the elective system find opportunity for discipline; it is only there that there is short shrift for the man that shirks. The opéra-bouffe view of college life, encouraged by many parents and by most students, the certainty that cutting lectures will be taken as a sign of spirit, while regular attendance will not—these influences often find their only corrective in college athletics. Dean Briggs says that he would take the elective system out of the grammar school, and that he is "not attacking it in colleges"; but the whole tenor of his paper goes to support Professor Münsterberg's conviction that

> "the higher the level on which the professional specializing begins, the more effective it is," and that, "even in the college, . . . election with reference to the later occupation usually plays a secondary rôle; liking is the great ruler . . . Even in the college, two-thirds of the elections are haphazard, controlled by accidental motives."

In his article on "Scholarship," Professor Münsterberg points out that the condition of productive scholarship in America is not satisfactory. In Germany it is the essential interest of all university activity; in America it is "an accessory element, a secondary factor, almost a luxury." It is certainly true that the best men in the country are not attracted to the scholarly life. The incentives of high social standing and large salaries that draw the best minds of Germany to the scholar's pursuit, are lacking here. Those who enter on a professorial career are driven to do work that will pay, and productive scholarship goes to the wall. Professor Münsterberg's insistence on the necessity of printing the doctor's thesis, and of keeping the ambitions of the younger men fixed on scholarly aims, is decidedly at variance with the recent utterances of Dr. Kekulé, the rector of the University of Berlin, which were lately noticed in these columns. The German professor who knows us best tells us that we have too little scholarship; the other warns us from Berlin against having too much—as though one should set forth to the starving the disadvantages of a rich table. When we shall have reached the German level of productive scholarship, and have so adjusted the emoluments and social premiums of the scholarly life as to attract the best brains in the country from Wall Street to the college campus—when the splendid endowments of Mr. Carnegie and others shall have achieved this result, it will be time to pause and weigh the risks of too much scholarship. Dr. Kekulé tells us to be content with the technical school. We imagine that Americans are more likely to heed the advice of Professor Münsterberg not to allow American scholarship to remain "inferior even to American poetry and architecture" (p. 126).

Professor Münsterberg's views on "Women" are not likely to pass unchallenged, and we have not here the space in which to meet them fairly. His admiration of the American woman is limited only by his anxious forebodings of her too complete and independent success. He says some very definite things about her "passive and receptive mind" (charming in its place), as compared with the masculine intellect; and prophesies that unless men do something drastic the whole realm of art and literature, as well as some of the learned professions, will slip through masculine fingers. The "effemination of culture" will be the dire result. Of all the arguments against the higher education of women that we have encountered, this is the most obviously double-edged. Where, then, is the advantage of the superior strenuousness and power of the masculine mind? If it is doomed to fail to control the destinies of art, literature, and the learned professions, if it supinely suffers the emasculation of all that tends to raise the level of civilization, the mind of the American man might just as well be "passive and receptive" as not, since in passivity and receptivity lies success.

We leave the doubts here raised as to the advisability of coeducation in the American universities to its proper champions; but we may be allowed to point out that when he exhorts those homes of learning to become, "like European institutions, places for men, where only the exceptional women of special talent can be welcomed," Professor Münsterberg appears to neglect the fact that there are 600 women studying this winter at the University of Berlin. Have they all special talent? And if not, what about the effemination of Berlin? It appears that the German universities also are threatened with that "loss of virility" that Prof. Barrett Wendell once feared for Harvard.

Among the undesirable tendencies fostered by college life for women, Professor Münsterberg reckons a disinclination for marriage. The burden of proof that her college training renders the prospect of home duties (in a home of her own) distasteful to the average woman, lies with those who make the assertion. Statistics are valueless here, and must be so for many years to come. Professor Münsterberg has weakened the argument by his statement that the "anti-domestic" tendency draws away quite another class of women in this country "from the hearth to the mill and the salesroom," and is "not less evident in the lower strata of the community." Why, then, blame the college? Why not admit the truth, for America as for Germany, that a million women at least have no choice but to ignore the possibility of marrying, and must turn to work outside the home as a measure of self-preservation? In any case the peculiarities (if they exist) of the college woman can have strikingly little effect on the general course of American civilization. And if Professor Münsterberg will stand by his assertion that a college education does not make a woman herself less attractive, he need not lie awake over the problem of converting her to the attractions of the home. As for her alleged disillusion on finding that she can beat a boy at his lessons, women are rather prone to find stupidity endearing. Look at the stupid heroes of Mr. Henry James, and observe the devotion to them of the clever heroines. This question of intellectual priggishness as a bar to matrimony was long ago handled lightly and lightly dismissed by Mr. Charles Dudley Warner in 'A Little Journey in the World' (p. 38), where Professor Münsterberg may see his own theory expressed almost in his own words, but without his serious deductions.

We have dwelt on Professor Münsterberg's papers on education and the allied problems because we consider them the most interesting and significant of the series. The remaining chapters, on "American Democracy" and "The Americans and the Germans," are both entertaining and enlightening, and will commend the book to a still wider class of readers.

In his articles entitled "Fathers, Mothers, and Freshmen," and "Transition from School to College," Dean Briggs discusses the relations of parents to their undergraduate sons, and discloses some of the difficulties that beset a Dean. That for the improvement of the relations between the undergraduate and his college advisers, the latter must look to the parents for essential assistance, is made plain by the experiences here detailed. The weight of home influence, the underhand dealings of many parents with both the college and their sons, are factors that have to be met and overcome. The advice to parents in this little volume would, if taken to heart, save many a father and son from a false conception of college life as an opportunity for four years of irresponsibility before the real work of life begins. The language of Dean Briggs is forcible and occasionally embittered by the experience which has fitted him to give so much excellent advice.

SOME RECENT BOOKS ON LINEAR PERSPECTIVE.

Linear Perspective, Adapted for Colleges, Schools, and Teachers, and for Self-Instruction; including Examples in Parallel, Angular, and Oblique Perspective. By Edward T. Cooper. 11½x15¾ in.; 2 pp. text; 28 double plates, each with text and on cardboard. Cleveland, O.: Lamson & Carpenter. 1901.

Applied Perspective for Architects and Painters. By William P. P. Longfellow. 8x 11 in.; ix, 96 pp.; 141 illustrations, partly in text and partly in 33 plates. Boston: Houghton, Mifflin & Co. 1901.

Modern Perspective; A Treatise upon the Principles and Practice of Plane and Cylin-

drical Perspective. By William R. Ware, Professor of Architecture in Columbia University. Text, 5x7½ in.; viii, 396 pp., with 30 plates each 11x15 in., in a separate portfolio. The Macmillan Co. 1900.

A knowledge of linear perspective is of such direct practical value in the graphic arts that the teaching of it must always occupy a place of considerable importance in any well-arranged course in drawing. In technical schools, where the students, as a rule, approach the subject well grounded in plane and spherical geometry, and often fresh from a course in analytic or the more immediately related descriptive geometry, the teaching of linear perspective, even in its higher branches, is not a difficult task. But in schools of art the case is a far different one. Few of the students have advanced beyond the grammar grade of the public school. Most of them lack the rudiments of geometry. Not a quarter of them can define an octagonal prism. Confused ideas of the meaning of such words as vertical and perpendicular are constant stumbling-blocks. Even though the careful teacher should, before entering upon his proper subject, attempt to lay a foundation of elementary geometry, he finds his pupils' minds so unused to the nice accuracy of mathematical expression that he at once realizes, as the students themselves cannot, the grave disadvantage under which they labor in their struggle to master a subject which, though of use in the fine arts, is, in fact, a branch of one of the exact sciences.

To make the subject clear to the understanding of such students is the purpose of Mr. Edward T. Cooper's 'Linear Perspective.' In spite of its rather pretentious title, which reminds one of Mr. Blaine's historic phrase, "Claim everything," the book covers but a narrow field. With the more intricate problems of the subject it does not concern itself. With the theory of perspective the book has little to do. Its keynote is simplicity. To teach plain and practical methods of solving the more usual problems is its end. This it does by a series of diagrams presenting not only the elementary principles of perspective, but their application to such simple figures and solids as will least confuse the beginner. The book contains ingenious illustrations, in which, by means of lines ruled on photographs, the position of the horizon, centre of vision, vanishing points, etc., are very clearly shown. Among these the best form a series of photographs, in which a table covered with squares of black and white paper arranged as a checker-board is shown, first, with its sides at right angles to the picture plane, and consequently with its retreating lines converging at the centre of vision, while the diagonals of its squares vanish at the distance points; secondly, as set at an angle with the picture plane, thus illustrating the relation of the vanishing points for systems of lines at right angles with each other; thirdly, in the same position, but with many of the paper squares lying upon it in accidental positions, showing that each of these has its own pair of vanishing points, yet all upon the horizon. Although the amount of matter contained in the book is small, the great size of its plates (15½x20 inches) gives it an advantage in simplicity of presentation, since the sundry points are actually put upon the page and do not have to be imagined at a distance beyond its margin, as is so often the case. In places, the text lacks scientific precision—a defect which may have arisen from a deliberate choice of familiar expressions intended to avoid the use of terms less readily comprehended by the untrained mind.

Mr. W. P. P. Longfellow, in his 'Applied Perspective,' approaches his subject from quite a different point of view from that of Mr. Cooper. From the fact that he does not exclude the more difficult problems, his book, or rather its latter half, has an apparent intricacy that is due to the subject rather than to the author's way of handling it. Mr. Longfellow points out at starting that "the practice of perspective depends not so much on many principles, as on the varied application of a few," and that it is an easy matter for a man of fair capacity to acquire enough for every-day use. Instinctive readiness of resource to solve varied and intricate problems as they appear, he finds to be the distinguishing mark of the skilful draughtsman. He therefore devotes the first half of his book to those simple principles necessary to qualify the student for work of ordinary difficulty, while in the second he discusses such problems as the draughtsman must be prepared to solve if he is to be accounted thoroughly skilful.

As its title shows, the author is concerned with the *application* of the principles of perspective to actual work, yet he has by no means overlooked the necessity for carrying the theory of the subject along with the practice. Permitting himself an abundance of words, and nowhere attempting "to adhere to the rigorous forms of theoretical mathematics," he is able to make his subject far clearer to the average understanding than he would have done by such adherence. His method permitting whatever digressions may please his fancy or contribute to a readier understanding of his subject, he indulges in them, here and there, with good effect. In the first place, instead of defining the horizon as the intersection of the picture plane with a horizontal plane passing through the spectator's eye (a sufficiently accurate, but to the beginner by no means luminous statement), Mr. Longfellow begins by discoursing upon perspective in nature, describing the horizon at sea, and showing that this horizon is in appearance always just at the level of the eye, and that whether we sink our eye to the level of the sea, or go up even to a great height in a balloon, the horizon follows us, and seems always at our own level. So interestingly does he discourse of this phenomenon, and of the curious consequences that arise from it, and of the frequent disregard in paintings of the limitations it imposes, that we are carried into the midst of the subject without realizing it, and presently find ourselves occupied with an equally interesting discussion of the distinction between foreshortening and mere diminution in size on account of the distance of the object. From this it is an easy passage to the question of why and where lines vanish in perspective; but so informally is the introduction treated that the foundation for all that follows is laid before we suspect it.

Without going into detail, suffice it to say that at certain points the presentation of the subject seems quite new, and that, in general, there is a freshness about the author's manner that serves well to maintain the reader's interest. This is notably true of the chapter upon the use of perspective in the construction of pictures, and in the chapter upon the many singular and unpleasant distortions in the forms of objects resulting from a rigorous application of the rules of perspective, when not accompanied by a judicious selection of the point of view and a reasonable modification of certain resultant forms.

In closing let us note that Prof. William R. Ware's 'Modern Perspective' has recently been republished, and that thereby an opportunity has been given to add to the book a discussion of a few subjects not included in the original edition. 'Modern Perspective' is a work of an essentially different character from either of those that we have been considering. It assumes a thorough preparation in mathematics on the part of the student. It wastes no words in making things easy for him. Its aim is to present the whole theory of the subject in the most thorough and scientific way. Some examples of the use of the principles are wisely included in the book, and thus in a certain sense it treats, like Mr. Longfellow's book, of applied perspective. Professor Ware's work has been too long before the public to justify any extended notice of it at this late day; enough that it is the most authoritative work upon linear perspective in the English language. For one who wishes to understand thoroughly the science of perspective, it is at once adequate and indispensable.

Present Irish Questions. By William O'Connor Morris, County Court Judge. London: Grant Richards. 1901.

The interest of this book to Irish readers will consist mainly in the fact that the author is a judge whose duty is to administer impartially the laws which he so roundly condemns as unjust. It is well known that most of the judges and highly placed and paid officials in Ireland hold very similar views, but they do not parade them in public, however much they may allow their decisions and actions to be influenced by their prejudices and convictions.

Judge O'Connor Morris is a landlord, and has been from his youth to his now advanced age a Tory pamphleteer, press-writer, and author of many works similar to this. His views with regard to the actual state of Ireland may appear, he says, "gloomy and paradoxical." The latter they certainly are, especially on the land question, which occupies the greater part of the book. The land system of the past he describes as essentially bad, inasmuch as the joint ownership and concurrent rights of the Irish tenant with his landlord in the soil did not receive, as "it was but just they should," the recognition and sanction of the law. Nevertheless, the attempts of the Legislature during the last thirty years to recognize the Irish tenants' concurrent rights meet with the Judge's unqualified disapproval; they came too late; they were wrongly conceived, and have resulted in confiscation pure and simple of the landlords' just rights. These are paradoxes indeed—what should have been done sixty years ago is rank injustice now. A wail about confiscation pervades the whole book, but the term has application only to the estates of landlords. It is confiscation to reduce the rents receivable by landlords

by the value of the improvements made by the tenants, but it was not confiscation for the landlords to raise the rents as the tenants' improvement works made their farms more valuable.

More than half the book is taken up with the oft-repeated story of the Irish land laws, including illustrations in detail of their iniquitous effects upon the landlord class. The result is thus stated in chapter i., describing Ireland in 1901: "The attempts that have been made to reform the Irish land system in the last sixty years, have been, with scarcely an exception, failures." The book itself suggests the reason, and the reply—that this is so because the administration of the reforming measures has been intrusted to such judges as the author. Act has been piled upon act, during the last thirty years, with the main object of trying to secure to the Irish tenant those "concurrent rights," that "joint ownership," to which Judge Morris says he was justly entitled. But the Irish judges, drawn almost invariably from a class hostile to all reform that touched the pockets or privileges of their class and creed, have invariably evaded and nullified the law. Judge Morris's testimonial to the present head of the Land Commission (p. 224) is as good an illustration of the feeling prevalent in the Irish courts and among the judges as could be—"a capable and experienced lawyer, he has done probably as much as in him lay to alleviate some of the wrong done to Irish landlords." That is to say, the law has been wrested, its plain meaning perverted, in the interest of landlord suitors, and the tenants have been deprived of what the Legislature intended they should have, the ownership of their own improvements.

Home Rule, Judge Morris thinks, is by no means dead. It is a "present Irish question," and is inconsistently attributed to a foreign conspiracy against the State, and to the shifty, vacillating, unprincipled administration of Ireland by England. Signal ignorance of Irish affairs has been the characteristic of English legislation and administration. He quotes with approval O'Connell's statement, "We are governed by foreigners; foreigners make our laws." The Home Rule bills of 1886 and 1893 are exhaustively and acutely examined. Every plan proposed is fraught with danger. Separation would be preferable; but also worse, for "illiterate, indigent multitudes, an ignorant priest-ridden democracy," would work ruin to themselves; an Irish Parliament "would trample on and oppress hundreds of thousands of law-abiding men." The independence of the poorest country in Europe at the door of the richest would be impracticable.

The chapter on the financial relations of Ireland and England is a bit of vigorous writing. There are no two sides to this question, in Judge Morris's opinion. The report of the Childers Commission that Ireland is overtaxed to the amount of two or three millions sterling a year, falls short of the real truth; the arguments of the present Government and their supporters against this conclusion are "a compound of absurd and offensive insolence." "Is it a seemly sight, is it becoming in the eyes of the world, that the richest country in Europe should practically impose an iniquitous burden upon the poorest?" The sum of the whole matter is that the Irish landlords must be compensated for the huge confiscation made of their property; their rentals must be kept up, their taxes remitted, and their class preserved in all its privileges to govern and administer the affairs of an ignorant and ungrateful democracy. The recent reform of the system of local government is not altogether pleasing to Judge Morris. The whole scheme "will ultimately have to be reformed, in a conservative sense, if things in Ireland are not to be left upside down." This upside-downness consists mainly in the principle that "a cottar has the same voting power as a man of forty thousand a year." Yet the cottar must pay the local rates, while the owner of a rental of £40,000 pays none.

As on the question of finance, so on that of education, Judge Morris takes the modern and popular view. Protestant ascendency ought not to exist in university life; and Trinity College, the only institution which can be called a university, remains "a Protestant institution, well endowed, almost a monopoly of the Protestant upper class."

Judge Morris is a practised writer, but we have had a good deal of the contents of this book in his former publications, and his denunciation of the Land, National, and United Irish leagues is only a development of his judicial orations on the bench, repeated at almost every session. These organizations are held responsible by him for every crime and offence, and even for accidents in the districts where he sits as a County Court Judge. In the abnormally dry spring of 1901, fires took place on moors and heaths in County Sligo, as they did also in Lancashire and Yorkshire, where they were far more extensive and destructive to land and game. But the United Irish League existed in Sligo, and the law in Ireland makes the district rate-payers liable to pay compensation for any such occurrence if the judge holds it to have occurred through malice. Judge Morris announced that fires could not occur at such a time of year except through malice, and saddled the ratepayers with enormous compensation, which was substantially reduced on appeal. This fire he describes (p. 30) as "a serious outbreak of agrarian crime, in the form of incendiary fires, which may be distinctly traced to the operations of the United Irish League." The law in the hands of such a judge holds out distinct inducements, often availed of, to persons to set fire to their own houses, hay, heaths, etc., and then to obtain from the ratepayers an extravagant amount of compensation.

'Present Irish Questions' is likely to give rise to some interesting debates in Parliament, for there is little doubt that a motion will be made to remove the Judge from his position on the ground that he is an unfit person to administer the laws which he has denounced and stigmatized as unjust.

NAPOLEON'S CAMPAIGN IN POLAND

By F. LORAINE-PETRE. With Maps. Demy 8vo, post free for 10s. 6d. net. $2.56.

"Full and accurate in matter, bright and crisp in manner, the work is a valuable addition to the histories of the Napoleonic War."—*Contemporary Review.*

"A most valuable addition to military history, and generally to our knowledge of this campaign of the great soldier. . . . We have read his book with extreme interest, and have a very high opinion of the masterly way in which he has assembled his materials, the skill with which he has balanced the opinions of various writers, and the ability with which he has brought out his conclusions. His narrative has the advantage of being written in an agreeable style, which makes the book attractive as well as useful."—*Army and Navy Gazette.*

AMERICAN GARDENS

EDITED BY GVY LOWELL AND ILLVSTRATED FROM PHOTOGRAPHS

To those who do not know what has recently been accomplished in garden-making in this country this book will come as a delightful astonishment; and showing as it does what can be achieved in America, and how existing conditions may be utilized, will prove a mine of suggestion. It contains reproductions of over two hundred specially made photographs which beautifully illustrate in detail sixty of our most charming private gardens, old (Colonial) and new, together with plans. The Introduction treats specifically of garden-design in America. Two hundred and thirty pages; 10 by 12 inches. Price, $7.50 net. Send for illustrated circular.

BATES AND GVILD COMPANY · PVBLISHERS · BOSTON

LIFE OF PASTEUR

Translated by H. C. Devonshire from the French of

R. VALLERY-RADOT.

"It is a great thing that a good life of Pasteur should be written, for there is no man of heart and intelligence who will not take fresh courage in his own work and a larger hope of his race from it. And M. Vallery-Radot has written a good life of Pasteur; good in its presentation of the man and his work; good as an animated and exciting story of adventures as surprising as those of travellers in strange unknown lands, of successes as stupendous as those of the conquerors of great nations. . . . M. Vallery-Radot has combined the strictest scientific accuracy with absolute clearness and charm. The reader of these pages, even if he begin with no scientific knowledge, will gain a clear understanding of the most complicated of modern scientific problems, and he will have the dramatic interest in learning of them in the order of their development."—*The London Saturday Review.*

ROBESPIERRE

By HILAIRE BELLOC, B.A.

Late Brackenbury Scholar of Balliol College, Oxford, and author of "Danton, a Study"

MR. BELLOC'S remarkably vivid presentation of "Danton" will prepare readers for the study of "Robespierre," with which he now follows it. This other great figure of the later phase of the French revolution is here depicted with the same graphic interest, and the different aspects of his character and career are discussed in the light of the latest data, which have only lately become accessible.

The Chicago Tribune says of "*Robespierre*": "It leaves as vivid an impression as Sardou's play. It is not the Robespierre of our school histories, but, after all, it may be nearer the real man than the description we parroted in our bread and butter days. . . . If Mr. Belloc can talk as picturesquely as he writes he would make a fortune on the lecture platform."

$2.00 *net*

THE APOSTLES' CREED

Its Origin, Its Purpose, and Its Historical Interpretation

By ARTHUR CUSHMAN McGIFFERT, Washburn Professor of Church History in the Union Theological Seminary

A CRITICAL study of unusual importance which is destined to command attention and provoke discussion. Its publication has been deferred to the present time because the author had reached conclusions at variance with many modern scholars which he did not wish to publish until he could give reasons for them in detail. These reasons constitute the greater part of the volume, and contain discussions of the most important questions connected with the origin, the text, the purpose and the historical interpretation of the creed.

$1.25 *net* (postage 13 cents)

THE GREAT PERSIAN WAR

AND ITS PRELIMINARIES

A Study of the Evidence, literary and topographical

By G. B. GRUNDY, M.A., Lecturer at Brasenose College

A RECASTING of the history of the Græco-Persian wars up to the end of 479 B. C. in the light of important discoveries made by the author in the course of his extensive topographical surveys of Thermopylæ, Plataea and Pylos between 1892 and 1899. Much destructive criticism, recently brought to bear upon the histories of Herodotus and Thucydides, is also examined in this new light. Freely illustrated with photographs and maps.

Bryce's Studies in History and Jurisprudence

8vo, cloth, $3.50 net. Postage, 27 cents.

"It is no exaggeration to say that no man living is better qualified to write upon these and kindred topics than the author of the 'American Commonwealth.' The essays are all distinguished by that careful, painstaking research, profound learning, and scrupulous fairness and impartiality that have given Mr. Bryce's previous works such remarkable vogue among the learned and cultured of both hemispheres. The study entitled 'Hamilton and Tocqueville' will undoubtedly possess peculiar interest for American readers."

Cloth, $2.50

Eight lectures on the Kingdom of God in the History of Christian Thought.

PATTEN

The Theory of Prosperity

By SIMON N. PATTEN,

Professor of Political Economy in the University of Pennsylvania, Author of "The Development of English Thought."

Cloth, $1.25 *net;* postage 11 cts.

A practical book in the best sense, uniting the discussion of economic theory and evolutionary doctrine as they have never been focused before.

KELLOR

Experimental Sociology, Experimental and Analytical: Delinquents

By FRANCES A. KELLOR,

Graduate Student, University of Chicago

Cloth, $2.00 *net*, postage 15 cts.

Presents new data as to whites and blacks, not only as to criminality, but as to social conditions, through a new method in sociological study.

MENPES

Japan

A RECORD IN COLOUR

By MORTIMER MENPES

Transcribed by DOROTHY MENPES

100 plates in Colours

Cloth, 8vo, $6.00 *net*, postage 24 cts.

Mr. Menpes, the distinguished artist whose records of the Boer Campaigns were issued last year, has charmingly memorialised in colours the lovely flower land of the Far East. His impressions are interpreted in equally charming text by his daughter.

CANFIELD

The College Student and His Problems

By JAMES H. CANFIELD, LL.D.,

Librarian of Columbia University.

Cloth, $1.00 *net;* postage 8 cts.

Helpful, witty advice drawn from a long experience as Secretary and President of the National Educational Association, Professor of History, University of Kansas, Chancellor of the University of Nebraska, President of the Ohio State University and at Columbia University.

Short, admirably written, sound, wise, and pertinent to most interests of student life.

GILLIE

The Story of Stories

By R. C. GILLIE

Illustrated. Cloth, $1.50

A simple life of Christ, fully illustrated and thoroughly attractive to children.

SHERMAN

What is Shakespeare?

AN INTRODUCTION TO THE GREAT PLAYS

By L. A. SHERMAN,

Professor of English Literature in the University of Nebraska.

Cloth, $1.50 *net;* postage 15 cts.

Aims to put people in a condition to see at first hand and of themselves the meanings that the best readers find in Shakespeare.

THE LATEST FICTION.

LINN

The Second Generation

By JAMES WEBER LINN

Cloth, 12mo, $1.50

A Romance of Chicago newspaperdom; the story of an old hate bequeathed by father to son; of how the latter is forced by it into a course against his nature and his hopes of happiness. A novel whose interest is frankly romantic, yet drawn from active everyday life.

THE MACMILLAN COMPANY, 66 5th Ave., N. Y.

LONGMANS, GREEN, & CO.'S NEW BOOKS

Typical Modern Conceptions of God:

or, The Absolute of German Romantic Idealism and of English Evolutionary Agnosticism. With a Constructive Essay.

By JOSEPH ALEXANDER LEIGHTON, Professor of Philosophy in Hobart College. 12mo. Crown 8vo, $1.10 net.

Last Essays.

By the Right Hon. Professor F. MAX MÜLLER, K.M. Second Series—Essays on the Science of Religion. Crown 8vo, $1.75.

Studies in Auditory and Visual Space Perception.

By ARTHUR HENRY PIERCE, Ph.D., Professor of Psychology in Smith College; late Kellogg Fellow at Amherst College. With Tables and 56 figures in the text. Crown 8vo. Pp. viii. + 361, $2.00 *net*. Postage additional.

A Practical Text-Book of Plant Physiology.

By Dr. DANIEL TREMBLY MACDOUGAL, Director of the Laboratories of the New York Botanical Garden, Bronx Park. With 150 Illustrations. Large 8vo, about 350 pages. $3.00.†

**** A book containing a discussion of the principles of the general physiology of plants with detailed directions for experiments arranged for demonstration and original work. Suitable for use in colleges and universities as well as by the private student or teacher in high schools. The treatment of the fundamental properties of protoplasm given, will be of interest to physiologists and biologists in general.

BY THE SAME AUTHOR

Elementary Plant Physiology

With 108 Illustrations. (Nearly ready.)

Introduction to the Study of Chemical Philosophy:

The Principles of Theoretical and Systematic Chemistry

By WILLIAM A. TILDEN, D.Sc.Lond., Sc.D.Dub., F.R.S., Professor of Chemistry in the Royal College of Science, London. TENTH EDITION (Fourteenth Impression), completely Revised and Rearranged. Fcp. 8vo, $1.75.

Directions for Class Work in Practical Physiology:

Elementary Physiology of Muscle and Nerve and of the Vascular and Nervous Systems.

By E. A. SCHÄFER, LL.D., F.R.S., Professor of Physiology in the University of Edinburgh; Author of the "Essentials of Histology," etc. With 45 Diagrams, 8vo, $1.00.

LONGMANS, GREEN, & CO., 91-93 Fifth Avenue, New York

None among living authors has made so profound an impression with a first novel as has

GEORGE DOUGLAS

with his

THE HOUSE WITH THE GREEN SHUTTERS

WHAT THE CRITICS THINK OF IT:

"A notable and, in a sense, tremendous book."—*Outlook.*

"A strong and impressive piece of fiction."—*The Bookman.*

"An uncommonly fine novel."—*Pall Mall Gazette.*

"Worthy of the hand that drew 'Weir of Hermiston.'"
—*London Times.*

"It has force, insight, intensity, and rousing humor."
—*Illustrated London News.*

"We are not far in the story before we are gripped by its power. . . . Done with brilliant vigor and undeniable power."
—*Glasgow Herald.*

". . . far and away the most original novel of the year, a work of profound power and genius."—*Harper's Weekly.*

"It will be read and talked of long after the historical novel of the day has been laid aside."—*Chicago Banker.*

$1.50

McClure, Phillips & Co.

New Putnam Books

WALES

By O. M. EDWARDS, Lecturer on Modern History at Lincoln College, Oxford. No. 62 in "*The Story of the Nations.*" 12mo. Fully illustrated, net, $1.35. (By mail, $1.50.) Half leather, gilt top, net, $1.60. (By mail, $1.75.)

The first adequate history of Wales in English.

HENRY V.

The Typical Mediæval Hero. By CHARLES KINGSFORD. No. 34 in the "*Heroes of the Nations.*" 12mo. Fully illustrated, net, $1.35. (By mail, $1.50.) Half leather, gilt top, net, $1.60. (By mail, $1.75.)

SOCIAL ENGLAND

A record of the progress of the people in religion, laws, science, learning, art, literature, industry, commerce and manners from the earliest times to the present day. By various writers. KING EDWARD EDITION. 6 vols., containing 2,500 illustrations and numerous colored plates. Edited by H. D. TRAILL, D.C.L., and J. S. MANN, A.M. Large 8vo. Net per volume, $4.50. Vol. I. now ready.

"A stupendous undertaking," the London *Times* characterizes this work. It belongs among the monumental works of history. It is a most valuable companion to Green's "History of the English People," and is a fitting library mate to the illustrated edition of that set.

G. P. Putnam's Sons

NEW YORK and LONDON

The Nation.

NEW YORK, THURSDAY, JANUARY 23, 1902.

The Week.

A tea-pot revolution is raging at Panama, but it is nothing to the revolution of sentiment in this country marked by the unanimous report of our Canal Commissioners, transmitted to Congress on Monday, in favor of the Panama route for an Isthmian canal. This is whole diameters away from what passed for even expert opinion three years ago. Within that period, Admiral Walker, who now signs as President of the Commission, publicly expressed his disbelief in the engineering practicability of a canal at Panama at all. And, of course, to the perfervid Morgan, a Panama canal has all along been as wild a project as a railway to Nephelococcygia. His attitude of mingled indignation and pity, when confronting any man who ventured to say that there might, after all, be something in the Panama scheme, was typical of that of press and public until within a year. A newspaper capable of presenting the arguments for the southerly route was held to be *ipso facto* wrong in the head, or else bribed by "French gold" ("British gold" having given out). The canal is not yet dug. Even a bill to authorize it may not be passed at this session of Congress. As to that we make no prophecies. But the one thing certain is that no Nicaraguan bill will become law. The House will be allowed to enjoy a monopoly of folly in having rushed the Hepburn bill through without waiting for the facts. In the Senate (and in the House, too, when the matter comes up there again) there will be the careful deliberation fitting for full-grown men. We shall have common sense, not waving of the arms and shouting, applied to the great question of a waterway for commerce across the Isthmus.

A Pan-American agreement on international arbitration had hardly seemed possible at Mexico, so that the news of a general adoption of the Hague Convention by the American republics comes as a happy surprise. It is agreeable, also, to note that our delegation played an efficient part in soothing jealousies and composing differences. We know, of course, that the Hague Convention is more of an aspiration for peace than a sure means of guaranteeing it, and adhesion to it by the nations of the New World does not mean the end of war here any more than it does in Europe. Still, it is a distinct moral advantage to have this implicit condemnation of war on record so solemnly. It will prevent international disputes from being wantonly embittered. It will provide a tribunal before which an honorable adjustment of controversies may be had. It will increase the presumptions against those who talk of war, and heighten the guilt of those who provoke it. All told, the outcome is most fortunate, and will do much to avert from the Pan-American Congress the reproach of failure, which otherwise might have been levelled at it with considerable justice.

President Roosevelt continues to win the highest praise from respectable citizens in the South for his rejection of unfit candidates for Federal office who are pushed by the Republican machine of their State, and his insistence upon high-class men, even if he has to go outside of his own party to get them. In pursuance of this policy, he has recently nominated two of the most prominent Democrats for two of the most important positions under the United States Government in Mississippi—the district attorney's office and the marshalship. Each appointee is, by common consent, honest, able, and public-spirited, and the reason the President took them was because he could not find men of such character and attainments among the Republicans of their district. Mr. Roosevelt's action receives the warmest commendation from the leading newspapers of the region. The New Orleans *Times-Democrat*, for example, holds that "this determination of Mr. Roosevelt's to subordinate partisanship to patriotism touches the high-water mark of political courage yet recorded in the history of this country," and it adds:

> "We believe we reflect the sentiment of Americans of the Southern States when we say that this unflinching determination of the President's to conduct his Administration in accordance with the primal laws of human living, has won the profound and widespread admiration of his countrymen at the South. If Mr. Roosevelt's Administration as President should end to-day, it would, by its Southern policy alone, be entitled to the lasting gratitude of all Americans."

It is surprising, however, to find the same President who thus unhesitatingly "turns down" the Republican machine in a Southern State seemingly complying with its demand in Pennsylvania. Mr. Roosevelt has announced that the present Collector of Internal Revenue in Philadelphia, P. A. McClain, will be replaced by William McCoach, although Mr. McClain has been a most efficient Collector, and although Mr. McCoach has no other qualifications than subserviency to the Quay machine. According to the New York *Times*, the President justifies this extraordinary performance by the plea that Mr. McClain ought to be put out because he bolted the regular Republican ticket at the recent municipal election, and because officials "must be not only good men, but stalwart Republicans." As thousands of decent Republicans revolted against the outrageous ticket nominated by the Republican machine in Philadelphia last fall, this punishment of one of them astonishes everybody. Mr. McClain himself puts the case very well when he says: "My espousal of the cause of decent municipal government was in direct sympathy with the many utterances of President Roosevelt on the subject; and it does not seem consistent that he can remove an official who agrees with him as to public morals, to take up any representative of a political combination which has been at absolute variance with him as to public morals." Why may Mississippi be granted the best officials who can be secured, even if it be necessary to take Democrats, while only "stalwart" Quay men can hold office in Pennsylvania?

It is semi-officially explained on behalf of the President that the reason for the Collector's removal was not the fact that he had voted a bolting ticket, but that he had taken an active part in the campaign, appearing on the stump upon occasion. This was in defiance of a warning which he had received from Washington, that such activity was incompatible with the Administration's policy as to the civil service. A similar warning was administered to another Federal official, who wanted to speak in favor of the Quay machine—and was heeded by him. We regret that Mr. Roosevelt does not make it plain in every such case as this, by some public statement, what the cause of removal is, but leaves the facts to leak out—or perhaps never come out. We regret, also, that he does not make membership in partisan committees, or active management of party matters, whether as a member of such a committee or as a "leader" who may not be a committeeman, also a bar to retention in the civil service. The collector of the port who runs his ward in favor of the Republican machine without making any public utterance, is quite as great an offender against sound rules of conduct as one who makes a speech against the machine.

The minority of the Coinage Committee of the House have made a report in opposition to Mr. Hill's bill to make gold dollars and silver dollars interchangeable at the Treasury. This is a measure which frankly acknowledges that silver dollars are "fiat money," and therefore ought to be redeemed on demand, like greenbacks and the Treasury notes of 1890. We have taken a long

time to face that fact, but we have come to it at last, and the question is whether Congress has the logical faculty sufficiently developed to do directly and openly what it does indirectly and covertly. It redeems the silver dollar by taking it as the equivalent of gold at the custom-house and for all other Government dues, and it exercises the option of redeeming it in gold at the Sub-Treasury when presented by private individuals. But it does not allow any holder of silver dollars to demand redemption at the Sub-Treasury as a matter of right. The minority of the Coinage Committee say that it would require a large increase of the gold reserve if the Government should undertake to redeem silver dollars in the way proposed by Mr. Hill's bill. That this is an entirely erroneous assumption must be evident from the fact that the silver dollars are now redeemed, as we have said, at the place where the Government's receipts are taken in. No more gold is needed to redeem them at the front door than at the back door, or vice versa.

The introduction of Mr. Babcock's bill to transfer certain portions of the iron and steel schedule to the free list must confirm the opinion that the tariff question contains the seeds of an "irrepressible conflict." The measure proposes to relieve of duty the heavy products of the furnace, such as iron and steel slabs, beams, girders, and structural iron, and thus necessitates the rearrangement of nearly all the paragraphs of Article C of the Dingley act. Mr. Babcock disclaims, of course, any thought of free trade. His avowed design is simply to safeguard the consumer by removing duties from such articles as are produced more cheaply here than abroad, and consequently do not need protection. The real significance of his bill, however, does not lie in its mere details. Mr. Babcock may say and think what he pleases about his object in suggesting tariff changes, but the fact remains that his action has been taken in spite of the warnings of his political associates and in the face of the protests of protected interests. He may be justified in feeling that his bill will "maintain the theory of protection in accordance with the best Republican traditions," but those who are profiting by the present duties do not care for "best traditions." Traditions are to them, in Pindaric phrase, "only a dream of a shadow." What they want is an opportunity to despoil the consumer. Western Republicans, for whom Mr. Babcock speaks, are coming gradually to feel this truth, and their utter revolt from present conditions is merely a question of time.

The New York *Press* has information from Hartford that the tobacco-growers of New England have broken away from their President, Mr. H. S. Frye, who was willing to concede something to the Cubans in the way of duties on tobacco. The annual convention of the tobacco-growers was held on January 14. Mr. Frye was present and made an address, in which he favored a reduction of the duty on Cuban tobacco wrappers from $1.85 to 35 cents per pound. The convention voted unanimously against this proposal, deposed Mr. Frye as their representative in Washington, and appointed a committee of three to take his place and to work against all concessions to Cuba. This action is in harmony with all that we know about tariff-protected groups, cliques, and coteries. No matter how large or how small they may be, no matter whether the tariff be 10 per cent., or 50 per cent., or 500 per cent., they savagely reject any proposal for a reduction, even when made by their best friends—such friends as President Roosevelt, Secretary Root, Senator Platt (of Connecticut), or Gen. Wood. Senator Platt has been quoted in interviews repeatedly as earnestly favoring a reduction of the tariff on Cuban tobacco, as a matter of duty and humanity, and we shall be much surprised if he allows himself to be swerved from this course by the resolutions of the Hartford convention.

In view of the very interesting present position of the commodity markets and international trade, the statement of our own foreign trade for the full year 1901, just published by the Bureau of Statistics, is worthy of careful study. That the exports would show a decrease from the preceding year was known beforehand; in fact, the amount reported, $12,400,000, is much less than was looked for, six months ago. It was apparent then that exports of manufactures must decline very heavily under the changed conditions of Europe's markets, and, as a matter of fact, the shrinkage from 1900 in this class of trade alone has reached nearly $50,000,000. What has offset most of this large decline is the growth of our agricultural exports. Contrary to all expectations in the earlier portion of the year, the shipment of these commodities has run $30,000,000 beyond 1900, and has, in fact, surpassed all other years, not excepting the "European famine year," 1898. Considering that we have hardly been exporting corn at all since August, this is a very notable showing. Furthermore, even in the matter of manufactured goods, it should be remembered that in our trade, as in England's, a fall in prices makes the decrease in exports look more formidable than the figures of quantities would warrant. It may be added that fully one-half of the decrease in manufactured exports has been in copper ingots, where a trade combination tried this year to stand in the way of natural laws. That the merchandise import trade of 1901 should show a heavy increase was to have been expected. As a matter of fact, it has increased continuously since 1896, with the single exception of the year of the Spanish war. Last year's full showing perhaps attracts the more attention from the fact that the total imports run for the first time beyond the huge figures of 1892. For 1901, the import trade was $50,000,000 beyond this previous high record. It would appear, moreover, from such classified figures as have been published for 1901 that the increase is not, as a rule, in competitive articles of commerce.

"If you should hear of a few Filipinos more or less being *put out of the way*, don't grow too *sentimental* over it." Such is the language which Gen. Chaffee, according to Mr. Joseph Ohl, addressed to that correspondent of the Atlanta *Constitution* after the massacre in Samar. Mr. Ohl writes that it might be "unfair to Gen. Chaffee for me to put in quotation marks all he said to me that day," but he does put in quotation marks the words we have quoted. The incident may properly be referred to Senator Hoar's special committee of inquiry. Representative John Wesley Gaines of Tennessee, who visited the Philippine Islands last summer, made his first statement as to his observations in a recent address before the students of Vanderbilt University. He learned in Manila that 75,000 translations of the Declaration of Independence and of the Constitution had been circulated among the Filipinos by Gen. MacArthur. "What do you think of circulating that d——— incendiary document, sir?" he was asked by an army officer. Mr. Gaines was not afraid to say that he had heard of many atrocities committed by American troops, and among other things had learned of the beheading of three American deserters as soon as they were captured by their former comrades, without hearing or trial. The Maccabebes in the employ of the American army Mr. Gaines denounced as the scum of the islands, traitors to their cause, thieves by nature and by tradition, who are hated by the Filipinos as irreclaimable cowards and robbers.

Like other observers, Mr. Gaines estimated that not less than from thirty to sixty thousand troops must be kept permanently in the islands. He was not, however, as much impressed with the imminent danger of a fresh outbreak as are so many officers now in the interior of Luzon. On this point the correspondent of the Atlanta *Constitution* has very decided views. He thinks that there is serious danger in arming Filipinos and teaching them the use of rifles. Disclaiming all purpose of posing as an alarmist, Mr. Ohl says of the army officers he has met:

"The most optimistic of them endorse the general view that, while the Filipinos

have bowed their heads to the storm, it is with them simply a question whether the time and the opportunity will ever come for another effort to take up arms in another fight for their freedom and independence, which is their greatest desire. Taken as a race, they may not have very definite ideas of freedom and independence; but, as a race, they resent the assumed superiority of the white man."

Retiring Governors, as well as incoming Executives, are expected to address the Legislature of Iowa when one goes out and a new man comes in. Gov. Shaw draws an attractive picture of the condition of the commonwealth which he has supervised during the past four years—the people prosperous, crime decreasing, although population is increasing, fewer persons sent to the penitentiary last year than in any other save one for a quarter of a century, exceptionally cordial relations between capital and labor, few deeds of violence, and no case of lynch law for more than a decade. But there is one bad blot upon the record. Sixty thousand persons are employed in factories, and the "sanitary condition of many factories is well-nigh alarming," while investigations by the Bureau of Labor Statistics show that a large number of children, some as young as ten years of age, are employed, "and the faces of many of them tell a sad story of overwork and over-hours." Shocking stories as to such abuse of young children have come from manufacturing establishments in some Southern States, but it is a disagreeable surprise to find the scandalous system thriving in so progressive a commonwealth as Iowa. It speaks well for the incoming Secretary of the Treasury that he would not allow a natural desire to felicitate himself and the State upon the general condition of affairs to prevent his exposure of this reproach and his demand for reform.

Washington is likely to present the spectacle, not very common in any country, of a city made over in accordance with a comprehensive scheme. The beautiful plan of L'Enfant has been in part sacrificed through the carelessness of his successors, so that the new work must be to some extent one of restoration. What is especially interesting is the project for a great outlying park on the Potomac flats, with full facilities for boating and bathing; and that for fountains in abundance, to temper the heat of the summer months. These plans are so accurately drawn that the entire project is presented to the eye in two models publicly exhibited, one representing the city as it is, the other the city as the Burnham Commission thinks it should be. It is distinctive of this movement for beautifying the capital city that it does not proceed haphazard—a park here, a drive there—but that, once for all, a competent commission of architects, landscape artists, and engineers have planned splendidly, as L'Enfant did before them, for a long future. Of course, these things are easier in Washington, where national pride is available for civic purposes, than they are elsewhere. But the notable success of Boston with the new park system might well encourage the Mayor of New York, when the time is ripe for such a movement, to urge a comprehensive plan for the permanent beautifying of this city.

The speech from the throne on Thursday naturally gave little idea of the serious problems which confront the British Parliament in the present session, and the debates in the two houses were hardly more illuminating. It was made clear at least that the Government is fully committed to the policy of thorough in South Africa, and that there is no disposition to negotiate with the Boers. Lord Rosebery found this attitude of the Government reprehensible, and the speech from the throne "jejune." But his own advocacy of "a passive policy of peace" is hardly calculated to arouse enthusiasm, for it is difficult to see how any "wise passiveness" on Mr. Chamberlain's part is likely to win over De Wet and Botha. The really serious thought of all who looked beneath the brilliant spectacle of the opening must have been upon the grave questions of internal policy with which the present Parliament must deal. The members of Salisbury's big, brute majority are a year further from the "khaki campaign"—a year more worried with the endless burden of the war. Meanwhile the time has come to settle with domestic matters which have fallen into arrear.

For the present session the most exalted Imperialists must become Little Englanders, and deal with such homely things as the Budget, education, and Irish land tenure. Any one of these will give Mr. Balfour trouble enough in the Commons, and he may not find the closure so handy a weapon as it was last year. Sir Robert Giffen, in the London *Times*, estimates the deficiency in the April Budget, now preparing, at something more than ten millions of pounds, and sees no prospect of the immediate reduction of the so-called "extraordinary" war expenditures. The country will respond, must respond, as manfully to Sir Michael Hicks-Beach's second challenge to pay the piper as it did to his first; but it will be likely to ask this time, "How long?"—a question which the Government cannot for ever wave aside as an impertinence. The educational question is hardly less pressing. The Government last August practically accepted defeat on its comprehensive plan, and passed a temporary measure, which restricted the powers of the school boards strictly to elementary education. This was represented by the Liberals as primarily an attack on the boards and on the night schools and continuation schools for children beyond the statutory age, which had grown up under their charge. Such it has proved to be, in effect, if not in intention. Dr. MacNamara has shown in the London *Daily News* that the enrolments in the board schools for the year 1901-2 will probably show a falling off of 100,000 pupils. Under the discredit of last summer's fiasco, the Government this session must formulate a comprehensive scheme for secondary education—a most delicate task, for which it has shown neither aptitude nor good-will. The Liberal opposition will be unsparing at this point. Finally, the Irish Land-Purchase Bill will be a most contentious measure. No Parliament yet has come off handsomely in the matter of Irish legislation, and the present khaki majority will hardly prove an exception to the rule.

Lord Cranborne's statement in the House of Commons on Monday is absolutely conclusive on the subject of the friendly service which England rendered the United States on the eve of the Spanish war. What has been widely believed and privately asserted is now for the first time officially verified. There were, according to the deliberate statement of the British Under-Secretary for Foreign Affairs, proposals submitted to England to join other Powers in "putting pressure on the Government of the United States," but with them "his Majesty's Government declined to associate itself." No documents were laid on the table by Lord Cranborne, but none were needed. Time enough to produce them when some foreign chancellery denies their existence. It is safe to say that none will, irritating as it must be to some of them to see England making herself known as the Power which prevented a European coalition against the United States. This great service was what President McKinley referred to when he said in Washington to the correspondent of the London *Times*, that this country would "never forget" what Great Britain had done in the crisis of the Spanish war. There may be a certain calculated timeliness in the revelation of the truth by the English Foreign Office. Lord Cranborne may have been squinting at a certain effusiveness of friendship for America visible just now across the Channel, having for occasion the launching of a schooner yacht in these waters for the Emperor, under the eye of his brother, Prince Henry, with the assistance, by request, of the President's daughter. Never mind that; the fact is officially established that it was England who was our best friend in a national emergency, and it should, for many long years to come, quiet, for very shame, the raging of our Anglophobes.

A WORKING PLAN FOR THE PHILIPPINES.

Once more the "settled" Philippine question is to be torn open by a debate in the Senate. It is expected to run on for a month or more; but at its very beginning there comes gratifying evidence that the Democratic Senators are recovering their grasp and developing something like the instinct of political leadership. The minority report of the Philippines Committee, marking out the line of Democratic opposition and contention, is drawn with great shrewdness and with real statesmanlike ability. It is eminently practical, offering a programme which could at once be put into execution, and it goes with directness to the heart of existing difficulties. It is constructive legislation, in the best sense of the word, since it proposes to bring healing measures and a far-sighted plan to bear where three years of dogged fighting have led only to misery, instability, and, as Gen. Chaffee confesses, a whole people sullenly and inveterately hostile. The problem is one for solution by statesmen, not by soldiers, and the Democratic Senators bring forward the necessary measure.

With true political skill they have seized on the pending bill for a Philippine tariff in order to make it the vehicle for a sound policy covering the whole vexed question. If the Philippines are not to be permanently a part of American territory, why go to work at this time to levy a special tariff on Philippine goods? The final status of the islands is really the previous question. To that the minority report addresses itself, and it does so in a series of propositions so weighty and strategic that we reprint them entire:

"(1.) That the United States relinquish all claim to sovereignty over the Philippines, 'subject to the provisions hereinafter set forth.'

"(2.) That from and after the passage of this act the Philippine Islands shall be foreign territory, and all goods entering the United States therefrom shall be subject to the same duties, customs, and imposts as are now or may be hereafter prescribed by law for goods entered from other foreign countries; provided, that during the temporary occupation of the islands all trade between them and the United States shall be free.

"(3.) That the United States shall continue to occupy the archipelago until the Filipinos have formed for themselves a stable government, and until sufficient guarantees have been obtained for the performance of our treaty obligations with Spain, and for the safety of those inhabitants who have adhered to the United States.

"(4.) That as soon as these results have been accomplished, it is declared to be the purpose of the United States to withdraw from the Philippines, and leave the government, control, and sovereignty thereof to the inhabitants, retaining only such military, naval, and coaling stations as may be designated by the Government of the United States."

It will be admitted by any open mind that the ordinary objections urged against withdrawal from the Philippines do not lie against this plan. There is nothing doctrinaire about it. We are to leave the islands because it is for the best interest of all concerned that we should. It is simply the every-day statesmanship of true self-interest that is recommended. Nor is there to be anything hurried or undignified in the process. All our international obligations are to be duly discharged. Our commercial interests are to be properly safeguarded. Without fluster or hysteria, the nation is calmly to announce to the Filipinos and the world the ultimate policy respecting the islands which justice and expediency alike impel it to embrace. This is both good sense and good tactics. The Republican Senators will find this Democratic line of battle exceedingly formidable. It will serve not only for the immediate debate, but for a concentration of sentiment and of forces throughout the country. Both for its own excellence and for the evidence it gives that the breath of life is once more in the Democratic Opposition, we can but welcome it.

By a striking coincidence, this minority report was published on almost the same day that the views of a well-known European publicist on the same subject reached this country. In the *Revue des Deux Mondes* for January 1, Pierre Leroy-Beaulieu has an article on "The United States as a Colonial Power." It is not an ill-natured or unsympathetic review of the way in which we got into our present predicament. M. Beaulieu sees a certain moral inconsistency between the professions with which we went to war, and the spoils with which we emerged; he even says that the Platt Amendment, forced upon the Cubans, was a "masterpiece of perfidy"; yet he assumes no Pharisaic air in consequence, for, "alas!" he writes, "the United States is not the only nation which has thus stultified itself, and the countries which are entitled to cast a stone at it are rare indeed." This writer, in fact, goes a good way with our Imperialists. He speaks of our expansion and the war with Spain as "inevitable," and justifies much that we have done in the past three years. To his mind, most of it goes hand in hand with our commercial enlargement.

Yet this keen and friendly critic puts his finger on the most glaring mistake which we made—the annexation of the Philippines. This, in the opinion of M. Beaulieu, is the stone of stumbling of American expansion. For in the Philippines we have, what we have in no other of our acquisitions, a race unassimilable and indomitable, a vast drain on our national resources with no return, and a constant threat of embroilment, with a manifest weakness in case of war. And the inference which this intelligent foreign observer draws is almost precisely the same as the plan put forward in the minority report of the Senate committee. Two or three ports in the Philippines, he maintains, would meet the full commercial needs of this country in the China seas. From the rest, withdrawal is the true policy; and M. Beaulieu is certain that, if President Roosevelt is not led to adopt it, it will be forced, sooner or later, upon his successors, "for the greatest good of the United States."

FOR A PHILIPPINE INQUIRY.

Senator Hoar's resolution calling for a select committee to inquire into the war in the Philippines is strictly in line with precedent. Whenever there has been some great scandal, or some important question wrapped in fog and mystery, the practice of Congress has been to name a special committee to investigate and report. Dozens of cases could be cited. Senator Lodge, it is true, plaintively protested that it would be a grave "reflection" upon the regular Philippine Committee, of which he is chairman, to go outside of it for investigators, and the resolution was accordingly referred to that committee. But everybody knows that a standing committee seems often particularly designed to smother, instead of expedite, investigation. Its pigeon-holes are enormous. Its waste-basket is gigantic. Long accustomed, and rightly accustomed, to prevent futile questions from passing out of its hands to vex Congress, its fixed habit is that of suppression and concealment. What we want in the Philippine business is free inquiry and full publication; and Senator Hoar is correct in maintaining that it is only through a special committee that we shall get them.

Such an open and fearless probing into the facts is needed, for one thing, to quicken the conscience of the country. We have grown callous to a state of things which, four years ago, would have filled the land with indignation. Suppose a public man had ventured, early in 1898, to propose subjugating the Filipinos with an army of 50,000 men, what would have been his fate? Universal public execration. But what would have seemed in advance a horrible thing, ought not to appear a natural and proper course simply because we are now pursuing it. The only reason it does so appear to many worthy people is that their sensations have grown dull on this subject. Their consciousness does not respond any longer to the words which once would have stirred its depths. The thing has become an "old story." People say they are "tired" of hearing about the Philippines. So we say a fresh inquiry is highly desirable to rouse Americans from the lethargy of jaded senses into which they are tempted to fall, as respects this matter of vital concern to the nation. We need to have the old facts set forth with new vividness; the truth dragged out from behind the conflicting official reports where it is hidden; and the national mind once more challenged

by the sharp questions, "What are we doing in the Philippines? How long are we going to stay there? What is the best way to withdraw, and save our honor and our principles?"

The inquiry should surely cover, and cover fully, the points which Senator Hoar mentioned in his speech of honest indignation on January 14. He says that he has seen with his own eyes a document, signed by Gen. Anderson, who was in command of our troops in the Philippines before Gen. Merritt arrived, in which that officer explicitly states that he promised the Filipinos their independence. This has been hinted at before, but never so explicitly asserted. Mr. Hoar affirms that Gen. Anderson admits "twice over his signature" that such a promise was made. Now this is a new and most material fact. The country is entitled to know all about it. Let no one try to slip out of it by saying that Gen. Anderson's pledge of independence was unauthorized, and therefore not binding. This is not a dispute about technicalities. The question is one of national attitude and national good faith. Besides, it has been bellowed from a thousand stumps that no such promise was ever made by any officer of the United States. Senator Hoar now declares that he has seen written proof (presumably in the War Department) that it was made. Of course, our Government was not bound by the unauthorized act of Gen. Anderson, but it was bound not to bury the truth in its archives. If a special committee is necessary to bring it out, by all means let us have it.

This relates to past events nearly touching our national honor, but there are things going on to-day in the Philippines which, as Senator Hoar says, are "a foul blot on the flag which we all love." He speaks of conversations which he has had with "brave soldiers and officers of high rank," who have told him of atrocities committed in the Philippines in the name of the United States. On those things, too, the light should be turned. These military witnesses should be allowed to declare from the housetops what they now dare only to whisper in the ears of Senators. They should be called before a committee in open session, and, under guarantee of complete immunity for any testimony they may give, should be asked to tell the whole country the whole truth. At present they are under the kind of terrorism which necessarily rests upon men in the military service. With this goes the inevitable official optimism which insists upon everything in the Philippines being for the best possible under the best of possible governments. Secretary Root, for example, denies that there is any friction between the civil and military governments; yet every one who has a correspondent in the archipelago, every one who talks frankly with returned agents or officers, every one who perceives the conflict between Gen. Chaffee's reports and Gov. Taft's, knows that there is friction, sometimes amounting to bitter animosity. Into this also there should be investigation, searching and unconcealed.

We must not pooh-pooh all this aside as something which does not concern us. Our national character is implicated. We cannot let ourselves be branded as a set of hypocrites. Our press and public have been crying out against the barbarities of the war in South Africa; how do we like to have Englishmen defend their cruelties by citing our own? There is an article in the last *Fortnightly* with this suggestive and, to us, humiliating title: "The Struggle in the Philippines: A Parallel to the South African War." If there is such a parallel, we ought to know it. The details should be set forth in the light of day. Such military successes and surrenders in the Philippines as are daily reported do not go to the core of the matter. Of course, we can beat down the scattered bands of insurgents when we catch them, but are there barbarities in our mode of warfare; is the cruellest torture used even by our police; is the whole Filipino people, as Gen. Chaffee asserts, filled with a settled hostility against its American rulers, and sleeplessly plotting to undo their work? These are the vital questions, and a speedy, clear, and conclusive answer to them should be given. In bringing up the whole subject Senator Hoar has done his duty as a patriot. Who of us can afford to be less strenuous than he in demanding that the truth, and the whole truth, be made known?

CONSOLIDATING THE ARMY SUPPLY DEPARTMENTS.

The announcement that Secretary Root is about to recommend to Congress the consolidation of the army supply departments, foreshadows a most radical and desirable military reform. It is the result of the Secretary's conviction, as stated in his annual report, that "the division of the supply departments into separate bodies, acting independently of each other, and each responsible only to a civilian Secretary of War, is a bad arrangement, resulting often in confusion, in conflict, in unnecessary expenditure of money, in increase of paper work, and making it difficult to fix responsibility."

With characteristic open-mindedness and thoroughness, Secretary Root thus put his finger upon one of the greatest evils in the army organization, the weakness which was probably responsible for more suffering, extravagance, and inefficiency during the war with Spain than any other. No other Secretary of War has ever come out so boldly against the staff departments, which, being firmly intrenched in Washington, have always wielded more political influence than all the rest of the army. Before Secretary Root's time, every effort to modernize this part of the service failed ignominiously, so that to the staff officers' distorted vision the line seemed finally to exist for the staff, instead of the staff's existing to fill the wants of the line. Within a very short time after taking office, Mr. Root realized the disproportion in the relations of the two parts of the army, and the evils which resulted. His first reform, the abolition of permanent appointments to the staff departments, was put on the statute-book February 2, 1901, when the Army Reorganization Bill was passed, and, from this time on, only temporary appointments are to be made. Each officer now transferred will serve four years in some department, and then be sent back to serve a stated term with his regiment before again being detailed to staff duty. Under the old system the officers appointed to the staff were chosen because of their political influence, and, once transferred, they lost all touch with the men in the field and their needs. Thus the Ordnance Corps, which sent the cavalry into the Santiago campaign with inferior pistols, has not yet, after four years, decided upon a modern weapon. As its officers never have to use the pistols, they do not see any reason for hurrying their deliberations. That the state of affairs thus illustrated will pass away as soon as the transfer system, now only begun, becomes the rule in all departments, is the belief not only of Mr. Root, but of all the progressive officers in the service.

The Secretary has not, however, been content with this memorable reform. He has seen, as have the younger officers for ten or fifteen years past, that the organization of the supply departments is wholly antiquated, and fully seventy-five years behind the times. In their functions, the Quartermaster's and Commissary Departments may be properly compared with a modern business enterprise. But what commercial organization could have avoided bankruptcy had it divided the different parts of its business among sets of clerks, each with a separate head, each set and each head extremely jealous of the other, and each refusing to communicate with the other except through lengthy and formal documents? Yet this is a fair statement of the relations of the staff departments with each other, which led to such shocking and frequently disgraceful results in 1898. To make matters worse, the division of duties has been absurd to a degree. To give the most striking instance, the Quartermaster's Department has had to supply the tables and chairs of the men's mess-rooms, the Ordnance Department the knives, forks, and spoons, the Subsistence Department the food, while the cooks have received their wages from the Pay Department. But while the Sub-

sistence officers have been permitted to buy food for the men, they have never been intrusted with the duty of purchasing food for the animals. It constantly happens that a quartermaster at a post may be disbursing thousands of dollars monthly for new buildings or roads, repairs, forage, or what not, and yet he is never allowed to pay the troops. For this purpose an officer of an entirely different department must travel perhaps a thousand miles. In the navy of the United States one officer, the paymaster of a ship, has long performed all the functions which are now divided among three or four army departments.

It is plain that simplicity, efficiency, economy, and common sense have long demanded the change which Secretary Root urges. As disclosed thus far, his plan is to have one large supply department, in place of the Quartermaster's, the Subsistence, and the Pay Corps. This is to have a head with the rank of major-general, and will comprise four divisions, dealing with subsistence, finance, transportation, and construction, each in charge of a brigadier-general. Whether this is the most practical and desirable division of the duties of the new department, time alone will show, but that it is along the right lines is undeniable. There will in some quarters be criticism of the number of generals proposed. On the other hand, it will be said that more than one high position must be held out as inducements to men to qualify for this line of service. Secretary Root believes that many officers must be attracted to this kind of work, in order that there may be many qualified to undertake the staff duties with volunteer armies in the event of war. He would make impossible hereafter that resort to "sons of fathers" and politicians which marked the McKinley régime in 1898, with the excuse that there were no others better qualified.

In any event Secretary Root's plan assures prompt coöperation between the divisions which should work with full knowledge of each other's plans and purposes. Under it there should be an end to the tiresome delays in securing supplies, and the mistakes so frequently made in 1898 of shipping food to one point and other supplies to an entirely different place. Congress should not fail to act upon Secretary Root's measure at an early date, if for no other reason than that it will inevitably save large sums for the Government. Like Secretary Root's other reforms, this one, if introduced, will make his administration of the War Department memorable in army history.

THE CASE OF MR. SCHWAB.

The case of Mr. Schwab of the United States Steel Company is in many respects a peculiar one. It seems certain that, during his vacation in Southern France, he visited Monte Carlo, played the tables recklessly, was for a moment the hero of the gamblers and pleasure-seekers of that notorious resort—in short, conducted himself like a weak man in the first wantonness of newly acquired power to spend. Despite a qualified and unsatisfactory denial of "sensational" gambling, one must believe that the great ironmaster behaved rather worse than the average wealthy man of little principle would have done.

It is precisely because Mr. Schwab is not the average wealthy man that his alleged actions have called forth bitter and well-deserved rebukes from many quarters. Mr. Schwab's wealth has not been lightly won and precariously amassed as the result of speculative operations, but it constitutes the just reward of rare special ability in a difficult manufacturing enterprise. His experience has been of the kind that usually sobers a man and hardens his moral fibre, and it is painful to feel that one who represents a well-earned success, who controls the lot of hundreds of thousands of laborers, and who conserves the interests of an army of investors, should be capable of playing the part of a gilded youth in the first riotous enjoyment of his patrimony, or that of a stock-jobber of the Jim Fisk or the Barney Barnato type. This is not the sort of man to be in a position of great trust and of vast financial responsibility.

To account for the case of Mr. Schwab is not difficult. It falls under the head of the demoralizing effect of money earned more rapidly than its wise spending has been learned. Here the social satirist might be tempted to write a bitter chapter on the subject of Deferred Wild Oats, and a very sordid chapter it would be—of dissipation after dissipation has lost the glamour of hot blood and high spirits, and of debauchery which borrows no grace of Epicurean theory. Where many a man who has become suddenly rich has fallen into this slough, one would willingly believe that Mr. Schwab has merely exhibited the recklessness which makes such a fall possible. In either case his example is deplorable.

Our millionaires, and particularly the self-made men among them, embody the ideal of the average American young man. Mr. Schwab's splendid ability is to a host of American boys and young men a shining object of emulation. In like manner his ability to fling down on the roulette table single stakes which exceed the year's wages of the average ambitious youth, is a challenge to the imagination of many a struggling young man, and a direct encouragement of many a boy whose first small savings are already drifting into the policy-shop or the pool-room. Such an example is doubly unpleasing from a man who had begun to wield large influence as a leader of public opinion—advising parents against the time-wasting and spendthrift influences of college education, and speaking sober economic truth to the leaders of organized labor. Surely he presents an unedifying example of the education which he advocates in preference to that of the college, and belies that sturdy training as a laborer of which he is justly proud. In short, the wealth which is earned imposes a kind of special obligation, like that of gentle birth. The self-made man has escaped the enervating influences of a too easy course, and has acquired an intimate knowledge of men and of affairs which should create in him a finer and truer sense of social obligation than is often felt by the man who is born wealthy, and therefore should make his use of wealth doubly scrupulous.

Far more surprising than Mr. Schwab's failure to grasp this point of personal honor, but hardly less regrettable, is the fact that he vainly imagined that the head of a great corporation could permit himself the irregularities which are condoned in obscurer men. Many who palliate the actual offence will think this an error in judgment which disqualifies him from holding his high position. For better or for worse, the great leaders of finance are the princes of to-day—our *noblesse*. Their every movement is reported, their pleasure trips are royal progresses. This, we believe, is unfortunate, alike for the millionaires and for the public—it inculcates a false sense of values; but this is the case before us. And for the "iron king" or the "copper king" there is no convenient incognito, such as the royalty of blood may affect—no transparent disguise which all may penetrate but will respect. Towards the head of a billion-dollar company the eyes of a multitude are directed. The character and the judgment of its President are the chief guarantee that the smallest investor is secured in his interests. We no longer tolerate in our public officials moral delinquencies which become openly scandalous, and such offences in the presidents of banks and great stock companies seriously impair the credit of their respective institutions. Against this wholly just sentiment Mr. Schwab has offended grievously. Many who waive the broader moral issue will feel that in the gross forgetfulness of his great responsibility, and in the readiness to accept for the President of the United States Steel Company those facile moral standards which might serve for the mere man of wealth, lies the sum of his offending. We regret profoundly that so typical an example of great wealth and high position fairly earned should symbolize also the profligate misuse of wealth—that a character which we have observed in many admirable aspects should so signally fail in the point of honor which great responsibility imposes.

THE NAPLES TAMMANY OVERTHROW.

ROME, December, 1901.

When the royal decree of November 8, 1900, instituting a commission of inquiry into all the acts of the municipal administrations of the city of Naples appeared, we felt a certain incredulity as to the result, remembering the innumerable *inchieste* that have been ordained and completed during the forty years that have elapsed since Garibaldi entered, inaugurating the Unity of Italy under the house of Savoy, and the Bourbons fled, leaving him victor all along the line. Something has resulted from the numerous public and private "inquiries" made in the island of Sicily; but in Naples, from the hour when Garibaldi quitted the city for Caprera, and the Moderates, taking possession, inaugurated their partisan reign, to their downfall in 1876 and the instalment of their successors, the Left, alias Progressists, Liberals, Reformers—again, to the overthrow of these, and the dictatorship of Depretis-Crispi, of Crispi alone—again, through the successive reigns of Rudini-Nicotera, of the "law by decree" ministry with the horrors of 1898—up to last September things had gone from bad to worse, and King Camorra, from a pretender to an uncrowned sovereign, had continued his triumphal career until, at the death of Humbert, he was the uncontested, uncontestable, inviolable monarch of Naples and the provinces.

Your readers are not unacquainted with the performances, character, and attributes of King Camorra. They have read Villari's descriptions, which have grown more and more vivid and emphatic, from his first Southern Letters to his pictures of the misery and ignorance of the plebs, the corruption, oppression, and general infamy of the ruling and wealthy classes, culminating in the photographs of the "disembowelment" of Naples, the robbery of the 100 millions destined for the housing of the poor—seized by the municipal authorities and their clients for themselves with connivance of the provincial authorities and sanction of the successive governments at Rome; or, if not direct sanction, non-interference, in order to retain the votes of the electors who seconded their choice of candidates. Nor has your present correspondent failed to expose the situation, which could not be exaggerated, either in itself or in its fatal consequences to the entire life of Italy, even as cancer taints the whole system, poisoning its very heart's blood. Cavour, who cannot be justified for the means which he employed to oust the entire party of action which had freed Naples from the Bourbon—in order to install the stanch supporters of his policy, the champions of the House of Savoy—was fully aware of the crucial problem involved in the annexation of the southern provinces, especially of the Neapolitan, as affecting the moral unity of the new kingdom. In the years that elapsed between 1793 and 1860—if we except a brief moment at the commencement of the reign of Ferdinand—the one aim of the Bourbons was to exterminate all the intelligent, patriotic citizens by death on the scaffold. Between the 31st of October and the 11th of November, 1793, one hundred and twenty physicians, professors of the university, millitary and naval officers, and fifteen priests, were hung in the market-place; thousands were imprisoned and banished, their property sequestrated, their families reduced to misery. The executions and murders that took place during the reign of terror, 1799-1800, can never be enumerated, as all the documents of the famous Giunta were burnt by order of the King, on his restoration. The same system was continued in 1821, in 1830, and again in 1849. At the same time, every effort was made to maintain the plebs in a state of ignorance, superstition, and corruption.

Garibaldi and his Secretary-General, Dr. Agostino Bertani, at once recognized the dangerous condition of the masses steeped in misery, vice, and corruption. They set to work to reorganize the police, which the Bourbons had used solely in order to persecute the patriots and to enlist in their service the camorrists and malefactors. Garibaldi abolished the secret-service fund, established twelve infant schools in the twelve quarters of the city; a military college for the sons of the poor; allotted to the communes the product of the *octroi;* commenced the abolition of lotteries, and introduced the system of saving banks; decreed the sequestration of ecclesiastical property. To the short term of Garibaldian administration also belongs the first attempt at sanitation and the disembowelment of Naples. Cavour, who had made a special study of Naples as early as 1847, and then wrote that "no province of the peninsula had suffered equally, during centuries of domination by foreigners, such excessive feudal oppression, undergone such bloody revolutions, or such sanguinary oppression," at once recognized the importance of thorough reorganization of the entire system of government, administrative, educative, moral, and material. In a memorable treatise on Italian railroads, he dwelt upon the necessity of extending the Neapolitan lines to the toe and heel of the Southern provinces, and did his utmost to encourage the influx of Italian and foreign capital, regarding the population, with all its ignorance and corruption, as frugal and naturally intelligent, well suited to form an active industrial community. He sent one of his ablest helpers, Vittorio Sacchi, to study the finances of the city and provinces. As secretary to the first Lieutenant-General, the Prince of Carignano, he sent Costantino Nigra, with instructions to found and encourage various industries. "If," he wrote, "we do not place the various provinces of Italy, and the southern ones especially, in a position to increase their production, we shall encounter a sad future. Taxes must be increased, but first we must increase the contributive capacity of the population by stimulating production and the formation of wealth." So complicated did the state of Naples appear to Cavour that he did not hesitate to admit the possible necessity of special administrative measures to be voted by Parliament, even as Mazzini also counselled special administration for the islands. Up to the last moment of his life the Neapolitan problem occupied Cavour's thoughts. "I am grieved by the situation of Naples," he wrote, "but neither surprised nor discouraged. People cannot be regenerated in a week, nor can political difficulties be overcome by gymnastics. The regeneration of Naples depends chiefly on the strength and the honesty of the Government. We must prepare to resist all pressure, all political influence, at the cost of exposing the Ministry to extreme unpopularity." But June, 1861, deprived Italy of the great statesman, and his successors managed in a very short space of time to efface every trace of Garibaldi's efforts and of Cavour's good intentions.

Your experience of Tammany Hall proceedings can give but a faint idea of the state of Naples at the death of King Humbert; and that his son and successor was fully aware of the depths of degradation to which his native city was reduced, is a fact well known among his intimates, although he never, during his father's life, interfered, directly or indirectly, with political or administrative affairs. His cordial welcome to Zanardelli (who, throughout his entire career, has not a blot on his moral character, and who, during his brief months of power under Kings Vittorio and Humbert, had struck the note of morality in a key quite too high for the ears of most of his colleagues) was not unconnected with his desire to see a moral régime introduced and supported in the South. The deepest depths of corruption had meanwhile been reached in every department of municipal and, as we shall soon see, provincial administration, while the wholesale plundering of the charitable institutions had reached a point which, if surpassed, would leave nothing more even for the plunderers. *La Propaganda*, a newspaper conducted chiefly by young Socialists, attacked on front, rear, and flank the communal administration personified in the Syndic Summonte, strongly supported by the now ex-Deputy Casale. Many such attacks had been made by honest newspapers, Moderate, Liberal, and Clerical, but the results had been zero, the Government either interfering or ignoring the questions, so that the authors of the attacks have generally undergone heavy sentences for libel, defamation, calumny. But Casale, unable to keep silence in the face of the direct accusations made against him, brought an action for libel against the director of the *Propaganda*. He believed that he should gain a verdict by placing the action on political grounds, by attacking the Socialists as such; but neither public opinion nor his judges fell into the trap. All understood that the honor of Naples was at stake; and as the pillagers and plunderers had gradually restricted the number of the sharers of the spoils, many who had been excluded came forward with their testimony. The witnesses summoned by Casale to attest his honesty and uprightness declined the office. Called upon to explain his private resources, to say how he managed to live like a prince on a pauper's income, he tried to withdraw the action; but the Public Minister, seeing that even the Syndic Summonte, when summoned, failed to appear, declared that no other witnesses for the defence need be summoned, and, instead of drawing up a case for the plaintiff Casale, denounced him severely, and expressed his surprise that a public officer (Comm. F. S. Gargiulo, substitute of the Procurator-General at the Court of Cassation in Naples) should have come forward to maintain the honesty of Casale.

The sentence of the tribunal was most severe. It was found that "the facts asseverated by the *Propaganda* were fully proved." The conclusion of the sentence is tremendous:

"To all these specified facts of such ex-

ceptional gravity that the plaintiff resorted to a prudent retreat, is joined the public voice, which continues terrible and incessant, and has reached high functionaries who, present at the trial, were unable to refute it. This element cannot be ignored, as it but sums the affirmations which have long resounded throughout the country concerning the extraordinary influence exercised by Casale under cover of his political principles. The immorality thence emanating is such as to nauseate every honest conscience, and to affirm this in a verdict is the commencement of regeneration."

In consequence Casale was compelled to resign his seat in Parliament and in the provincial council. The municipal council, directly aimed at by the verdict, had, after a vain struggle, to resign. Then a proposal made in December, 1899, by eleven members of Parliament, but rejected, was revived, and, despite the protests of the Neapolitan press, which with three exceptions was in the pay of the spoilsmen, carried the day; the then president of the Council of Ministers, Senator Saracco, proposing a royal commission of inquiry, with plenipotentiary powers, and appointing a Royal Commissioner to administer the commune of Naples.

The report of the Commission, which occupies two folio volumes of 900 pages each, touches but slightly on the years preceding 1876, so that the Moderate party does not really come in for its just share of blame for corruption, malversation, and alliance with the Camorra; but enough is proved to show that to it belongs the beginning of the hideous story. It dwells briefly on the administrations between 1876 and 1896, giving strict account of the four years that elapsed between 1896 and 1900. In 1896 arose the administration which, in the words of the Commissioners, "was, headed by Summonte and his followers, the commencement of the shameful corruption, the disastrous evils, which culminated in the catastrophe of 1900." Some of the councillors, after denouncing the general state of corruption in all grades of the administration, succeeded in getting a commission of inquiry. Appalling revelations were made, but the whole affair was quashed by Casale and Summonte. The same happened with the inquiry into the conduct and condition of the municipal guards. The jobbery in the new contract for the water-works of the Serino, for electric illumination for the tramways, takes away one's breath by its colossal scale, its flagrant impudence. The municipal technical council protested in vain; the corrupt domination of Deputy Casale overpowered all attempts of brave and honest citizens. The Secretary-General of the municipality, Cammarota, resigned his post, being unable "to fulfil his duties and to secure the public administration of the city." Despite the constant cooking of the budgets, enormous deficits continued to increase. The remuneration of the servants of the municipality was increased from three to nine thousand lire per month. New posts were created, and, of course, all the employed were converted into electoral agents and actors. The corruption in the educational departments passes description. Masters and mistresses, many without certificates, were appointed, after paying a fixed tax. Parents of children were induced to vote on the promise of special advantages to their children. One assessor of public instruction writes: "The greater number of schoolmasters belong to the Association of Teachers; they are the worst of their class, and are controlled by Marzano, the sectional director, who is allowed a free hand by the administration, and uses it to ruin the schools. The directors and directresses coerce the masters and mistresses, who in their turn work upon the parents on the *do ut des* principle." This association secured 1,500 votes, and, united to that of Casale Aliberti, controlled 6,000 votes. Payments, gifts, etc., on the eve of the elections, surpassed half a million.

A small minority protested in vain; the Summonte administration had bought up, with three exceptions, the entire Neapolitan press. The director of the *Corriere di Napoli* had headed his leader on the nomination of Summonte for Syndic with the words "La Vergogna è Consumata," but, appointed inspector of the tramways, suddenly discovered the perfection of the new Summonte administration. The editors Rosolino and Rota were also employed by the municipality, and their reports duly corrected by the Syndic. But this was not all, as De Martino, who was the first to reveal in Parliament the iniquities of the Summonte administration, testifies. The responsibility of the trinity Summonte, Casale, Scarfoglio, cannot be separated. No favor could be obtained from the Syndic without the intervention of Scarfoglio, editor of the *Matin*, or his substitute, Vincenzio Candia. These creatures sold their patronage for hard cash—12,000 lire for the concession of the baths, 30,000 for the prevention of a company for electric illumination, 18,000 for a tramway company, while in the "scandalous loan contract" 500,000 was divided between Scarfoglio, Summonte, Casale, and one Delieto. Not only Scarfoglio, the cleverest journalist in Naples, but his wife, the great novelist, Matilda Serao, is exposed with chapter and text as a saleswoman of places and posts. The details are all too nauseous to continue.

The sensation created throughout the country may be imagined, but people were prepared to hear the worst. "Could any sound thing come out of Naples?" Zanardelli thought there could, and the King seems to have been of this opinion. So the Prime Minister refused to prolong the sojourn of the Royal Commissioner at the head of the administration, and the general elections were announced. The Government abstained from the faintest pressure. The electors were left for the first time severely alone. The Camorra united their forces, not putting forward as candidates either Casale or Summonte, but hoping to secure the election of the rank and file of their followers. Not one succeeded. All political questions were tabooed; the candidates supported were "honest men," or at least such as had not a stain on their reputation. Many of them had been among the first and the most constant in exposing the infamy of the last administration when at the zenith of its power. About an equal number of Catholics and Moderates have been elected, and, for the minority, all the Socialist candidates put forward. The *Pungolo Parlamentare* and the *Roma*, the two honest newspapers never tainted by, and always declared opponents and denouncers of, the Camorra, are jubilant. They from the first appealed to Zanardelli and to Giolitti to allow the elections to take place at once in order to prove to the world that not Naples was corrupt, but merely a certain number of malefactors whom circumstances and sins of omission and commission on the part of the central Government had rendered omnipotent. The inquiry had proved the culpability of these usurpers; only the electors of Naples could pass sentence on them by rejecting them with contumely and unanimously. The sentence has been passed and can never be revoked. It now remains for the judicial authorities to perform their part.

Naturally, the condemned are vociferous in proclaiming their innocence. Scarfoglio dedicates twenty-five columns to prove that only envy of his genius and success as a journalist led to the accusations, and promises defiantly to triumph over all his calumniators. Matilda Serao fills the papers of Berlin, Vienna, and, where she can secure admittance, of Paris with her lamentations, and insults the entire Italian race and nation, including the dead King and his young successor. Summonte has written a pamphlet to prove the virtue and beneficent results of his administration. But no one heeds any one of the protesters. All know that the accusations are true and "proven." The grand question now is how to repair the evil accomplished, and to prevent the upas tree cut down to its roots from putting forth fresh shoots from the undersoil. A very careful perusal of the two volumes impresses one with the immense difficulties of the situation. Local taxation is enormous and cannot be increased to supply the two millions annual deficit or the ten millions of accumulated deficit. But of the taxes voted about 30 per cent. are unpaid, and the non-payment has been connived at, nay condoned, by the municipality. Most of the remedial measures proposed by the Commissioners have been accepted by the Government. Zanardelli, in his grand speech of December 13, which was applauded by all parties and sections of the House, has pledged the Government and the nation to use every effort for the redemption of the southern provinces at any cost or sacrifice—not by violent, spasmodic measures, but by a gradual system of necessary public works, such as the aqueduct of the Puglie. Meanwhile, the inquiry into the administration of the charitable institutions and of the provincial administration is to be carried out without delay. At the same time the inquiry into the municipal administration of Palermo has just terminated and the municipal council dissolved.

Italy on the whole is looking up. Her finances have never been in such a flourishing condition as at the present moment; her commerce and industries are on the increase; gold is nearly at par. It was a fitting moment for this moral inquiry to be set on foot at the moment of her ascertained material progress. I find many "competent" persons, who, five years ago, despaired, now really hopeful, yet anxiously watching events, and awaiting the results of certain trials of notorious criminals belonging to the Mafia, who have hitherto escaped conviction. We confess ourselves to a certain amount of hopefulness, but it is accompanied by a much larger portion of fear and trembling. J. W. M.

THE PROSPERITY OF BRITISH INDIA.

DUBLIN, December 14, 1901.

I have before me one of the most startling works that have appeared of late years upon British rule in India.* It is by William Digby, a competent authority. He resided in India for many years, was decorated by Government for his services, and is the author of several works upon Indian subjects. Adopting the words of the late Secretary of State for India, he says: "The question I wish to consider is, whether that Government, with all its machinery, as now existing in India, has, or has not, promoted the general prosperity of the people of India, and whether India is better or worse off by being a province of the British crown; that is the test." He answers this question upon the whole in the negative. "Only as [my] statements are adequately supported by the evidence—all, be it never overlooked, obtained from Government sources; in economic matters my sole reliance is on the official evidence—do I ask for their acceptance."

We have here a storehouse of facts and figures illustrated by diagrams. The author's statements would perhaps carry more weight if less emotionally put forward—if there were less poetry and fewer lines of capitals and exclamation marks; if the facsimile writing with which the book opens were in ordinary print, and if there were less continual thrusting upon the reader of the moral drawn by the author from the facts stated. In estimating the weight to be attached to his general conclusions it may be well to bear in mind that *India*, the official organ in England of the Indian National Congress, refrains from actually endorsing Mr. Digby's inferences. In an appreciative review, it says: "Its value may be open to discussion. But at least it cannot be said that those who insist on the prosperity—the increasing prosperity—of India, have no case to answer."

Mr. Digby acknowledges benefits conferred upon India by intercourse with the West and by British rule. We are given a list of thirty objectionable or murderous customs, in full force one hundred and fifty years ago, now obsolete, but—

"certain evils have been developed as the result of our rule which kill more people in a week than Suttee was responsible for in fifty years. However, be that as it may, I am anxious to put in the forefront the beneficent results of British rule. The more they are recorded, the better for the argument of this book. For the incidents related show that the power to insure beneficence exists as well as the desire to do well by India; and while these are in existence, awaiting appropriate circumstances for manifestation, there is hope for India's recovery."

The picture drawn of the present condition of the country is dark enough. Within the ten years 1891-1900, 19,000,000 of our fellow-subjects in India have died of famine, nearly four times as many as the war-deaths of the civilized world, 1793-1900. Mr. Digby calculates the average annual income of the population in British India at 22s. 6d. (against 40s., the estimate of Lord Curzon); or, excluding 1,100,000 of the wealthy classes, only 12s per annum, as the income of 230,000,000 of the people. He believes that, in the absence of special seasons of famine, there are 70,000,000 hungry people in the country; but that famine has now become chronic. In 1890, among an Indian agricultural population of 140,000,000, from whom reliable returns could be obtained, there were but 90,000,000 animals—cows, bulls, buffaloes, horses, donkeys, sheep, and goats (against, it may be said, 9,700,000 among a population of 4,750,000 in Ireland at the same date). In India twenty-three years is the average of life; in Great Britain, forty. An average of twenty pounds each of salt is what such a population of vegetarians would naturally require; all they can afford is thirteen pounds, including what is used in manufactures. Salt has within a century quintupled in price. Mr. Digby is of opinion that, while education and enlightenment are spreading among the middle and upper classes, the masses of the people are growing poorer year by year. In the first quarter of the century just ended there were five famines and 1,000,000 deaths from famine; in the second quarter, two famines and 500,000 deaths; in the third, six famines and 5,000,000 deaths; in the fourth, eighteen famines and 26,000,000 deaths. A non-official estimate of Indian average income in 1850 put it at 2d. a day; an official estimate in 1882, 1½d.; Mr. Digby estimates it at present as ¾d. He calculates the taxation of India as 3s. 3d. per head (one-seventh of income), or, outside 1,100,000 of the richer classes, 2s. 6d. per head (one-fifth of income), while in the United Kingdom the taxation is about £2 13s. 8d. (one-fifteenth of income). Apart from these proportions, it is manifestly easier to pay the latter sum on an income of £40, than the former on an income of 12s. 6d. India has, upon the whole, grown poorer since its first occupation (*India* pertinently remarks that the absence of reliable records and statistics in the earlier periods makes comparison with the present difficult). Our author compares what Lord Clive said of Murshidabad, the old capital of Bengal, when he entered it in 1757, with what could be said of any Indian city now: "This city is as extensive, populous, and rich as the city of London, with this difference—that there are individuals in the first possessing infinitely greater property than in the last city."

Mr. Digby believes the main cause of India's deepening poverty to be the manner in which her wealth and resources have been and are drained off and spent in England. Whatever the misdoings and exactions of her previous conquerors, the money levied by them was spent in the country. He believes the wonderful start made by England at the end of the eighteenth century was largely upon the capital drawn from India—that between the battle of Plassy, 1757, and Waterloo, 1815, £1,000,000,000 was transferred from Indian hoards to English banks. That this drain continues he has no doubt. He more than once quotes one of Lord Salisbury's cynical admissions, that "India must be bled." The present annual drain to England, consequent upon India's conquest and dependent position, he calculates at some £22,000,000. (Mr. Naoroji, late M. P. for Finsbury, in his 'Poverty and Un-British Rule in India,' puts it at a higher figure.) Such estimates imply consideration of some of the most delicate and intricate problems in economics and finance, not easy for the ordinary reader to grasp or follow.

Taking the returns for 1898-99, there was paid in India for Government salaries, with proportionate retiring allowances. £10,488,000; £5,333,000 went to 8,000 Europeans, an average of £607 each; £4,666,000 went to 130,000 Indians, an average of £36 each; £487,000 went to 6,000 mixed race, an average of £81 each. Mr. Digby and others believe that most of the work of the country could be effectively done by Indians themselves, with large saving to the public. The lowering of the mental calibre and spirits of the people by present methods of rule he believes to be one cause of the depression and want of energy and initiative in the country generally. Respect for Indian character and the weight attached to Indian opinion diminish in proportion as we recede from the days when Indians, in command of completely equipped armies, faced us in battle, when they ruled as emperors, when they walled great cities and erected forts, temples, palaces, and mausoleums which will be the wonder of all time; when every necessary and luxury and ornament of life was produced by Indians in India itself. In proportion as transit between England and India has become easier, the English in India have come to consider India as less of a home, more as a place of exile; native society has been less necessary to them, native opinion of less account; while Indians are appointed in the minority on divisional councils.

"Not one Indian, during a whole century, has occupied a seat in the Supreme, or Presidency, or Provincial Executive Councils, nor in the Secretary of States Council in England. . . . Given fair play, Indian administrators would, in their own way, and so far as circumstances permitted, have become the equals of Cavour, of Gortchakoff, of Gladstone, of Disraeli. . . . Their natural abilities being what they are, where do they show in the nineteenth century?"

"'As a hindrance to their proper recognition as men of character and often of noble life," Mr. Digby considers, "the Christian missionary societies of England interested in India have done the Indian people almost irremediable mischief." Missionary societies, in their widespread and continuous propaganda at home, urge their claims for support largely upon depreciation, often shamefully untrue depreciation, of Indian character. They thereby also curry favor with the official classes in India, falling in with their desire to hold Government positions as far as possible in European hands.

We must all hope that Mr. Digby's description of the condition of affairs in India is unduly discouraging. It differs widely from that of Sir John Strachey, G.C.S.I., in 1894, towards the close of a long official career as Finance Minister of India. "Mr. J. S. Mill declared his belief that the British Government in India was 'not only one of the purest in intention, but one of the most beneficent in act, ever known amongst mankind.' I do not doubt that this is still truer now." Mr. Digby's statements, however, must be met by counter statements and argument, not by mere denial. Political experience teaches us that official opinion can nowhere be safely regarded as infallible—especially in relation to systems which the official administers. The United Kingdom, if it is to do its duty, must more than heretofore apply itself to

* "Prosperous" British India: A Revelation from Official Records.' By William Digby, C.I.E., author of 'The Famine Campaign in Southern India, 1877-'79' [and other works]. London: T. Fisher Unwin, 1901. Pp. xlviii, 661, map, 21 diagrams.

the consideration of Indian affairs. An empire cannot be based upon lasting foundations where citizens in one portion of it are refused admission or placed under restrictions in other portions, and where race and color are bars to equal advancement.

D. B.

THE GRANDE MADEMOISELLE.—II.

PARIS, January 4, 1902.

The Grande Mademoiselle was among the bitterest enemies of Mazarin. It was the fashion of the time to be in the opposition; all the "people of quality" were hostile to the foreigner who was the ruler of France, who filled his coffers with French money. Mazarin was a shrewd politician, and had many means of spreading division among his enemies; his strongest card was the Queen herself. Many historians have asserted that there was a secret marriage between the Queen Regent and her minister. There does not exist any positive proof of this, but the famous "carnets," Mazarin's letters to the Queen, all we know from the memoirs of the time, tend to show that the power of the handsome Italian Cardinal over the Queen was unbounded. All Paris was persuaded that the Queen was his mistress. Anne of Austria found in her bed anonymous letters expressing the anger of her subjects. Mademoiselle followed the fashion; she had a poor opinion of Mazarin, and openly declared herself against him.

She was now twenty years old. She describes herself at that time in the famous 'Gallery of Portraits' which she wrote—a volume exceedingly rare in its original form (M. Édouard de Barthélemy published a new edition of it in 1860). Such "portraits" were a fashion of the time. Mademoiselle is very indulgent to her own charms, on which she dilates complacently. In another volume, 'Portraits of the Court,' she is thus represented by an anonymous writer:

"This princess of the blood of kings and princes is proud, bold, and of a courage more masculine than feminine. She may with truth be called an Amazon, and more capable of using arms than the spindle. . . . She is proud, enterprising, free of speech, and cannot bear anything which seems contrary to her thought. She never liked the ministers of the King or of her father, because she was obliged to show them some deference. . . . She is of an impatient humor; her spirit is active and her heart ardent in whatever she undertakes. . . . She does not know what dissimulation means, and expresses her sentiments without caring for anything."

With such a character and such sentiments, it is not surprising that Mademoiselle found a natural field for her activity in the troubled period which in the history of France bears the name of the "Fronde," and which may be called the heroic period of her life.

Paris was in a state of fermentation during all the time of the Regency of Anne of Austria. The Parlement and the Court were at open war. Mademoiselle, no more than the other great ladies of the Fronde, was animated by any other sentiments than pride, personal ambition, family hatreds and ambitions. She is candid enough to tell us that when she heard of the great victory of the Prince de Condé at Lens over the Spaniards (August 20, 1648), she was very sorry; she considered the branch of the Condés as dangerous to her own. "Nobody," she says, "dared to give me the news. The report of the battle which had come from Paris [she was at the time in her château of Bois-le-Vicomte, near Meaux] was put on my table; when I left my bed, I saw this paper. I read it with much astonishment and pain. . . . At this juncture I found myself a good enemy rather than a good Frenchwoman."

On the day when the Parisians made barricades in 1648, Mademoiselle was curious to see the spectacle. She crossed the Pont-Neuf; the chains which the Parisians had placed across the streets fell before her. "Popularity," says Arvède Barine, "is never based on reason in Paris; the men in the street adored this authoritative Princess. . . . At the end of her excursion Mademoiselle became a prisoner of her popularity." After the day of the barricades, on the 13th of September, before daylight, Mazarin took the young Louis XIV. out of his bed and fled with him from Paris. The Queen followed them on the road to Rueil. Her flight left the Parlement sole master of Paris. The consternation was general. All the people who depended on the Court left the capital. Mademoiselle, though she was a Frondeuse, viewed the disorder of Paris with much concern. She was also a Princess, and did not like to see the authority of the King diminished. One day she approved the acts of the Parlement, the next day she looked upon them as a usurpation.

The Queen came back to Paris on the 31st of October at the instance of the Parlement, but found there such a state of things that she fled a second time in the night of the 5th of January. She established herself at Saint-Germain with the little Louis XIV. This time Mademoiselle followed her. She had very uncomfortable lodgings at Saint-Germain, but she was "a creature . . . much above trifles." Curiously enough, the populace of Paris, which would not allow any vehicle to leave the capital for Saint-Germain, where the Queen and the Court were in need of everything, always allowed Mademoiselle's chariots a free passage. "The Queen and King," said she, "were in want of everything and I had all that I wished. For all the things which I sent for in Paris, passports were given and an escort; nothing could equal the civilities which were paid me." This quite consoled Mademoiselle; it became clear to her that such popularity marked her to become the wife of her young cousin and the Queen of France. When peace was signed between the Court and the Parlement, Mademoiselle returned to the Tuileries on the 8th of April, and was received with great demonstrations. The Queen brought back her son on the 18th of August, and the popular enthusiasm was at its height. Mazarin had the great success of the day; the people applauded him as a liberator.

After the Fronde of the Parlement came another Fronde, called the "Fronde des Princes." Mademoiselle had to follow the Court, which went from province to province in order to suppress the insurrections. She was at Libourne, with the Court, on the 1st of August, when she heard, to her great satisfaction, that her father had taken the part of mediator between the Court and the rebel princes. She became at once the most important person at court. The Queen showed her the dispatches, Mazarin affected to consult her; she had her own couriers from Paris. When Bordeaux was taken, the inhabitants had eyes only for her. "During the six days which were spent there by the Court," writes Mademoiselle, "nobody went to the Queen, and people did not care when she was in the street. I don't know whether she found it agreeable to hear that my court was full and that everybody was there, while nobody went to her." The Court stopped a few days in Fontainebleau before reentering Paris. Negotiations took place, in which Mazarin was sacrificed. It was agreed that the princes imprisoned at Vincennes and afterwards at Havre, among whom was the Prince de Condé, should be set free, and that Mazarin should be exiled. When Condé came back to Paris, Mademoiselle gives a curious account of her first meeting with him at the Luxembourg. She had always had a great aversion to him, but she now had an idea that, if the Princess de Condé, who was very ill, died, she might perhaps marry him:

"We mutually confessed the aversion we had always felt towards each other. He told me he was delighted when I had the smallpox, and hoped that I should always be marked with it, that I should have some deformity—in fact, that nothing could equal the hatred he felt for me. I admitted that I never felt so much joy as when he was put in prison, that I had longed for it, that I could not think of him except to wish him some evil. . . . These explanations lasted some time; they amused the company much, and ended in many assurances of friendship on both sides."

The Princess de Condé insisted on living, and Mademoiselle turned her eyes again on Louis XIV. Anne of Austria amused her with this idea, but never entertained it seriously.

During the year 1651, Mademoiselle spent her time in enjoying her popularity. She was anxious to find an occasion on which she might do something heroic. Condé was again at war; he had called the Spaniards to his aid, and was determined to keep Mazarin out of the kingdom. Retz and the bulk of the Frondeurs now stood by the Queen, and were even willing, for her sake, to recall Mazarin. The city of Orléans, which was in the *apanage* of Monsieur, was between two fires; it called Monsieur to the rescue—or Mademoiselle, his daughter. Her joy was boundless; she could now take part in the war. She organized a staff, she made herself a sort of uniform, and started for Orléans amid the applause of the people. She arrived on horseback on the 27th of March, 1652. The gates were shut and barricaded. She shouted who she was; the troops on the walls paid her military honors, but the gates were still shut. The inhabitants were afraid that an army would come in behind her. She turned the city, and, reaching the Loire, crossed it, and came to a gate on the quay. This she had broken open, and entered the city by a hole. She was at once borne in triumph; a company of soldiers accompanied her and her two ladies, Madame de Fiesque and Madame de Frontenac. Mademoiselle went to the Hôtel de Ville, made a fine speech to the authorities, and convoked a counsel of war.

On her return to Paris, she became a witness of the great battle of the Faubourg Saint-Antoine. Condé, who was hard pressed before the walls of Paris, called in Monsieur as his ally. Monsieur did not budge, but Mademoiselle, who, since she had taken Orléans, felt very heroic, went to the Fau-

bourg, turned the guns of Paris against the royal troops, and saved Condé. This exploit marked the end of the heroic part of her life.

We hope that Arvède Barine will soon give us as interesting an account of the second part of the life of this extraordinary person, who, with all her folly and vanity, is, nevertheless, worthy of some sympathy, and is, at any rate, a very original figure.

Correspondence.

WHAT HAS TAMED THE COLLEGES?

To the Editor of The Nation:

Sir: A newspaper item, lately noticed, relates to the deportation of students from Russian universities. Many scores, perhaps many hundreds, having been concerned in revolutionary demonstrations, have been sent to the army to serve terms of various lengths. The statement calls to mind the fact that students, as a class, have been restive under oppression. From the schools ardent and enthusiastic young men have swarmed out to do battle for liberty; their words and their works have stirred us deeply. When, just before the civil war, an oration, entitled "Italia Resurgens," was pronounced by one who afterwards commanded colored troops, he received such applause as had seldom been heard in the college church; and later, when the stress of the civil war was on us, self-surrender for principle was strikingly illustrated by the young men of the schools as singly, or in little groups, or, as in one case, in a full company, they entered the military service "to make men free." How fitting it would be that some adequate record of those words and deeds should be made.

And now, when the "avowed object" of a needless war is disregarded, when information in regard to our "criminal aggression" is denied to our people, in whose name the war is carried on; when the national Administration is adopting the measures of Lord North and George III.; and when American principles are again treated with insolence, as in the days of American slavery, it seems that some protest from the colleges is needed. John Fiske, speaking of the insignificant tax which was the occasion of the Revolutionary war, says: "The effect which a blow in the face would produce upon a barbarian, will be brought upon a civilized man by the assertion of some far-reaching legal principle, which only in a subtle and ultimate analysis includes the possibility of a blow in the face."

What has tamed the student body?

What has silenced the teaching force?

January 17, 1902.

THE PHILIPPINE SOLDIER'S RETURN.

To the Editor of The Nation:

Sir: In your No. 1904, under "The Week," appears a short article, concerning the soldier in his relation to the service in the Philippines, which shows such a marked misapprehension of the subject that I cannot but believe you will allow yourself to be set right.

The failure of soldiers to reënlist in the Philippines, and their desire to "get home," does not show "how utterly unattractive the *insular* conditions are." It would be the same under any conditions of climate and place. It is a well-known fact that soldiers, especially the youngsters that have gone into the ranks for the adventure of it (like most of those in the Philippines), like to go back to their homes and friends to tell their deeds. I have, in connection with the discharge of the late volunteer regiments, and of the regular soldiers being discharged at this camp, seen the discharge certificates of many thousand soldiers returned from the islands, and scarcely one of them all has not borne the names of one or more—usually several—actions, under the head of "Battles, Engagements, Skirmishes, and Expeditions," in which the soldier had taken part. Almost every man has been under fire one or several times, and he wants to go home and talk about it. After discharged soldiers have gone home and spent two or three months with their friends and kin, a large proportion of them are ready to "take on again."

And, further, the Department is experiencing no difficulty in enlisting men for service in the Philippines, although the same cannot be said with respect to the companies of seacoast artillery serving in the States.

It is, however, a pity that steps have not been taken to induce soldiers to reënlist in the Philippines. When the cost is considered of returning a soldier to the United States, and giving him his pay and allowances during the time consumed in the voyage, and the cost of recruiting a man to take his place, transporting him to the islands, and paying him for all this time lost, a bounty of say $500 would be a cheap price to pay every soldier that would reënlist and continue with his company in the islands—without taking into account the fact that a trained soldier would be gotten, instead of a raw recruit that is only a burden to his company and an expense to the Government for at least his first six months.

M. F. Steele,
Captain Sixth Cavalry.

Discharge Camp, Angel Island, Cal.,
January 8, 1902.

PRESIDENT McKINLEY AND THE WAR WITH SPAIN.

To the Editor of The Nation:

Sir: A hundred times I have pronounced the statement that the late President McKinley was forced into the attack on Spain against his will an absurdity. Now that it has appeared in the *Nation*, I am almost compelled to doubt my sanity. For nearly forty years now, the *Nation* has been to me Holy Scripture. I have accustomed myself seldom to confute, but always to understand, what I read in it. But this I cannot understand. It must be at least conceivable, but to me it is still inconceivable.

Did Mr. McKinley say so? That would be evidence that he thought so; but might he not have been laboring under a delusion? If the thing was impossible, he certainly was; if it was possible, then I suggest that we make it impossible by Constitutional amendment or otherwise, and that right soon. If it was true, then his subsequent conduct should be reconcilable with it; is it so? Let there be light.

Respectfully, Truthseeker.

Granville, O., January 15, 1902.

[The most direct and positive evidence on this question is the late Representative Boutelle's assertion that a belligerent group in the House "held a stop-watch over the President." This implies that there was a time when he was indisposed to go to war. His refusal to submit the cause of the *Maine's* destruction to arbitration—the last straw of drowning peace—marked the completeness of his surrender to the war-makers, and also of his assumption of moral responsibility for the ensuing hostilities. We will add our opinion that he still posed as a friend of peace after he had made up his mind to succumb—thereby lulling into fatal inactivity that part of the public which was revolted by the mere thought of war.—Ed. Nation.]

FACTS ABOUT THE ALASKAN BOUNDARY.

To the Editor of The Nation:

Sir: As Mr. Balch, in common with almost all the writers and speakers in this country who touch upon the matter, has much befogged the real points at issue, I earnestly hope that you will permit me, through your columns, to give a brief statement of the facts upon which Canada bases her claim. They are as follows:

(1.) That the strait now called Portland Channel, through which the United States have run their line of demarcation, is not, and cannot be, the Portland Channel referred to in the Anglo-Russian Convention of 1825, upon which the title of the United States to their Alaskan territory is founded; and that, in consequence of this erroneous assumption, Canada has been deprived of a large extent of territory rightfully belonging to her.

(2.) That, in running their line of demarcation ten marine leagues from the shores of every inlet that debouches from the sea-coast, instead of from the seacoast itself, the United States have violated the true intent of the treaty; these inlets being, in fact, but narrow fjords, only a few miles in width at their greatest extension, and in no sense being a part of the coast proper.

In support of the first contention, I would refer to the words of the treaty itself. In laying down the line of demarcation, it says:

"À partir du point le plus méridional de l'île dite Prince of Wales, lequel point se trouve sous le parallèle du 54me degré 40 minutes de latitude nord, et entre le 131me et le 133me degré de longitude ouest, la dite ligne remontera au nord le long de la passe dite Portland Channel, jusqu'au point de la terre ferme où elle atteint le 56me degré de latitude nord; de ce dernier point la ligne de démarcation suivra la crête des montagnes situées parallèlement à la côte, jusqu'au point d'intersection du 141me degré de longitude ouest, etc."

Now I affirm that no unprejudiced person who reads the above and afterwards consults a map of the territory involved, can say that they furnish sufficient evidence to establish the claim of the United States.

By the terms of the treaty, the line of demarcation is to begin at the southernmost point of the Prince of Wales Island; from that point it is to *ascend* to the north along a strait called Portland Channel until it

reaches a point on the mainland where it attains the 56th degree of north latitude. Does the line as laid down by the United States do this? Not by any manner of means! Instead of ascending to the north, as the treaty says it shall do, it actually *descends*, passing along a line *a little south of east*, for a distance of *one hundred and thirty miles!* Then, and then only, it begins to meander northward.

So far, it must be clear to the unprejudiced investigator that there is something wrong either with the treaty or with the American interpretation thereof. Let us see, then, what other interpretation is possible and reasonable.

Turn again to the map, and place one end of a ruler upon the southernmost point of Prince of Wales Island, which, as we have seen, is the place where the line of demarcation begins, the other end pointing northward. It will be seen that it follows very nearly the course of the eastern arm of a channel marked upon some maps as "Clarence Strait." This channel actually terminates at the prescribed latitude of 56 degrees north, which the one now called Portland does not. I say it will be found that the ruler very nearly follows the course of this channel; it does not quite, for it cuts off some outlying edges of the island. It is this fact which furnishes one of the strongest proofs of the correctness of Canada's claim. Taken in connection with a clause of the treaty which provides "que l'île dite Prince of Wales appartiendra toute entière à la Russe," it shows almost conclusively that this strait, and not the one now so designated, was referred to in the treaty by the name of "Portland Channel."

The only possible explanation of this clause is that the line of demarcation as laid down in the treaty, if strictly followed, would leave some part of the island outside of the territory assigned to Russia, and therefore this provision was inserted in order that it might retain the whole. This explanation accords with the hypothesis that the line of demarcation was intended to pass through the strait now called "Clarence," and not the one now called "Portland," for if the line ran through the latter, there would be no need of a special clause to preserve the whole island to Russia, for every part of it would be at least a hundred miles inside the territory assigned to that country.

With regard to the second contention on behalf of Canada, the question turns upon the true meaning of the word "sinuosities" which occurs in the treaty. Does it mean, as is claimed it does by Canada, that the line shall follow the coast proper, or that it shall follow up every narrow inlet, one of which at least runs into the mainland for over a hundred miles, and the upper part of which no more resembles the sea-coast than do the Palisades of the Hudson? This second contention is also strengthened by a clause in the treaty which grants to Great Britain the right to "free navigation" of all these inlets. Of what use would this be did she not own their upper reaches?

As to the first, it is not at all unlikely that the name Portland Channel was anciently applied to a different strait from the one now known by that name. A similar confusion occurred many years ago when, in an attempt to delineate the boundary line between the United States and British possessions, the question arose as to what was the stream referred to in the treaty by the name of St. Croix River. The dispute was settled to the satisfaction of both parties.

Mr. Balch claims, as other writers and speakers have done, that the United States is "entitled by long uninterrupted occupancy to an unbroken strip of territory on the mainland, etc." If my memory serves me aright, a similar claim was set up on behalf of Great Britain in the Venezuelan matter, which claim was received with indignant remonstrance in this country as being an instance of British arrogance. America of course is incapable of arrogance. In any case this plea is beside the question, for there happens to be a clause in the treaty made to fit this possibility, which clause expressly denies prescriptive rights to either party.

I am, Mr. Editor, respectfully yours,

ARTHUR JOHNSTON.

SANTA ANA, CAL., January 8, 1902.

Notes.

Mr. John Lane's spring announcements include a two-volume edition of the poems of Arthur Symons; a limited edition of a three-volume edition of Shelley's poems, uniform with Keats's, printed in the Vale type; 'A Garden in the Suburbs,' by Mrs. Leslie Williams; and 'The Book of Bulbs.'

From Doubleday, Page & Co. we are to have 'An Introduction to the Study of English Poetry,' by Prof. Mark H. Liddell; 'The Life of James Madison,' by Gaillard Hunt; and 'A Retrospect of Some Literary Immortals,' by Francis W. Halsey.

A. C. McClurg & Co. will publish 'Ocean to Ocean,' a narrative of a surveying trip across Nicaragua, by Lieut. James G. Walker, U. S. N.; and a new edition of Sheldon's 'Notes on the Nicaragua Canal'; 'Nestlings of Forest and Marsh,' by Mrs. Irene Wheelock; a volume of literary essays by William Morton Payne; 'Letters to an Enthusiast,' by Mary Cowden Clarke; a 'Selection of the World's Greatest Short Stories,' by Sherwin Cody; and 'Right Reading,' a body of counsel selected from ten famous authors.

'The Ancient Catholic Church' (to A. D. 451), by Dr. Robert Rainy, principal of the New College, Edinburgh, and 'Philosophy of Conduct,' by Prof. George T. Ladd of Yale, are in the press of Charles Scribner's Sons.

P. Blakiston's Son & Co., as American agents, announce an important undertaking to cover five years, namely, 'An Atlas of Clinical Medicine, Surgery, and Pathology,' which will be issued in quarterly parts—eight to ten plates at a time—in connection with the regular publications of the New Sydenham Society.

D. C. Heath & Co., Boston, will issue directly Renan's 'Souvenirs d'Enfance et de Jeunesse,' annotated by Irving Babbitt, primarily for college use, but also to the advantage of the general reader.

Mr. Nathan Haskell Dole is preparing a revised bibliography of the translations or other editions of the Rubáiyát of Omar Khayyám, to be included in a new issue of the "Multivariorum Edition" published by L. C. Page & Co. He would be grateful for any information regarding any editions, or magazine articles containing longer or shorter selections from the works of the astronomer poet, whether in English or in foreign languages. Letters should be addressed to him at Jamaica Plain, Mass.

'The Love Poems of Sir John Suckling' is the latest issue in John Lane's "The Lovers' Library," small, companionable volumes takingly furnished with text printed in one color (here green) and framed in another (here violet), and as daintily bound. We could have desired a modernizing of the punctuation.

Lovers of Dicky Doyle will welcome the reprint of Thackeray's 'The Newcomes' that comes to us from Macmillan with that genial artist's illustrations, both in the letter-press and on the wrapper and title-pages of the 1853 edition. They have a certain affinity with Thackeray's own ingenuous designs, but the author could not have produced the hustings riot on page 745, nor given the same decorative charm to the initial letters which introduce every chapter. With 844 pages the volume is still not unduly bulky, nor is the print difficult to read.

The useful "Künstler-Monographien" (Leipzig: Velhagen & Klasing; New York: Lemcke & Buechner) are increased by a 'Burne-Jones' and a 'Herkomer,' truly a strange pair to be assembled if only by the hazard of a publisher's convenience. These books contain, as is the custom of the series, each more than a hundred illustrations. Ludwig Pietsch celebrates the qualities of Hubert Herkomer in terms of extravagant appreciation; for it is not likely that this versatile artist will ever be mentioned "among the greatest names which have given to the art of the nineteenth century its most illustrious renown." Herr von Schleinitz discusses the works of the late Burne-Jones in a more judicial spirit. Either volume is commendable as a convenient collection of pictures otherwise accessible only in far more expensive form.

The extraordinary alliance which subsists between the republic of France and the empire of Russia naturally raises economic questions of great interest to the French people. Some of these questions are examined by M. J. Machat, in a study entitled 'Le Développement Économique de la Russie' (Paris: Armand Colin). There is no doubt that a considerable amount of foreign capital has lately been invested in Russia; the protective tariff operating as a bounty on such investments. M. Machat determines statistically their extent and their productiveness; but his aim is wider than this. He takes, in the first place, a comprehensive view of the resources of Russia and the conditions of its development, and then proceeds to examine specifically the mineral wealth and its exploitation, the agriculture, the manufactures, the transportation, etc. The results are certainly impressive, but we have no confidence in the methods by which they are obtained. Reliance is placed throughout on the figures given in the reports of the various bureaus of the Russian Government. We know enough of the corruption of that Government to make us doubt whether its functionaries are competent to carry out statistical inquiries with scientific accuracy. There may be 33,000,000 horses and 75,000,000 sheep in Russia, but

the figures cannot be verified. M. Machat himself says of the number of the sheep, "Négligeons comme trop problématique le chiffre global." Nevertheless, we are bound to say that he does the best with his material, and his book deserves attention.

In his history of the Netherlands people ('Geschiedenis van het Nederlandsche Volk,' Groningen: J. B. Wolters), Dr. P. J. Blok, Professor of Dutch history in the University of Leyden, has now completed his fifth volume, which, as usual, comes well indexed and has two colored maps. The latter show the republic as it existed from the peace of Münster in 1648 to the last years of William the Third, King of England and Stadholder of the Netherlands; and the North Sea and English Channel, well marked by the sites of naval battles. The period treated, from 1648 to 1702, was the time of John De Witt and of William the Third, the era of the naval wars of Holland with England, of the culmination of the power of the republic, and of the coalition wars against absolutism and Louis XIV. We reserve comment for the English translation, which we suppose to be in progress.

A publication of great interest to students of Germanic philology in general, and Scandinavian philology in particular, has just been completed in Copenhagen, being the new four-volume edition of Snorri Sturluson's 'Heimskringla,' which has been (since 1893) in course of preparation and publication for the Society for Publication of Old Northern Literature by Finnur Jónsson. The famous Icelandic author's classical work is here for the first time published in full accordance with the best manuscript, the *Kringla*, as it now exists in the paper copy made by Asgeir Jónsson about the year 1700; the original vellum—with the exception of a couple of sheets that in some mysterious manner found their way to Stockholm—having been destroyed in the great Copenhagen conflagration of 1728. A full set of notes gives sufficient information about the variants presented by the other versions of Snorri's work. The fourth volume of the present edition consists of an interpretation of all the Scaldic verses quoted in the several Kings' sagas. The learned Icelandic editor is, beyond dispute, the first living authority in the field of Scaldic interpretation, and there seems to be no limit to his productive capacity. While this edition of Snorri's work has been going on, he has been constantly engaged on his great History of the Old Norwegian and Old Icelandic Literature, of which the first instalment also appeared in 1893, and which will soon be finished, while as side issues, so to say, he has, like a clever prestidigitator, shaken out of his sleeves editions of old sagas, reviews, and essays, pamphlets and criticisms almost without number. Hence it is no wonder that the same package of the Society's publications that brings the last number of his edition of Snorri, also contains an essay by Finnur Jónsson on the Norwegian-Icelandic Scaldic language of about 800-1300.

It may not be out of place to mention here the version of the 'Heimskringla' by Dr. Gustav Storm, recently published in Christiania. As a translation from Icelandic into modern Dano-Norwegian, it can hardly be expected to excite much interest outside of the country of its production; but the fact that it has been illustrated by several of the most prominent Norwegian painters under the editorship of G. Munthe makes it notable on the artistic side, in spite of a doubt whether the designers have been entirely successful in their endeavor. Of this translation there have appeared three distinct editions—one of them, with the assistance of the public treasury, simultaneously with a translation into Landsmaal by S. Schjött, illustrated by the same artists, and extremely cheap. That Storm's translation has a specific, philological value, it is not necessary here to insist upon.

An important work, 'Francesco Pesellino und die Romantik der Renaissance, von Werner Weisbach,' in preparation during the past year by Bruno Cassirer, Berlin (New York: Lemcke & Buechner), with abundant illustrations adapted to a folio page, offers an attraction to Petrarchists on account of the light thrown on the rise and spread of the "Illustrationscyklus" of the "Trionfi."

The pathetic story 'Le Mie Prigioni' will long keep alive the memory of Silvio Pellico as writer and poet, while as patriot he would even now be remembered but by few. The principal charm of the story consists in its temperate tone and apparent truthfulness—qualities which at once made Prince Metternich recognize in the book a source of serious political danger. That Silvio Pellico actually did not exaggerate, that he rather "slightly idealized, his situation during the first period" of his captivity, has now been established beyond a doubt by an examination of official documents in the Vienna archives, a partial account of which is published in the January *Rundschau*. But, aside from this confirmatory evidence, the study of the state papers has led to some important discoveries. Thus, the current assumption that the liberation of Pellico and some of his fellow-sufferers was due to the outbreak of the July Revolution is proved to be erroneous, the fact being that the news of that event came very near causing the revocation of the pardon already granted and partly carried into effect. A more interesting question concerns the fate of several of Pellico's manuscripts, which were confiscated and for many years kept by the authorities in Vienna. The complete official list of them is given in the *Rundschau*. Of the thirteen titles only three appear in Pellico's published works. Whether all of them reached their rightful owner when, four years after his release from the Spielberg, his papers were returned to him, is even now uncertain. So much is sure, that Maroncelli was justified in saying, in 1834, in his 'Addizioni': "Ma la non-restituzione delle carte di Silvio defrauda irreparabilmente uomini e lettere." It seems that this reproach rests even to the present day upon the Austrian Government.

Consular Reports for January contains translations of the official regulations for the reorganization of the Government of China on more modern and efficient lines, and two imperial edicts on education. These provide for the establishing of schools throughout the empire, and order the viceroys and governors to select and send students abroad for the purpose of being educated in special branches of industrial science. Considerable space is devoted to a review of the foreign commerce of Germany for 1900, from which it appears that the United States has by far the largest and most valuable export trade to Germany, while it stands third in respect to the bulk and value of imports from Germany—the total value of both exports and imports being, in round numbers, $350,000,000. For the first six months of 1901 the statistics show an increase in the exports of American cereals and some other articles, and a decline in the exports of cotton and copper. Some interesting statements follow in regard to the present condition of the various German industries, and the effect upon them of American competition, and on the proposed tariff revision. Among other things it is said that "the cost of living is at present from 10 to 50 per cent. higher than in the United States, while wages are about one-third of those paid at home."

The Baltimore Association for the Promotion of the University Education of Women, through a circular dated January 10, offers to properly qualified college graduates—*i. e.*, "candidates who give promise of distinction in the subjects to which they devote themselves"—a fellowship of $500 for the year 1902-03. Preference will be given, in the award of this fellowship, to women from Maryland and the South. Blank forms for application may be obtained from Miss McLane, No. 1101 N. Charles St., Baltimore, or from any member of the Committee on Award, and should be presented on or before March 25. This fellowship may, in exceptional instances, be held for two successive years by the same person, and work on it may be pursued at a European or American university.

The experience of Massachusetts is being invoked to rescue from destruction, decay, or peril of both, the local archives of the State of New York. The mover in this is the Public Archives Commission of the American Historical Association, as appears from a leaflet just sent out by Prof. Herbert L. Osgood of Columbia University. "Two towns [of Onondaga County]," we read, "have deliberately burned their old material, and others may be expected to follow the example from time to time." A State Record Commission is the proposed remedy.

A chased silver inkstand was lately presented by the employees of the National Central Library, in Florence, to their honored chief, Commendatore Chilovi, in token of forty years' service, completed on December 15, 1901, and the hope was expressed that he might retain the chief librarianship till the long-deferred new building should become the fitting home of the overgrown collection. The sub-librarian, Signora Castellano-Teloni, had a word of praise for his good will ever manifested toward her sex. Professors Robert Davidson and Heinrich Brockhaus celebrated the pleasant occasion with gifts (statuary and a manuscript).

The anti-foreigner agitation in the higher institutions of learning in Germany is assuming larger proportions. It is directed chiefly against the Russians, and is based on the fact that so many of these, especially the women, are so poorly prepared that they retard the progress of others in the same department. The first steps in the direction of making it impossible for incompetent foreigners to enter these schools came from the Polytechnic Institute in Munich, and were followed by an appeal for redress from the university men at Heidelberg.

Now a particularly strong protest has come from the medical men at Halle, who state, among other things, that, out of about one hundred in the dissecting department, there are four Russian men and twenty-nine Russian women, nearly all Jews, and that in most cases they are incompetent and socially very objectionable. The students ask for more stringent conditions of admittance to the institutions. The agitation has also spread to Leipzig and Berlin. In the former university the authorities decided not to admit foreigners insufficiently prepared, and in particular that the certificate of the so-called "Girls' Gymnasia" of Russia should no longer be recognized. In Berlin a mass-meeting of the German students, called to protest against the conduct of Polish students who had disturbed the lectures of Professor Schiemann for his having taken an anti-Polish view of the revolution of 1830, resulted in a petition to the authorities that only such non-German students be admitted to university privileges as are ready for academic work. In Brunswick the officials of the Polytechnicum have published a decree that no foreigner shall be admitted unless he have a fair understanding of German.

By a certain historic right, the octogenarian Mommsen, who has always been on the alert whenever university rights and privileges were endangered, is leading in a protest for the independence of German university scholarship, which has been endangered by the action of the Emperor in appointing a distinctively "Catholic" professor of secular history to the philosophical faculty of Strassburg, in the person of Dr. Spahn, a son of the noted Catholic political leader in Parliament. In his "open letter," Mommsen calls this a "confessionalizing" of scientific research, and the establishment of a precedent fatal to the spirit and highest ideals of scholarship. Fully a dozen university faculties have joined in this protest, but these voices have come chiefly from South Germany, the Prussian university faculties seeming to fear the vengeance of the authorities, particularly as the Emperor himself had been so active in dividing the work of history at Strassburg between a Protestant and a Catholic holder of the same chair, where there was formerly but one man. Of Prussian universities, only Kiel and Breslau had the courage to protest. An answer to Mommsen has been published by the leader of Catholic learning in Germany, Count von Hertling, who insists that no scientific research can be or ever is absolutely free from assumptions (*voraussetzungslos*). The discussion has assumed national proportions, and is calling forth expressions from many leaders in university circles.

The German Asiatic Society of Japan, which meets usually in Tokio, and is composed of scholarly and industrious men from the Fatherland, has done noble work in the study of Japanese history, music, science, literature, art, and mythology, and in making known the peculiar traits of the country and people. Already its extremely valuable publications (*Mitteilungen*) have reached eight volumes. Full of interesting matter accurately set forth, instead of the old form of publication, with pages 12x8 inches in size, the more recent volumes have taken the more convenient shape of 8½x6 inches, and the paper is of an improved quality. A striking feature is that of liberal illustration by Japanese artists. Part ii. of volume viii. contains a valuable engineering paper on "The Railways of Japan," one on the "Feast of Bon, or of Floating Lanterns in Memory of the Dead," in which, also, the features of amusements and dances and even small boys' mischief are not forgotten. Professor Aoyama writes of the plague, from a bacteriological point of view, and the Rev. A. Lloyd treats in scholarly fashion of the Dogmatic Anthropology with which Buddhism so fully deals. Two of the papers are well illustrated. As a supplement, we have a limpid translation into German, with abundant and scholarly notes, by Dr. Karl Florenz, Professor of Literature in the Imperial University, of the classic 'Nihongi' (Chronicles of Japan), written in 820 A.D., together with an index and many illustrations of incidents and antiquities, making a thesaurus of learning without knowledge of which no one can presume to be informed about Japan's early history.

—The fourth volume of the 'Letters to Washington' (Houghton, Mifflin & Co.) carries the correspondence to May, 1774. The absence of an index to the four volumes would show that the Colonial Dames have extended the original plan, and do not intend to limit the series to letters written in colonial times. We trust that this is their decision, for the matter thus published will always be of interest, and is now so widely scattered in so many volumes as to defy research. Force printed in his 'American Archives' such letters from the Washington collection as pertained to the two years covered by his compilation; but this work is not readily consulted, and, being somewhat hastily gathered, shows many serious omissions. The personal element of the letters will give place to the military relations, and much more careful editing will be demanded. Yet, should the volumes be continued, the entire series will be the strongest possible argument in favor of the existence of such a society as that of the Colonial Dames. The neglect shown by the Government of its opportunity, almost its duty, regarding this correspondence, is being compensated by the patriotic efforts of the above society, and a worthy form is now given to material that has not lost its historical value or its personal interest.

—The volume before us contains two series of letters which have already been printed—the Boucher and the Crawford letters. The one relates to the education of young Custis, and throws not a little light on the condition of the colleges of that day; the other turns on Washington's speculations in Western lands, and proves at once his keenness and his eagerness to secure the best. The complicated Colville estate, a part of the management falling upon Washington, involved him in many perplexities, and gave rise to the curious story of his "defalcation." Troublesome, too, was a Mrs. Savage, whom Mercer described as "at the tender Age of three score and ten, denied the Use of Pen Ink Paper & Romances, and a frequent Use of the Strap is substituted in the Place of these Amusements." John Posey, a worthless farmer, was an object of Washington's charity. But the most interesting features of the book will be found in the letters from the overseers of the different plantations belonging to Washington, for they clearly reveal the infinite detail incident to careful management. The tobacco crop was ceasing to be the great commercial crop, and was being replaced by the cultivation of wheat and export of flour to the West Indies and Europe. The mill was an important article in farm economy, and its management demanded better labor than could easily be obtained anywhere in Virginia. The raising of hogs, the profits of the fisheries, the spinning of wool by the sickly negroes, and the demand for farm horses required minute supervision to prevent waste, and the letters from Hill, in old Virginia, and from Simpson, on the Ohio, tell much the same story, save that in the newer region the slave was even at this early period at a disadvantage. The free white was in demand.

—As a commentary on Shakspere, the Oxford English Dictionary can be evaluated only by students. Not all of them are above the error of reading with a modern sense familiar words used by the poet and his contemporaries with quite another connotation. Such words will never be looked up in this Dictionary by the ordinary reader. Notoriously, Dr. Murray's colaborers have failed to explain away every stumbling-block of nonce-words or various puzzling lections; but occasionally they have been able to rebuke accepted emendation and restore the original text. An instance of this occurs in the quarterly issue (Lap-Leisurely) just issued by Henry Frowde. The word "legative" in "Henry VIII.," III. ii. 339, "By your power Legatiue," is maintained as against the "legantine" of modern editions. Per contra, an erratum in Spenser's 'Faerie Queen,' confessed in early editions among "Faults escap'd in the Printing," but overlooked by subsequent editors, introduced a spurious word "lastery" for "castory" into our vocabularies. Milton's true text, again, "I owe no light or leading received from any man in the discovery of the truth," is set over against Burke's manufacture of it into a familiar quotation — the "men . . . of light and leading" in England. Pope's "leather and prunella," in allusion by rank to cobbler and parson (whose gown was made of prunella), has similarly undergone a sea change to make it a current counter of speech, with the meaning 'something to which one is utterly indifferent.' The proverbial expression, "There is nothing like leather," has not been traced beyond Fenning's 'Universal Spelling - book' (1767). "Leatherette" bears the approximate date 1880. "Leap-frog" makes its first appearance in Shakspere (1599), in Henry V. "In the lead" is an American expression; and this substantive, though old and well supported in English usage, was branded by Dr. Johnson as a "low, despicable word." "Launderer" we have retained, though it is obsolete in England after occurring as early as 1475. "Lay of the land" (for "lie") is cited from Thoreau without animadversion as an Americanism; and indeed "lay of the country" is adduced from an English author in 1819.

—The moot order of "last two" versus "two last" (and the like) is thus noticed by Mr. Bradley: "The more frequent form till the seventeenth century appears to be *the two* (*three*, etc.) last (=F. *les deux derniers*,

G. *die zwei letzten*); . . . the form *the last two* (*three*, etc.) is now the more frequent of the two, except where *last* is equivalent to 'last-mentioned.'" "Last day" for yesterday is still in dialect use, and we have held on to "last evening"; but "last morning" has been given up. Some other relinquishments in this section of the alphabet might also be regretted, as "largerly (largierly)," "latewardly," and "leggiadrous" ('graceful,' 'elegant'), which Petrarch-fed poets, lamenting Laura's "leggiadro portamento altero," might have naturalized from the Italian. When the Gallicism "leaves something to be desired" was first ventured is not established in the Dictionary by example. "By your leave" relates not to permission, but to good pleasure (love, lief). Sharp division in British usage is manifested in the case of "lass," which is in full vogue in northern and northern midland Britain, but has little or no popular currency in southern. The historical side of the Dictionary is illustrated conspicuously under "Law," where are defined Avrogado's law, Boyle's, Gresham's, Grimm's, Verner's, etc. And speaking of law, we should say that in this country one would oftenest hear "learn'd in the law"; but Mr. Bradley recognizes only the dissyllabic pronunciation. Conversely, he has "legg'd" only, whereas we should ordinarily expect to hear "a one-legged man," for instance.

—A valuable supplement to the now numerous critical studies of Ibsen is furnished by J. B. Halvorsen's 'Bibliographical Information concerning Henrik Ibsen's Collected Works,' which was published by Gyldendal of Copenhagen in 1901. At the time of the author's death in February, 1900, the material for all but the last six dramas treated was ready for the press. The task of preparing the remainder, upon the basis of Halvorsen's collections, and following closely his method, was undertaken by his friend, Sten Konow. The plan of the book is briefly as follows: The works are taken up in the chronological order of their publication. A brief general account is followed by a list of editions in the original, accompanied by interesting details about the number of copies printed, etc. Then follow foreign translations and commentaries, concluding with a list of performances, in both Europe and America. Completeness has been aimed at in the account of editions and translations; in the last two items named above only an approximation at completeness outside of Scandinavia is possible. The only marked deficiency in the commentaries is the omission of some valuable English and American criticisms. No mention is made of Payne's translation of Henrik Jæger's 'Ibsen.' Of special interest, as giving less familiar facts, is the section dealing with Ibsen's poems, the first edition of which appeared in 1871. The large number of these poems translated into Polish is noticeable, the reason for it probably being Ibsen's warm love of liberty. One of the verses, written originally in German, and addressed to a German lady, contains a suggestive little piece of self-criticism. It will probably be a source of surprise to most American readers to learn that the first performance of "Ghosts" was given by a Dano-Norwegian company in Chicago, in May, 1882, a month before the earliest performance in Germany, and more than a year before the play was produced anywhere in Scandinavia. The only performances of "Emperor and Galilean" were given in 1883 at Leipzig and in 1888 at Berlin. The only performance of Ibsen's first play, "Catilina," that is noted was at Stockholm, December 3, 1881. The one serious fault to be found with Halvorsen's admirable bibliography is that it is presented in Danish, but this can be readily rectified.

—The decease in Japan of Dr. Stuart Eldredge, on November 16, at Yokohama, and of Mr. Edward Howard House in Tokio on December 18, deprives the American community of two notable men resident in Japan for more than thirty years. The one was an ornament to medical science, the other to letters and music. Both were deeply beloved by the Japanese, besides being the recipients of imperial favor in the form of decorations. On Dr. Eldredge was bestowed the third class of the Order of Merit, on Mr. House the second-class order of the Sacred Treasure. The latter, born in Boston in 1836, followed at first his father's occupation of bank-note engraver, but in the early fifties entered journalism and became a musical and dramatic critic in New York city. As correspondent, he reported the John Brown episode at Harper's Ferry, and later the war campaigns. Mr. House was fairly successful as a playwriter in collaboration with Dion Boucicault, but, since 1870, had spent most of his life in Japan, teaching English in the University and conducting the Tokio *Times* from 1877 to 1880. By his vigorous writing, he was influential in rousing the public sentiment in America and Europe through which Japan ultimately gained her sovereign rights as a nation. His pamphlets on the Kagoshima and Shimonoseki affairs were especially illuminating. Though crippled by gout for more than twenty years, he contributed steadily to the magazines. He accompanied the Japanese army, under Gen. Saigo, to Formosa in 1874, and wrote a full account of that expedition which powerfully affected modern history in the Far East. 'Yone Santo, a Tale of Japan,' and 'Japanese Episodes,' touch the lighter side of native life. His latest and greatest musical triumph (he held the degree of Mus. Doc. from Oxford) was the organization of an Imperial Court orchestra of Japanese young men, which, in 1900-1901, gave creditable performances, the first of the sort in Japan.

LANCIANI'S OLD ROME.

New Tales of Old Rome. By Rodolfo Lanciani. Illustrated. Boston: Houghton, Mifflin & Co. 1901.

It is a matter of great importance for an archæologist to consider how freely he may give rein to his imagination, particularly when sentiment enters largely into his disposition and is exaggerated by circumstances of birth and environment. Lanciani is one of the great students of Roman classical antiquity. Possessed of broad knowledge of his subject, with a mind keen to the possibilities of every discovery, no matter how apparently insignificant, with an imagination ready to supply all the missing links, and with a sentiment fired by a love for the imperial city, our author has written upon a subject musty with the dust of ages a number of books which have a wondrous charm. Nevertheless, these same books give the reader a sense of insecurity, and inspire a fear lest the fair structure may have been founded and framed by the imagination of the enthusiastic scholar. The latest is no exception in this respect. In a beautiful volume of three hundred and thirty-six pages, entitled 'New Tales of Old Rome,' the author has brought together eight essays upon subjects which are related only in so far as they have to do with Rome. Two are concerned with the recent discoveries in the Forum and along the Sacra Via, one treats of the grove and inscriptions of the Arval Brotherhood, another considers the mystery surrounding the Grave of St. Paul, the fifth is entitled "Strange Superstitions in Rome." The last three relate interesting details as to the memorials of the Jews, the English, and the Scotch which are found in Rome.

Naturally we turn with special interest to the essay describing the recent discoveries in the Forum which have stirred the curiosity of the entire world, and have turned the eyes of students and laymen to the little area, near the arch of Septimius Severus, which was the Comitium of ancient Rome. To Professor Lanciani the famous but now generally discredited *lapis niger* indicates the tomb of Romulus, the founder of the city. The black stones may not be the identical slabs set up in the Comitium in the time of the kings, and may have been placed by Diocletian, but they mark the tomb of Romulus; and the sub-structure, with its *fossa* and oblong pedestals for the lions, and the conical-shaped pillar and pyramidal stone engraved with archaic letters standing near by, form a "venerable monument raised in honor of the founder of the city not long after his death." The mutilation which they show is "the palpable speaking evidence of the storming and sacking of Rome by the Gauls in 390 B. C." The pillar is only another evidence that this is the tomb of Romulus, for it resembles the "naval pillar of Duilius," and that of Numidian marble inscribed *parenti patriae* in honor of Cæsar. Then the inscribed stele, "still standing after twenty-five centuries in the identical spot where one of the kings set it up," escaped the destruction of the Gaulish fire of 390 B. C. "It contains a pontifical law specifying the ritual of certain public sacrifices, and it appears as if Livy must have had this stele before his eyes, or fresh in his memory, when he wrote the well-known passage in the twentieth chapter of Book I." The interpretation of the inscription, as given by Professor Ceci and published in the *Notizie degli Scavi* some months ago, is put in English form by the author.

Now all this forms a most delightful story, and we only wish we could say it were all true, but it is mostly pure assumption, and is built on the following remarkable facts. On the site of the old Comitium in the Roman Forum there have recently been discovered, below the recognized level of the imperial period, slabs of black marble, covering what is apparently a shrine, the purpose of which is unknown. All that can be safely said is, that Maxentius probably built this monument in honor of his son Romulus, being desirous of recalling the founder of the city and associating him with his son of the same name. The most important object discovered is the stele, upon which is inscribed what is undoubtedly the oldest Latin inscription in existence. There is nothing,

however, about the stone to prove that it was set up in the time of the kings. The archaic letters are similar in form to the Greek alphabet on the Formello vase, at the date of which the Romans were borrowing that alphabet for their own written language. Of the inscription not more than half a dozen words can be recognized, and we can only say that the language refers in some way to the *rex sacrificulus*, who presided in the *comitia calata* for the making of wills. Professor Ceci's interpretation is an invention, and, although ingenious, does not deserve recognition in a work of any authority. In stating that the Duenos bowl was the oldest Latin inscription before the discovery of the stele, Professor Lanciani has overlooked the Fibula Prænestina. The Prænestine brooch has an inscription in retrograde order, the letters of which closely resemble those on the stele, and there is the same three-pointed form of punctuation. Both inscriptions date in the same period, perhaps in the seventh or sixth century B. C.

It is very probable that the Latin people obtained their alphabet from the Chalcidian colony of Cumæ, and our author should not have said that this theory had been abandoned, even though it enabled him to introduce the fanciful derivation of *cœrimonium*. The inscription on the stele shows the alternating direct and retrograde order styled "boustrophedon." This combined order is the medium of change from the retrograde to the direct, and, since the discovery of the Fibula Prænestina with its retrograde form, has been thought to have been used by the Latins, though no evidence has been discovered before this time. The Etruscans, Umbrians, and Oscans did not use the alternating order inasmuch as they always wrote from right to left.

Professor Lanciani, when speaking of the work of Maxentius in the Forum, makes the suggestion that the newly discovered pedestal upon which was engraved the inscription, "To Mars the invincible father and to the founders of his eternal city," once supported the famous bronze wolf which has been popularly identified with the statue struck by lightning in B. C. 64, since the right hind leg shows an injury of some kind. The latter part of this chapter treats of the origin of Pasquino, upon whose statue were posted epigrams and mottoes, a custom giving rise to the word pasquinades. What this has to do with the new discoveries in the Forum it is impossible to say, for the "battered torso" dubbed Pasquino was discovered as early as the fifteenth century.

Under the heading "The New Discoveries on the Sacra Via," Professor Lanciani describes the Fasti which were placed on the walls of the Regia. When speaking of the Atrium of Vesta, he contradicts, though with regret, the theory that the mutilated statue of a Vestal found three feet below the floor of the Atrium was buried thus, to complete the disgrace of the priestess, whose name had been erased from a pedestal perhaps because she became a Christian. Nevertheless, he thinks that this proselyte was the Claudia named by Prudentius, since the name began with a C, which is all that remains of the inscription.

Suetonius tells us of the erection of the marble column in honor of Cæsar on the site of his funeral pyre. At its base was set an altar which, together with the pillar, was thrown down by Dolabella, son-in-law of Cicero. Fragments of the column still remain, and mark the spot where "the great man was incinerated." The description of the laying bare of the pavement of the Sacred Way and the *clivus* of "Commodus or Domitian" gives an opportunity for the introduction of the story of Simon the Magician and St. Peter. The chapter assigned to the Sacred Grove of the Arvales consists of thirty-eight pages, only fourteen of which treat of the subject. Under this title we find mention of the terminal gods, and the evolution of the shapeless boundary stones into the Hermæ of later times, and the discovery of pedestals of portrait busts, which bear the names of Bacchylides and Pindar. The chapter closes with a description of sacred groves, and in particular that of Annia Regilla, still surviving under the name "Bosco Sacro."

Professor Lanciani opens the chapter on "The Truth about the Grave of St. Paul" by a description of the Basilica Aemilia rebuilt by L. Paullus, a fact recorded by a recently found fragment *Paul(us) rest(ituit)*; and he states clearly his belief that the columns of Phrygian marble of the Church of St. Paul on the road to Ostia were taken from the old Basilica, because it was levelled to the ground at the close of the fourth century, at the precise time when the Church was built. It was natural that materials from the Basilica Aemilia (Paulli) should be used in the Church of the Apostle of the same name because of the custom of the Christians of "placing pagan buildings under the care of saints whose names sounded more or less like those of the gods just expelled." De Rossi thinks both buildings stood at the same time, and refers to two dog-collars with inscriptions which mention the two buildings. The opinion of the author as to the mysterious grave is summed up in these words: "The grave of St. Paul has come down to us, most likely as left by Constantine the Great, enclosed in a metal case. The Saracens of 846 damaged the outside marble casing and the marble epitaph, but did not reach the grave. As to the nature of the grave itself, its shape, its aspect, its contents, I am afraid our curiosity will never be satisfied."

The strange superstitions that claim attention in the next chapter are those associated with the worship of Cybele, Mithras, and Artemis Taurica. Many sanctuaries for the worship of Mithras have been found and explored in Rome and vicinity, the best known of which is the cave of the Capitoline Hill, discovered in the sixteenth century, and named Lo Perso by reason of the Persian origin of Mithras, and which contained the famous bas-relief showing the *taurobolium*. The ancient ships now at the bottom of Lake Nemi Professor Lanciani believes to have been used for religious purposes, in connection with the sanctuary of Artemis Taurica on the shore. It has always been a mystery what the purpose of these vessels, two hundred feet long and sixty feet broad on a lake of a diameter of four thousand feet, might have been.

It is a matter of regret that the chapter on Jewish memorials in Rome opens with references whose authenticity the author himself questions. There is no reason to believe that the sarcophagus with labels incribed in the twelfth century really contained the bones of the Maccabees who came to Rome in the second century B. C., nor can we believe that the *princeps libertinorum* of Pompeii was the "Rabbi of the local Pompeian synagogue." The Horti Lamiani mentioned because of Caligula's affront to the Jews are described in a most entertaining way. The Arch of Titus with its reliefs, the triumphal gate of the Circus Maximus celebrating the conquest of Judæa, and the Temple and Forum of Peace dedicated four years after the fall of Jerusalem, are the other memorials considered in this chapter.

The remainder of the book, dealing, as it does, with English and Scottish memorials, has to do with the mediæval period, for, with the exception of the remains of the Arch of Claudius, and some pearls and pigs of lead, there are no other memorials from Britain dating in the classical period. The tomb of the Saxon king Caedwalla, who died in Rome in 689, the Schola Saxonum (or Saxon quarter) dating from 727, the Hospice on the site of the barracks of the blue faction of charioteers, and the college built on the same site which entertained John Milton and Richard Crashaw, the residences of the English ambassadors of about the time of the Reformation, and finally the House of St. Gregory, from whose monastery St. Augustine started to preach the gospel in Britain, are the English memorials described.

The style of the author is most satisfactory in its clearness, and there is a marked absence of the obscure, professional form of statement. There is some evidence of carelessness, as when the Maffeian Fasti are classed as named from a place, whereas they are so designated in honor of the great scholar Maffei. The master of Varro was L. Aelius and not Lælius, and the letters in the Bibliotheca Pacis were those of Sinnius Capito and not of Asinnius Capito. Juvenal does not say that the Jews hung baskets on the trees. In the tenth century a mark by old English calculation equalled 100 pennies or denarii, and not 160, so that the families of Britain paying Peter's Pence numbered thirty, and not forty-eight, thousand. The illustrations are excellent and well chosen. Some have already appeared in the *Notizie degli Scavi*, particularly the aerial photographs, which, being distinct, are very useful.

RECENT POETRY.

The rapid increase of books of miscellaneous poetical selections, while valuable as supplying labor-saving machines, brings with it many disadvantages. The names of authors get misplaced; so do commas and semicolons. The copyist makes, unconsciously or consciously, slight alterations which the next transcriber multiplies, and it is only when some careful Dr. Rolfe comes along, after a century or so, that the original version is faithfully restored. One of the farther incidental evils is when a well-meaning editor, like Mr. John Burroughs, gives us 'Songs of Nature' (McClure), and intermingles through his citations English and American daisies, English and American corn, without so much as a hint that his poets describe different species. If the English language is to overspread the earth and to describe natural objects with equal

freedom from Alaska to Australia, we shall ultimately have to bring geography into even the books of poetical selections, or else hopelessly bewilder our children. Even apart from this, Mr. Burroughs's citations are not always accurate; thus, he quotes "Winter Night's Tale" for "Winter's Tale" (p. 27), gives us verses by Mrs. Darmsteter instead of Darmesteter (p. 32), and makes Shakspere's angels sing to the young-eyed "cherubims" instead of "cherubins." He also does some things of which the poets themselves might complain, as in citing the original form of Shelley's "Pine-Forest," instead of the later form; in taking parts of poems without indicating that they are only parts; in dividing the lines in his own way or running together lines which the poet separated, as in Browning's "Home-Thoughts, from Abroad" and the like.

With these limitations the volume has much that is varied and interesting, even in the preface of Mr. Burroughs, were it only for the quality best described as modest arrogance which makes him use the first person singular ten times in the first fourteen lines, and which leads him to venture again upon ground where he has more than once erred in time past, namely, in underrating the variations of nature, and assuming that nothing is true unless he has observed it within his own particular bailiwick. This he does, for instance, when he objects to Lowell for making the male oriole assist in nest-building (p. vii), although he is criticising an observer quite as careful as himself, and one who has once or twice, in times past, proved to be right when Mr. Burroughs was wrong. It may be remembered that the latter once censured Lowell roundly for making dandelions and buttercups bloom together, when it turned out that the critic had never even seen the particular species of buttercup which the poet was describing.

A collection of more permanent value is the series of "Colonial Prose and Poetry," edited by William P. Trent and Benjamin W. Wells (Crowell), contained in three volumes chronologically arranged and entitled respectively 'The Transplanting of Culture,' 'The Beginnings of Americanism,' 'The Growth of the National Spirit,' ranging in all from 1607 to 1775. The selection and distribution of these extracts could scarcely be improved; the combination of the Virginia and New England elements produces a work far more varied and readable than might have been expected; and we miss but few well-known and classic passages, one of these being the protest of the Rev. John Higginson against those settlers who count religion as ten only and the whole world as thirteen. A more serious question is that involved in the modernizing of the spelling, a question on which there will always be two sides, even in books for popular use. In some passages of these volumes, poetry and prose may be said to be combined, as in the description by the Rev. Benjamin Coleman of his friendship with "the incomparable Philomela," otherwise Mrs. Elizabeth Singer of Agford, near Frome, who had a volume of poems then in print, being then about her twenty-fourth year; and whom he found "comely in body, lowly in dress, with a soul fair and bright as an angel." This lady described to him the way in which she and her sister wrote poetry together:

"My sister," said she, "was a year or two younger than I, and her affection as well as wit was quicker. I seemed, however, to myself to think more thoroughly. She desired ever to be with me, and I wanted to be more by myself. We often retired by consent, each to her chamber, to compose and then to compare what we wrote. She always exceeded me in the number of lines, but mine, I think, were more correct" (vol. iii., p. 81).

It is quite difficult to believe that all this happened in a Puritan household in the seventeenth century, but so it was. Mr. Coleman did not, it seems, marry his Philomel, but he nevertheless had a daughter who was also a poet and who wrote verses which were, in the words of our editors, "pathetically impossible."

Another extremely interesting work of selections is 'Flowers from Persian Poets,' edited by Nathan Haskell Dole and Belle M. Walker (Crowell). We understand the extracts given in this work to have been selected by Miss Walker, and only the introduction to have been furnished by Mr. Dole. The work certainly gives an attractive and varied exhibition of the Persian poets hitherto scattered through a variety of volumes. It is beautifully printed.

Another book that may come under the head of collections is 'Walt Whitman's Poetry; A Study and a Selection,' by Edmond Holmes (Lane). The choice of Whitman's poems, some thirty or forty, is the best we have ever seen, and the criticisms are among the best. Mr. Holmes says of Whitman what others have observed, from the English point of view, that "his audience, though small, is select. . . . Popular he certainly is not, and is not likely to become" (p. 51). No one has better described what he calls Whitman's "recitative" manner, saying:

"At its best it is singularly impressive. There are certain inexpressible feelings—large, stormy, dreamy feelings that can never quite come to the birth—which it expresses (if I may be allowed the paradox) with marvellous power and effect. For this particular purpose it has no rival. Indeed, after reading some of Whitman's inspired passages, I feel for the moment as if all forms of metrical verse were by comparison cold, tame, and formal. But there is no other medium of expression in which the transition from poetry to prose is so rapidly or so easily made. Sometimes we find ourselves in the middle of plain, inoffensive prose without quite knowing how we got there" (p. 49).

Mr. Holmes says admirably, to counterbalance this: "One of the advantages of artistic form in poetry is that it makes for reserve and self-control. The poet has to keep back part of what he feels; and this intensifies the effect of what he says" (p. 9). He elsewhere says of Whitman: "He is the last man in the world to consume his own smoke."

Mr. Richard Watson Gilder's thin little volume of 'Poems and Inscriptions' (The Century Co.) inevitably makes the impression of some thinness within. The verses seem somewhat perfunctory, and suggest the possibility that, among his variety of active interests, the undoubted poetic gift of this author may have been somewhat arrested. The little Whitmanesque prose poem of "The Night Pasture" has a pleasing touch, but cannot be called an entire success; while "A Letter from the Farm" lacks a redeeming wit. The "Inscriptions for the Pan-American Exposition" are compact and well expressed, but are they quite worth putting into book form? Even Mr. Stedman's 'Mater Coronata' (Houghton, Mifflin & Co.), recited at the Yale Bi-centenary, is open in a degree to the same criticism. The very form of the ode has perhaps had its day, and it will be remembered that, of Lowell's three attempts in that direction, only one was really successful.

We have before now expressed our confidence in the poetic quality of Miss Josephine Preston Peabody as seen in her 'Wayfarers,' and still more in her 'Fortune and Men's Eyes,' when compared with the somewhat monotonous and tame volumes of verse which crowd the critic's table. They seem to show a difference of kind rather than of degree—an author evincing not merely talent, but genius. She has now had the farther daring to essay the drama, and there is certainly a continuance of promise. To take Marlowe himself bodily out of his own poems and set him elsewhere is surely no slight undertaking, and yet this is what she has done in her new volume, 'Marlowe' (Houghton, Mifflin & Co.). Its merit has been at once recognized by the critics, but what they do not seem to recognize is the profounder aspect of the book. They perceive the fresh grace of the lyrics interspersed, like this song (p. 124):

Summer-moon, Summer-moon,
  Bless thy golden face.
Come above the downs, now;
  Do the garden grace.
While we are thy care to keep,
Bless the field, bless the sheep;
  Shine on our sleep.

While the nightingales do sing,
  Come, bonny guest.
Thy foot-fall is a silver thing,
  West—west.
Morning goes and afternoon;
Summer will be going soon.
  Ay, Summer-moon!

The critics skim off the love-story from the surface, as if that were all, whereas the author herself skilfully assigns to it a subordinate place. The following lines tell us what the humble heroine was to Marlowe—an influence wholly sweet and good, so far as it went, but by no means potent enough to remould that world-weary life (p. 44):

Lodge.

And yet I could have sworn
Your eyes took interest in the little saint
We saw to-day.

Marlowe.

The little country shrine?
Why, so they did. And, therefore, she was made.
'T is only she will look with pitying gaze
On me in gorgeous torment. Snowflake pity,
Destined to melt and lose itself in fire,
Or ever it can cool my tongue! Ay, Tom,
I owe the Faith more tribute than I pay,
For its apt figures. Con thy Bible, Tom.
I'm glad they chanced here. I shall think, sometimes,
Just of her face: the little Quietude,
Standing in shelter, quite immovable,—
And reach my hand up for a tear, a drop
Of holy water from those hands of hers.
She fills the only need was left to me;
And sooth to say, I never thought of it
Before I saw her.

She, nevertheless, passes out of his life, while he faces his unfinished problem of existence, and dies. Here the young author shows the rare power of making her drama end at a climax, which she reaches in the final monosyllable of the play. This last touch is, indeed, so fine that only a great actor could do it justice; and in this respect, as in others, the reader longs to see it put upon the boards and tested behind the footlights, where so many mediocre things are just now finding their way.

Turning to new poetry of British origin, we find that Mr. John Lane, in most re-

spects an admirable publisher, becomes more and more tantalizing in the smallness of his books. Mrs. Alice Meynell's 'Later Poems' includes but thirty-seven pages. Nothing in this volume perhaps equals that "Letter from a Girl to her Own Old Age," which Ruskin called "perfectly heavenly," but the book is marked by that high-minded intensity which always belongs to its author, at least in verse—for her prose is more unequal. The following lines convey a vivid impression of an object which few Americans have perhaps noticed (p. 26):

NOVEMBER BLUE.

The colour of the electric lights has a strange effect in giving a complementary tint to the air in the early evening.—ESSAY ON LONDON.

O, heavenly colour! London town
Has blurred it from her skies;
And hooded in an earthly brown,
Unheaven'd the city lies.
No longer standard-like this hue
Above the broad road flies;
Nor does the narrow street the blue
Wear, slender pennon-wise.

But when the gold and silver lamps
Colour the London dew,
And, misted by the winter damps,
The shops shine bright anew—
Blue comes to earth, it walks the street,
It dyes the wide air through;
A mimic sky about their feet,
The throng go crowned with blue.

It is the misfortune of Mr. Henley to write during two-thirds of the time on the heights of heaven and love, and the other third in the depths of what he himself calls "the grizzly colonies of the grave." Hence his readers are alternately adoring and despairing. Take, for instance, this as the low-water mark in his 'Hawthorne and Lavender, with Other Verses' (Harpers) (p. lxiv):

Silence, loneliness, darkness—
These, and of these my fill,
While God in the rush of the Maytide
Without is working His will.

Without are the wind and the wall-flowers,
The leaves and the nests and the rain,
And in all of them God is making
His beautiful purpose plain.

But I wait in a horror of strangeness—
A tool on His workshop floor,
Worn to the butt, and banished
His hand forevermore.

Now turn to this (p. xliii):

A world of leafage murmurous and a-twinkle;
The green, delicious plenitude of June;
Love and laughter and song
The blue day long
Going to the same glad, golden tune—
The same glad tune!

Clouds on the dim, delighting skies a-sprinkle;
Poplars black in the wake of a setting moon;
Love and languor and sleep
And the star-sown deep
Going to the same good, golden tune—
The same good tune!

It is to be noticed, however, that, through all this wide range of variation, Mr. Henley's loyal love of wife and home and children remains a constant quantity, so that his books of poetry, at least, yield on the whole more of pleasure than of pain.

The same thing can hardly be said of Thomas Hardy, who, with increasing power of execution, shows an ever-growing tendency both toward the gloomy and toward the coarse, so that, even in his verses, he has to designate by simple dashes words not to be used in good society. It is impossible to regard this as a healthy or wholesome development. It is simply Whitman's "heroic nudity" and the violation of that reserve which higher natures feel. On the other hand, it accompanies at times a habit of vigorous expression which may reach some strong effects, if at too high a cost. If sheer strength is the only object, why was man created, and why were not the lion and the elephant enough? All this comes readily to the mind in reading Mr. Hardy's 'Poems of the Past and the Present' (Harpers). For mere thought and imagination, it is to be noticed that his poems of travel show a healthier tone than those written in England, and, perhaps, even a greater vigor of thought, especially those written at Rome and at Zermatt. We quote, for instance, stanzas written at the pyramid of Cestius, near the graves of Shelley and Keats, in 1887 (p. 53):

Who, then, was Cestius,
And what is he to me?—
Amid thick thoughts and memories multitudinous
One thought alone brings he.

I can recall no word
Of anything he did;
For me he is a man who died and was interred
To leave a pyramid

Whose purpose was exprest
Not with its first design,
Nor till, far down in Time, beside it found their rest
Two countrymen of mine.

Cestius in life, maybe,
Slew, breathed out threatening;
I know not. This I know: in death all silently
He does a kindlier thing,

In beckoning pilgrim feet
With marble finger high
To where, by shadowy wall and history-haunted street,
Those matchless singers lie. . . .

—Say, then, he lived and died
That stones which bear his name
Should mark, through Time, where two immortal Shades abide;
It is an ample fame.

There is at any rate a solid Saxon grapple of thought in all these poems by Mr. Hardy, even where the exercise of muscle is so robust and vigorous that one scarcely calls them poems. They are strangely contrasted in this respect with 'The Wind among the Reeds,' by W. B. Yeats (London: Mathews), to be classed with poems which, as some one has said, "seem little more than sighs that the silence should be broken." The same can hardly be said of 'Wagner's Nibelungen Ring done into English Verse' (Longmans) by Reginald Rankin, in which the touch is somewhat too heavy, so that the book is hard reading, and one rather wishes silence would return.

Historic Towns of the Western States. Edited by Lyman P. Powell. G. P. Putnam's Sons. Pp. xxxvi, 702. Illustrated.

Every man thinks his own geese swans, and every city thinks itself superior to its equals and equal to its superiors. It would have somewhat abated this delusion if the last official census of each town treated in 'Historic Towns' had stood at the head and front of its monograph as its "eternal blazon." These figures, largely lacking, have led to mystifications and tampering with comparative tests. Des Moines is declared to have "almost double the population of any other Iowa city," which double is 72,594. Its real census of 62,139 is suppressed. Omaha, silent as to her falling off more than 37,000 from a former census, hides her exact numbers and calls herself "the business centre of 175,000 people"; Cincinnati, with an unmentioned census of 325,902, reckons as "its belongings enough cities and villages across in Kentucky to swell her to the half-million mark." We are informed that "the population of Kansas City, in Missouri, is about 225,000." Had we been vouchsafed its census of 163,752, we should see that "about" excuses counting in more than 55,000 souls. It is added that "the region directly tributary is sure to press the city steadily forward till it ranks with Boston, Baltimore, and St. Louis." Chicago, deeming her 1,698,575 not worth printing, says she is "nearing the two million mark," and hints that predictions of "ten millions ultimately harbored there would not be wildly optimistic." Spokane claims to have grown within thirty years from three persons to fifty thousand; but its actual count of 36,848 nowhere appears. In Salt Lake City the official numbers 53,531 are given, but are also impeached in the same sentence by these words: "though the current city directory, compiled immediately after the census enumeration, gives names and addresses of nearly seventy thousand resident inhabitants." Here and elsewhere "almost" and "very nigh" save many a lie.

The beadroll of vague exaggerations, preferring the doubtful to the certain, is too long to go through. It betrays a scorn of accuracy which is vexatious even to those it cannot mislead, and forebodes further carelessness which is not wanting. The motto of the leading monograph, borrowed from Senator Daniel of Virginia, prints his name "Daniels." Carver's three years' travel is declared to have begun in 1776, yet "the Revolution came afterward." It is stated that Lewis and Clark went to the Columbia in 1803, and that Pike started up the Mississippi in 1804. River Raisin is printed River Basin. "Ad majoram gloriam" also appears. Misprints are too many to be accidental. The first page fixes the founding of Marietta "on the seventh of April, 1788," and its founding is elsewhere mentioned to have been "two months before that of Cincinnati," which is chronicled as two days after Christmas, the same year—a short year when two months stretched from spring to midwinter. Again, in regard to the Indian capture of Mackinac, we are told that "more than two thousand of the English lost their lives" (p. 338). But no historian sets down the total then slain as more than seventy soldiers and a trader or two. Three-score and ten was really an absurd overestimate—originating, perhaps, from the verbal similarity of seventeen and seventy. The official report of the British captain was: "The Indians killed one lieutenant and fifteen rank and file." These dwindling numbers bring to mind the eleven thousand virgins, all martyred with St. Ursula, whose bones some of us wept over in Cologne till we learned that the victims had been multiplied by a verbal misunderstanding; the name of a single maiden Undecimilla (Miss Eleventhousand), when written without an initial capital, being taken for a numeral.

The contributions to this picnic are unequal in everything except in length. One of the best is that on Madison, Wisconsin. Its points are well chosen, dwelt on in due proportion, with none of that boomer effusiveness which is elsewhere such a besetting sin. Critics, however, will cavil at calling pamphlets books, and, while not showing the census of 19,164, talking of Madison as "a community of 25,000"—thus effacing the line between urban and suburban limits.

The preëminences arrogated to several cities are in things doubtful or trivial. Cincinnati rejoices that she stands "nearest the centre of national population," as "always a strategic point," and as the "largest centre of playing-card manufacture." Detroit, pointing with pride to her

"sunsets as unrivalled," provokes Shaksporians to ask: "Has Britain all the sun that shines?" She notes that more tonnage passes by her than enters and leaves London and Liverpool. Every Channel town may say as much. Cleveland shows a portrait of Artemus Ward, because he sojourned there two years. Like a circle in the water, she never ceases to enlarge herself; says that half our millions cluster round her within 700 miles, and that "Garfield, Hayes, and McKinley may be considered citizens of greater Cleveland"—whatever that may be. Her chapter is headed "The Pleasant City." Redolent of the Standard Oil Company, her favorite child, and aspiring to be more sooty and smoky than Pittsburgh, she persists in the iteration and reiteration, from first to last, of "so pleasant."

We have exposed certain peccadilloes in the book under review, not because it is bad, but because it is so good. It supplies a desideratum, and its faults are of easy correction. Type, paper, illustrations, and general make-up are not far from immaculate. The introduction binds up, so far as may be, the scattered ears into a sheaf. It is a scholarly exhibit of the natural causes, in mines, soil, rivers, lakes, as well as the moral, political, economic causes, of settlement and expansion. Its weakest monographs teach us much we are glad to know and cannot find elsewhere. Its nonsense is suited to popular nonsense, and will heighten its popularity. Its sphere will be wider than its own West, and it will win many to Westernize.

Two Centuries of Christian Activity at Yale. Edited by James B. Reynolds, Samuel H. Fisher, Henry B. Wright, Committee of Publication. G. P. Putnam's Sons. 1901.

It was to be expected that a volume of this kind would be one of the monuments distinguishing Yale's bicentennial celebration. It was also to be expected that it would be a better book than the one actually in hand. Its main defect, which is more particularly characteristic of the first six chapters (all, together with the thirteenth, by one writer, H. B. Wright), is that the religious life of the college and university is regarded almost exclusively as a matter of successive religious revivals, as if these were not largely responsible for the periods of moral and spiritual indifference that intervened between the spasmodic ebullitions. Much ado is made about the influence of French infidelity as causing the condition which followed hard upon our Revolutionary war. But this condition was more obviously the result of a reaction from the excitement of the Great Awakening and the subsequent eruptions of Whitefield's fiery zeal.

The most interesting episode of the first chapter is that of the Rev. Timothy Cutler's secession to the Episcopal Church, with the sole tutor who, with him, then President or Rector, constituted the entire faculty. This was in 1722, soon after the removal of the college from Milford and Saybrook, where the students had been scattered abroad, to New Haven. President Cutler's first innovation consisted in saying, "And let all the people say, Amen," at the end of his commencement prayer. Dr. Woolsey wrote in 1850, "I suppose that greater alarm would scarcely be awakened now if the Theological Faculty of the college were to declare for the Church of Rome, avow their belief in transubstantiation, and pray to the Virgin Mary." The offenders were sharply cut off, and a hedge was built about the lawn to keep off all sheep which had not the Congregational mark, and that clearly defined. The next President, Elisha Williams, had been "sanctified by a severe fit of illness in 1720." This method of sanctification seems to have had great efficacy at that time, and further on. "It pleased God," says Jonathan Edwards, "to seize me with a pleurisy, in which he brought me well nigh to the grave, and shook me over the pit of Hell." His conversion immediately ensued. An epidemic of smallpox, in 1721, and of diphtheria, in 1735, and an earthquake, in 1727, are associated with Jonathan Edwards's local revival in 1734, as proximate causes of the Great Awakening of 1741.

A second chapter has for its subject that awakening and its effects. The view is wholly sympathetic. There is no suggestion of the arrogance of Whitefield's spiritual manners, nor of the excesses which filled the mind of Jonathan Edwards with profound anxiety, mixed with some distrust. Thomas Clap, then President of Yale, was at first extremely hostile to Whitefield, and there were expulsions of Brainerd and others from the college for adherence to the New Lights. It was certainly unkind of Brainerd to say that Tutor Whittlesey had no more grace than a chair when he had prayed an hour continuously in his best manner. President Clap had softened so much in 1754 that, when Whitefield called on him, he "treated him much like a gentleman," and later he became distinctly favorable to him. Nevertheless, until the Timothy Dwight revival of 1802, the decline of religious interest was strongly marked.

Mr. Wright seems not to know of any shades of belief between a high orthodoxy and "infidelity." A violent attempt is made to show that there were special reasons why only one student was present at a communion service in 1799 or 1800; but in comparison with the labor, the effect is small. An invidious comparison is made between an evangelized Yale in the first decades of the last century and Harvard, where the Unitarian movement prospered, having for its creed "Salvation must be obtained by culture"—an unaccredited quotation behind which Mr. Wright betakes himself for a division of responsibility. President Stiles is handled softly, considering the extent of his aberration from the stricter orthodoxy of his time and his friendly relations with Benjamin Franklin. It would not have been amiss, in speaking of the revival of 1831 and Bushnell's part in it, to have mentioned his 'Christian Nurture' as the most pungent criticism on revivalistic methods that they have received *ab intra*, as it were. A little further on we read, "William Lloyd Garrison's frenzied attack on the Church in 1837 was not without its effect. At Yale the firemen's riots and the killing of Tutor Dwight give evidence of a disturbing element in the early forties." Here the *post hoc* seems to be meant to suggest a *propter hoc*, but the conjunction may be accidental. One of the best chapters is that of the Rev. Timothy Dwight, "The College Pastorate." The Young Men's Christian Association also has a chapter, which it richly deserves in support of the opinion expressed in the introduction that all other agencies have done less for the Christian temper of the college as it is to-day than that association.

The Life of Lord Russell of Killowen. By R. Barry O'Brien of the Middle Temple, Barrister at Law. Longmans, Green & Co. 1901. Pp. 405.

This bright, sketchy piece of work is likely to interest lawyers most of all. The author, an old friend and a great admirer of the late Chief Justice, tells the story of a remarkable career in a style calculated to entertain the reader, if it does not greatly instruct him. He accords to Russell the possession of extraordinary powers, but is content to state the fact rather than to illustrate it by examples.

Lord Russell died suddenly in August, 1900, at the age of sixty-eight, completely worn out by work kept up continuously at high pressure. He sat upon the bench for a period too brief to discover whether his fame as a consummate cross-examiner and a great winner of verdicts was to be surpassed by his accomplishments as a judge. That Sir Charles Russell was a wonderfully successful lawyer is universally conceded. Of Irish birth and a stanch Catholic, Russell stood up for Ireland wherever he had opportunity. Starting as a solicitor at Belfast, in 1854, he determined, alone and friendless, to try his fortune in London. He was called to the English bar in 1859. Intensely devoted to his profession, he by rapid strides advanced to be a leader on the Northern Circuit. He "took silk" in 1872. He appeared in great causes. Of course, he entered Parliament, and as a Liberal evinced conspicuous ability in one or two speeches; but he reserved his strength for contests at the bar. The steady growth in distinction that rewarded Sir Charles Russell's industry made his name well known in America. His masterly exposure of Pigott before the Parnell Commission earned for him unstinted praise. He was of counsel in the Bering Sea arbitration, and later, when Chief Justice, he sat as an arbitrator in the Venezuela affair. By advice of Gladstone he became Attorney-General, in 1886. Entering the House of Lords in May, 1894, he was almost immediately afterward, upon the death of Lord Coleridge, made Lord Chief Justice of England. In 1896 Lord Russell visited the United States for a second time, and delivered at Saratoga the annual address before the American Bar Association, which added to his already high reputation here.

Material for a successful biography is not usually rich in the case of a great lawyer or of a great judge. The life of such a man lacks stirring events. A clever writer, however, can make an interesting presentation if he has a clear insight into the character of his subject, together with the art of pleasing delineation. Mr. Barry O'Brien is in entire sympathy with his task, but the art in question he is not master of. We gather that Sir Charles was a man of imposing personal appearance. Our author expresses the fact in such form as this: "In truth he was more than a great orator; he was a great personality" (p. 95). "He was always big; that was his great characteristic" (p. 97). "In addressing the jury, as in cross-exam-

ining the witnesses, it was Russell's personality that really told" (p. 102). "On the turf, as everywhere, his personality was felt" (p. 348). In a like abrupt manner we are told of a certain prejudice that Sir Charles displayed: "Russell hated fur coats as much as he hated pretence and pomposity" (p. 107); "Russell could not bear Astrachan coats" (p. 190). The following burst of admiration, we are free to say, exceeds anything to be found in Lord Campbell's Lives. It appears in a tribute from a barrister: "'Ordinarily,' says a shrewd observer, 'the judge dominates the jury, the counsel, the public—he is the central figure of the piece. But when Russell is there the judge isn't in it. Russell dominates every one'" (p. 103).

As the reader may surmise from the tone of these extracts, there is a lack of dignity in the author's treatment of the subject. For this shortcoming Russell has to suffer. Mr. O'Brien does not touch the springs of our affection in behalf of his friend, but whether the defect lie in the subject or in the biographer himself it may not be worth our while further to inquire.

Because of a certain freedom of treatment and a liberal sprinkling of anecdote the book is rather agreeable reading, but it is not of much value viewed as literature. The keenest estimates of Russell are contributed by others. Hoey remarks: "Russell does not leave many corners of your mind unsearched" (p. 224); while Mr. Jelf, in a very interesting article, says of him: "His chief fault was a kind of intolerance of stupidity, prolixity, or inaccuracy, which led him at times unconsciously to do injustice both to counsel and witnesses. He seemed unable to make allowance for the inferior mental capacity of those with whom he had to deal" (p. 329).

The Roman Theocracy and the Republic: 1846-1849. By R. M. Johnston. Macmillan Co. 1901.

Mr. R. M. Johnston, a young American scholar educated and living in Europe, has written a very readable book on the Italian situation during the first three years of the pontificate of Pius IX. As the title suggests, the chief interest centres around the conflict between the theocratic and the democratic elements in Rome itself; but, in order to make this clear, the author gives us in outline the history of the exceedingly complicated negotiations and the widely divergent interests that were, in their way, both causes and consequences of the central struggle. The policy of the man Pius, the interests of the young democracy of France, the ardent strivings of the apostles of Italian liberty at any cost, the reactionary forces of Austria and Naples, the ambitions of Savoy, the furious passions of the secret societies, Jesuit, Carbonari, Sanfedists, and all the rest—these form the material out of which the historian has to weave his narrative. To give a place to them all without a wearisome mass of detail, to show their interworking without confusion, is a problem which Mr. Johnston has solved with unusual success. He has had access to good sources, and has used them with an evident desire to be fair. It is not easy to determine at the close whether he is Catholic or Protestant, so clearly does he sympathize with whatever is sincere and forward-looking on either side. Yet it would not be true to say that his presentation is colorless. The portrayal of Pius IX., for instance, is plainly touched with great feeling for the good intention with which this Pope began, and for the immense difficulties he had to meet. It is only another contribution to the mass of evidence that the functions of a theocratic ruler and the head of a democratic state are simply irreconcilable. The excellent pope must necessarily prove a thoroughly useless ruler.

Equally fair is the judgment of Mazzini, which appears in Mr. Johnston's references to his part in the Roman conflict. A hopeless idealist, seeing but one great object and regarding all others as mere contributors to this, Mazzini was inevitably out of his place in the midst of the Roman crisis. Yet, as the story of this Roman episode progresses, one is led to feel that it was, after all, only an episode in the larger conflict out of which a united Italy, heir to all the problems and all the weaknesses of her pathetic past, was to arise.

Mr. Johnston's volume is enriched by a bibliography of some twenty-five pages, and several useful documentary illustrations.

The True History of Captain John Smith. By Katherine Pearson Woods. Doubleday, Page & Co. 1901.

The life and adventures of the redoubtable Captain John Smith have of late years been the subject of somewhat fierce contention, which, oddly enough, turns less upon the important things which he unquestionably did, than upon those which it is of no consequence whether he ever did or not. It is really of very little matter whether he was ever thrown overboard in a storm at sea and swam to shore; whether he was or was not a slave in "Cambia" and escaped by knocking out his master's brains; or whether he decapitated three Turks with one sword, or one Turk with three swords. It is true that "the lady Charatza Tragabigzanda," who cast upon her captive an eye of favor, suggests a number of old romances, as her name suggests that of "the Princess Micomicona"; but such things have happened before; and as for her name, latter-day Greek spelt by Smith according to the light of nature might account for more than this. These matters do not affect the course of history, which is here concerned only with the undisputed fact that, whatever his perils and sufferings were, he survived them and lived to plant the colony of Virginia.

The historical part of Smith's career is told by Miss Woods in a sprightly and agreeable way, which brings Smith very clearly before us. Few men have had more difficulties to contend with, and few have contended with them more valiantly. That he had a genius for colonization and exploration, the veriest skeptic cannot deny; but to the present writer his map of the Chesapeake Bay and its shores is a greater marvel than the decollation of any number of Turks.

The book is handsomely illustrated. The old maps of Southern Russia are interesting, and, we believe, are reproduced here for the first time. That of part of Transylvania (promised in the preface) does not appear. The "Rolfe" portrait of Pocahontas is, no doubt, genuine; but as for the "Sully" portrait, credulity itself must reject it. Apart from the utter incompatibility of the features, no such dress could have been worn in the first quarter of the seventeenth century either in London or at Werowocomico. The blazon of Smith's coat-of-arms is taken from Arber; but it contradicts not only the rules of heraldry, but the description in the text. Thus, in the first quarter, instead of "vert, a chevron gules," we have here argent, a chevron party per pale, or and azure. In the second quarter, for a field azure, we have a field argent; and in the third instead of argent, a bend azure, we have or, a bend engrailed argent!

History of Intellectual Development on the Lines of Modern Evolution. By John Beattie Crozier. Vol. III. Longmans, Green & Co. 1901.

When we bade a hopeful *revoir* to Mr. Crozier's History at the end of its first volume, Christianity was just thoroughly established; but, the second-projected volume having been skipped, we are now surprised with a third, devoted, half to the nineteenth century and half to the twentieth. We are very sorry that failing eyesight was the cause of this change of plan, as we suppose it also was of there being no history, but only disquisition, in the third volume. But we are heartily glad to meet Mr. Crozier again on any terms, for he always has something to say which were well worth reading, even if it were not set forth in a style which would make almost any matter pleasurable—a style which this iron age is not all accustomed to. What he now gives is the application of what we should have learned in the second volume to the politics of England, France, and America of to-day. He lays down four "rules of practical statesmanship" as the lessons which we should have learned from the unwritten volume, and then proceeds to apply them modestly, as mere exemplifications of their meanings, to the condition of the three countries named. The rules are as follows: First, consider the genius of your nation. Don't try to make a lap-dog of a horse; but limit yourself to such excellences as your stock can vitally assimilate. Second, make for the ideal in a steady march; but do not leap to it. Third, break down any barriers which may prevent one caste from being recruited from another. Fourth, restrict your aim to improving the material and social condition of your country; and do not attempt to change the character of your people.

When he comes to deal with the United States, Mr. Crozier finds the government so perfect that no room is left for other than minor suggestions:

"For," says he, "if we consider it, there is no one of the great objects for which government exists that has not for the last hundred years been abundantly provided for and safeguarded by the Federal Constitution—life, liberty, the pursuit of happiness, security of person and property, freedom of religious opinion and worship, and, above all, an open arena, with equal rights, equal opportunities, and equal access to positions of honor and trust for all—and that, too, in a degree unknown elsewhere in the world, with the exception, perhaps, of certain colonies still attached to the British crown."

Of course, it is our duty to be amused

at every remark that a foreigner may make upon our politics; and we are a little amused at Mr. Crozier's imagining that the Federal Senate is much freer from evil influences than the House. The best of his hints is, that a great part of the business of House committees, being of the nature of inquiry into facts, ought to be conducted somewhat according to the rules of a court, evidence being heard in public. He also suggests that private bills and other exceptional legislation ought to be discussed in a large and public committee before going to the special committee.

Mr. Crozier is very much opposed to abstractions in politics (such as equality and the like) being considered as ends. He is willing to grant that they may be commendable means. But an end, in his view, must be something strictly concrete and free from all generalization—at least in politics. Some will think that that opinion affords an accurate gauge of Mr. Crozier's philosophical calibre. Anybody whom his former books reminded of 'Typical Developments' will be capable of smiling at parts of this; but it must be acknowledged that it abounds in suggestions, as we have said, and the ornate and almost poetical style would render far less solid matter agreeable reading.

The Meaning of the Good: A Dialogue. By G. Lowes Dickinson, Fellow of King's College, Cambridge. Glasgow: James MacLehose & Sons. 1901.

With certain notable exceptions, the deeply thoughtful philosophical books have not been popular. The philosopher ordinarily claims the scholar's exemption from solicitude for the unscholarly public. Since the common man is not under the necessity of being a biologist, or a philologian, or an archæologist, the mutual reserve of the scholar and the public is congenial to each. But the case of the philosopher is anomalous, because everybody must be a philosopher. There are good and bad archæologists, and men that are not archæologists at all; but all men are either good or bad philosophers. Hence, if the scholarly philosopher keeps himself from the people, they must turn to the nearest prophet, and he is very likely to be a quack. Contemporary writers, such as Caird, Paulsen, Royce, and James, have taken pains to offer their best thought in such form as makes it accessible to the general reading public; but the majority acknowledge no such duty. Mr. Lowes Dickinson has made a distinct contribution to popular philosophy, in that he has succeeded in expressing himself in the language of literature without ceasing to be a philosopher.

This book raises the central problems of ethics in the course of a very frank and untechnical discussion carried on by a group of men representing widely different occupations and interests. The ethical theories scholastically denominated as Hedonism, Intuitionism, Rationalism, and Idealism appear in this fictitious dialogue as the expression of different aspects of the common man's moral experience. The discussion is given a certain unity by the progressive effort to define the Ultimate Good, or that which lends value to life and is fit to be the highest object of endeavor. But it is finally concluded that there are many good things which are good because human experience finds them to be so, though they are capable of comparison in respect of such considerations as their permanence or their intrinsicality. Experience, being "a progressive discovery of the Good," finds in the highest forms of love the nearest approach to that final ideal.

The account is not altogether satisfactory in its outcome, because, though it admits the impossibility of naming a concrete good that shall be universal and ultimate; it does not provide for the formal definition of the Good in terms of self-realization. But, taken as a whole, the book is both inviting in its style and stimulating in its thoughtfulness.

THE LATEST ON NICARAGUA

OCEAN TO OCEAN

By LIEUTENANT J. W. G. WALKER, U. S. N. *Ready in February*

A charming account, personal and historical, of Nicaragua and its people, by the son of Rear Admiral Walker, the head of the Nicaragua Commission. Lieutenant Walker conducted the survey of 1898, and gives his impressions of the country from the standpoint of the observant traveller. It is equally interesting to the admirer of entertaining travel notes, and to the reader who wants the latest information on a vital topic of the hour. The full text of the Clayton-Bulwer and Hay-Pauncefote treaties is included in the volume, also a graphic account of the Walker Filibustering Expedition,

With 15 full-page plates and 4 maps. 12mo, indexed, $1.25 net.

ALSO, NEW EDITION

NOTES ON THE NICARAGUAN CANAL

By HENRY I. SHELDON *Ready in February*

A brief for the Nicaragua route, written by a business man, who states clearly and forcibly the reasons for his choice All the great canal projects of the world are considered in connection with the discussion of the present enterprise, and a complete index is also included. The book has been a strong factor in the literature of the subject, and a new edition has become necessary. It is uniform in style with "Ocean to Ocean," and each book supplements the other admirably. Together they are the latest word on a question of National interest.

With 22 full-page illustrations and 5 maps, 12mo, indexed, $1 25.

GINN & COMPANY, Publishers
Boston, New York, Chicago, London.

Back Numbers of "The Nation."

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but will bring very little in proportion if a single number is missing. Volumes II. and III. are also scarce, but not so high-priced as the first.

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to Mr. J. W. Christopher, 47 Dey St., or Mr. A. S. Clark, 174 Fulton St., New York.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half year. Two volumes per year have since been issued, Vol. LXXIII. comprising the last half year of 1901.]

For Sale To-day Everywhere

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has the largest circulation of any literary and political journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

The MACMILLAN COMPANY

HAS JUST PUBLISHED

The CARE of DESTITUTE, NEGLECTED AND DELINQUENT CHILDREN

By HOMER FOLKS, *Superintendent of the Children's Aid Society of Pennsylvania, 1890-1893; Secretary of the State Charities Aid Association of New York, 1893-1902; General Secretary of the National Conference of Charities and Correction, 1901-1902; Commissioner of Public Charities of the City of New York, 1902.*

Cloth, 16mo, **$1.00** *net.*
(Postage, 10 cents.)

The first volume to appear in a new series of works on "American Philanthropy of the Nineteenth Century." The book covers succinctly the solution of private and public institutions for children, of placing-out in families, temporary homes, protection of neglected children, and the education of delinquents, with a chapter on present tendencies in "child-saving" work.

EXPERIMENTAL SOCIOLOGY

Descriptive and Analytical: Delinquents

By FRANCES A. KELLOR, *Graduate Student in the University of Chicago.*

Cloth, Crown 8vo, **$2.00** *net.*
(Postage, 15 cents.)

A book which presents a new method in sociological study and new data as to whites and blacks not only as to criminality, but as to social conditions. Constructive work of value to sociologists and educational theory.

THE THEORY OF PROSPERITY

By SIMON N. PATTEN, Ph.D., *Professor of Political Economy in the University of Pennsylvania, author of "The Development of English Thought."*

Cloth, **$1.25** *net.* (Postage, 11 cents.)

This work unites the discussion of economic theory and evolutionary doctrines as they never have been focused before; a practical book in the best sense.

THE COLLEGE STUDENT and his PROBLEMS

By JAMES H. CANFIELD, LL.D., *Librarian of Columbia University.*

Cloth, 16mo, **$1.00** *net.* (Postage, 8 cents.)

Helpful, witty advice drawn from a long experience as Secretary and President of the National Educational Association, Professor of History, University of Kansas, Chancellor of the University of Nebraska, President of the Ohio State University, and at Columbia University. Short, admirably written, sound, and wise, it is pertinent to most interests of student life.

THE SECOND GENERATION

By JAMES WEBER LINN.

Cloth, **$1.50**

The story of an old hate bequeathed by father to son; of how the latter is by it forced into a course against his nature and his hopes of happiness; a vivid story of newspaper life in Chicago. Frankly a novel whose chief interest is romantic, but drawn from active every-day life.

Books published at NET prices are sold by booksellers everywhere at the advertised NET prices. When delivered from the publishers, carriage, either postage or expressage, is an extra charge.

66 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, JANUARY 30, 1902.

The Week.

It is President Schurman who is now guilty of inflaming the Filipino mind by his recent insistence that the only honorable course for this country is to give independence to the islanders. Hitherto it has been Mr. Bryan, or Mr. Hoar, or the Boston Anti-Imperialists, or the independent newspapers who did such deadly work by standing up for the rights of the Filipinos. But now Mr. Schurman, President of the first Philippine Commission, and versed in Philippine affairs, is really undoing all the splendid service of the troops and inciting the natives to fresh resistance by his doctrine, enunciated last week in Boston, that, if we went to war for any other than an altruistic purpose, we laid ourselves open to the charge of manslaughter. Gen. Wheaton, the acting commander in the islands, is reported to have said that in the Philippines men have been sent to prison for such remarks as those of President Schurman. The latter does well to retort:

> "If that be true, it is the saddest and most discouraging truth that has come to us for a long time from the Philippines. Without freedom of speech, civil government will never win the support of the Filipinos."

The question cannot be settled even temporarily by choking and smothering. Experience has abundantly shown that no government has ever yet been wise enough to pick the doctrine, or set of doctrines, that can safely be suppressed. Attempted suppression will only make opposition the fiercer. If this counsel for independence "be of men, it will come to naught; but if it be of God, ye cannot overthrow it, lest haply ye be found even to fight against God."

The New York *Sun* considers President Schurman to have misinterpreted the language employed in President Roosevelt's message, which, it says, was *not* "a declaration in favor of scuttle at any future time, a prediction of the lowering of the American flag by and by, or of the abandonment of the sovereignty acquired by the treaty of Paris." We agree that the President's language might have been more explicit, yet we cannot see that Mr. Schurman enlarged its meaning or put an unwarranted construction upon it. What is the "great burden" that we are to be relieved of when the natives show the power of governing themselves? It must be the burden of governing the islands. The President could not have had in his mind the burden of killing the inhabitants, burning their villages, destroying their food, and subjecting to torture those who refuse to give up their guns. That is indeed a great and sorrowful burden, but it is not the one the President had in mind. Is there any other meaning to be put upon his words? The only alternative is to suppose that he meant to express the hope that the time would come when we might stand in the same relation to the Philippines in which Great Britain stands in reference to Canada. But if he had meant that, he would have said so. Canada adheres to Great Britain not by compulsion, but by choice. If the Filipinos were attached to us in that way, nobody would speak of them as a burden, to be relieved of as soon as possible.

Announcement was made on Friday that the treaty by which Denmark cedes her West India islands to the United States had been signed at last. As the *Tribune's* dispatch puts it: "This consummation of protracted negotiations, which will put the United States in possession of the strategic key of the Caribbean, and relieve Denmark of a steady drain on her resources, came unexpectedly after the hope had almost been abandoned." But it appears from the same dispatch that several steps are to be taken before the "consummation" is fully consummated. There are still wanting, on this side of the water, ratification by the Senate, and an appropriation of $4,500,000 by the House; on the other side, ratification by the Danish Rigsdag; and, midway, the assent of a majority of the people of the islands, by popular vote. Whether all the people are to vote, or only the whites, is not stated. This is a matter of some importance, since they are mostly blacks and mulattoes. Thirty-five years ago the saddling of these islands upon the United States was as nearly consummated as it is now, but the Senate declined at that time to "relieve Denmark of a steady drain on her resources" by assuming the burden ourselves. Shortly after the Seward-Rassloff treaty was rejected, the island of St. Thomas was so terribly shaken by an earthquake that the harbor was practically abandoned as a commercial entrepôt, and the shipping which formerly centred there took refuge at Barbados.

It is a serious question which the Senate now has to pass upon. Shall we acquire another group of islands, to be either neglected or treated in the same way that we treat the inhabitants of the Philippines, Porto Rico, and Cuba? The latter is, to all intents and purposes, one of our possessions, and may therefore serve as a kind of beacon-light to show us what we should avoid. The leading question of our national policy to-day is whether we shall allow Cuban sugar to be imported at lower rates of duty than those of the Dingley tariff. The whole question is agitated by that question. Next to it in importance is the question, What shall be the rates of duty on the sugar and other products of the Philippines? If we acquire the Danish Islands, the question will be, What rates of duty shall we impose upon the sugar of Santa Cruz? The other islands, it should be remarked, have no products, or none to be exported to the United States. Ultimately, we may assume that the products of all islands belonging to us will be admitted free of duty. This is what the sugar-planters of Santa Cruz count upon. This is what our beet-sugar men will have to reckon upon. But that is not all. This is the first step toward other West Indian annexations. The same reasons which prompt us to take the Danish possessions apply to any and all others, of the burden of which any European Power wishes to be relieved. The islands are desperately poor. Those for which we are now asked to give $4,500,000 of good money would not be accepted as a free gift if the Senators who have to vote upon the treaty should visit them in person. They will simply bring us new responsibilities and new expenses. Every argument that caused the rejection of the Seward treaty in 1867 remains in full force to-day, while the one argument in favor of it—that we were without any naval station in those waters—has ceased to have force since we have acquired Porto Rico.

Evidence is accumulating that something will be done speedily by Congress for the relief of Cuba, by a reduction of the duties on sugar grown on that island. The greatest apparent obstacle to such a step hitherto has been the supposed need of making an equal reduction to all countries with which we have treaty relations embracing the "most favored nation" clause. Investigations of the subject made by high authorities lead to the conclusion that the "most favored nation" clause does not apply to a country bearing the relations to us that Cuba bears at the present time. Mr. Frank D. Pavey has prepared a brief in behalf of the Chamber of Commerce of the island of Cuba, in which he maintains that, "during the military occupation of Cuba by the United States, Cuban products have the same international status as American products." At first sight this proposition strikes the reader as a surprise, but it has the support of Chief Justice Marshall and of the English Admiralty Courts. In the case decided by Marshall,

a ship carrying sugar, grown on the Danish island of Santa Cruz, and owned by a Danish subject, was captured during the war of 1812 by an American privateer and brought into an American port as a prize of war, on the ground that Santa Cruz had been captured, and was then actually held, by Great Britain. The court held that the sugar was lawful prize, saying that, "although acquisitions made during war are not considered permanent until confirmed by treaty, yet to every commercial and belligerent purpose they are considered part of the domain of the conqueror, so long as he retains the possession and government of them. The island of Santa Cruz, after its capitulation, remained a British island until it was restored to Denmark."

An opinion of Prof. J. B. Moore of Columbia University runs the same way. As quoted in the morning press, he says that when the reciprocity treaty between the United States and Hawaii was concluded in 1875, Germany acknowledged in a treaty that the "most favored nation" clause could not be invoked to secure the admission by us of German sugar free, since "the relations of proximity and other considerations" were not the same. The conditions which operated in the case of Hawaii, Professor Moore contends, "exist in the case of Cuba with a force and completeness not to be found in any other country not under the titular sovereignty of the United States." His general conclusion is, that the "most favored nation" clause does not stand in the way of the mutual reduction of duties on trade with Cuba. There is, perhaps, no higher authority in this country than the gentleman who gives this opinion.

The hearings before the Committee on Ways and Means on the Cuban sugar question were enlivened on January 22 by a colloquy between Mr. Richardson and Gen. Grosvenor. In the course of a statement made by Mr. Oxnard, the representative of the beet-sugar interests, the latter referred to Mr. H. O. Havemeyer and the Sugar Trust as the parties behind the movement for a reduction of the duties on Cuban sugar. Mr. Richardson asked whether he meant to say that President Roosevelt had been moved by the Sugar Trust to recommend such reduction. That Mr. Richardson's arrow went to the mark was proved by the start which it gave to Gen. Grosvenor, who "denounced such proceedings," and made the point of order that Mr. Richardson was trying to lead the witness (Oxnard) to attack the President of the United States. Mr. Richardson calmly replied that he had no such intention, and that he was seeking the truth. Then Mr. Oxnard disclaimed any intention to reflect upon the President. So the net purport of his statement was that the Sugar Trust had "put up the job" of reciprocity with Cuba, but that the President of the United States, from whom the movement derived its principal force and impetus, was as innocent as a lamb. The result of this tilt in the Committee was very damaging to the opponents of the measure for the relief of Cuba.

Another heavy blow was struck by ex-President Cleveland in a letter to Mr. A. B. Farquhar of York, Pa. Mr. Farquhar had asked him for an expression of his views on the subject of Cuban reciprocity. The latter replied that he considered the arguments of the beet-sugar men in opposition to the petition of the Cubans fallacious, mistaken, and misleading, but that the question "involves considerations of morality and conscience higher and more commanding than all others"; adding,

> "The obligations arising from these considerations cannot be better or more forcibly defined than was done by President Roosevelt in his message to Congress, nor better emphasized than has been done by Secretary Root; and yet Congress waits, while we occasionally hear of concessions which rich sugar interests might approve in behalf of trembling Cuba. I do not believe that nations, any more than individuals, can safely violate the rules of honesty and fair dealing."

We hold strongly to the belief that, if President Roosevelt shall, in this case, emulate the firmness and persistence with which Mr. Cleveland, in 1893, pushed the bill to repeal the Sherman Act, the measure for Cuban reciprocity which he and Secretary Root have so admirably presented to Congress will be passed in time to afford the needed relief.

Unfortunate Mr. Hepburn held back his speech of January 9 on the Nicaragua Canal Bill from the *Congressional Record* for ten days; but if he hoped to revise it into a less ridiculous conflict with the facts subsequently developed, he found the task impossible. He could not take back his high praise of the Canal Commission. There was Admiral Walker at the head of it, a man "most admirably fitted by his reading, his experience, his industry, his fidelity to duty." The report of the Commission was "well considered," and was in favor of the Nicaragua route. For what more did the House wish to wait? "We have their report"; let not the House be further beguiled about the possibilities of Panama. But, alas, before this appeal got into type, "we have their report" unanimously in favor of Panama; "admirably fitted" Admiral Walker, with his known fidelity to duty, signing with the rest. Any one but Hepburn so caught would look foolish; so would any House caught voting under his dictation. But the intrepid Congressman coolly announces that while facts may alter, his opinion based on them will remain the same, and that there is nothing in the revised report of the Commission to "lead to any abandonment of efforts in behalf of the Nicaragua route."

Rumors that there will be no canal legislation at all during this session of Congress have at least this foundation in fact, that exorbitant demands by Colombia or Nicaragua and Costa Rica may so disgust and chill Congress that it will vote no money at all for the present. The truth seems to be that the Central American countries concerned think they see a glittering prize all ready for their seizing. They have their eyes upon the surplus in our Treasury, and are simply figuring out how much of it they may get, to place it where they know it will do the most good. We understand that even the apparent check to their hopes has not made the Nicaraguan authorities a whit less exigent in their financial demands. If Colombia, as is reported, thinks that this country is now bound to take the Panama canal, and that she may therefore ask any sum she pleases for rental of the necessary territory, she will get a most rude awakening. All depends now upon a reasonable proposal by the Colombian Government. It should not forget that there are many men in Congress opposed to paying anything whatever for right of way.

It is apparent that the provisions for general subsidy in the pending Frye bill are introduced for amendment, and that various specially objectionable features of former bills have been temporarily withheld for the purpose of allaying Republican opposition. But, in spite of this, the new bill as it stands shows the essential injustice of any system of general ship subsidy; that is, the injustice of any subsidy except such as is paid for the purpose of calling into being new means of communication to specified foreign ports, to which such means are now lacking, and where they could not exist without Government aid. Among the iniquities of the pending bill is the fact that nothing in it will prevent an empty ship from collecting a full subsidy. This will interest those who are contending that the bill will operate to increase our commerce, and who allow that subsidies should be paid only in proportion to the cargo carried. Then there is the same old provision about vessels owned by corporations; that is, if the corporation is formed in this country, the stock may really be owned by foreigners, and the subsidy paid out of American taxes may all go as dividends to foreigners. There is no provision in the bill which will secure the establishment of any new means of communication, or will prevent the Government funds from going as a bonus to increase the dividends of those al-

ready engaged in the shipping business, even though they provide no increased facilities for the public. There is no adequate guarantee that the subsidy will not eventually be given to foreign-built ships whenever Americans consider it for their interest to buy these ships and to obtain a special American registry for them, as has so frequently been done in the past by the companies which are pressing this bill.

Senator Nelson's bill to establish a Department of Commerce has passed the Senate with comparatively little opposition. On Wednesday week that body received a letter from Mr. Gompers, President of the American Federation of Labor, protesting against the transfer of the Bureau of Labor to the charge of the new Secretary. The trouble is the old one of "saving my order." Nobody objects to the establishment of a Department of Commerce, but nobody wants to see his particular interests incorporated into a general scheme of organization, even if such a scheme would conduce to the public good. Mr. Gompers puts his objection bluntly. The Bureau of Labor, he says, was organized at the request of the labor interests of the country, in the hope that it might ultimately become one of the executive departments of the Government, with a Secretary of Labor in the Cabinet. If it should be incorporated into any other, the "interests of labor" would be "minimized." In the end the new department was dubbed "of Commerce and Labor." A tendency of quite another sort was displayed by Senator Quarles's defeated amendment vesting the new Secretary with power to supervise the collection of statistics on commercial subjects made by the other departments of the Government.

Interviews with the officers of several national banks in New York indicate that there is general opposition to Representative Lloyd's bill permitting national banking associations to make loans upon real-estate security. Although the bill limits the amount of advances on real estate to 25 per cent. of the total loans of any bank, those who have been consulted are practically unanimous in condemning the plan, because real-estate security is not a quick asset. This, however, is not the only objection to real-estate loans. There is always a question about even the ultimate value of the property offered as security, and it often happens that banks find it necessary in times of depression to take over the real estate on which they have made loans, in order to protect themselves against the loss which would result if the property were suddenly thrown on the market. The fact is that no such extension of activity as the making of real-estate loans should be granted to any commercial bank, least of all to those which hold the reserves of the country, and may be called upon at any moment to furnish the current funds needed to meet sudden demands for cash. Further, as Mr. A. B. Hepburn points out, the banks in the large inland cities are often quite as important factors in maintaining the solvency of the country as are those of New York, since our system of reserve cities places in their hands the balances of the surrounding country. The national system must be made more attractive to capital, not by weakening the legitimate restrictions that have been thrown about the business of banking under it, but by removing the unnecessary ones which prevent the banks from using their credit by note issues.

The continued decline in the national bank currency and the withdrawals of deposited bonds from the Treasury indicate with renewed force the necessity of taking measures for revenue reduction. Secretary's Gage's policy in keeping the surplus down by means of bond purchases is effective enough as a temporary measure, but it results in raising the price of the bonds, and making it more profitable for the banks to sell them than to use them as a basis for circulation. It not merely raises the price of the outstanding bonds, but, should it continue, will take all the purchasable bonds out of the market. The national debt is now $105,000,000 less than during the summer of 1899. During January alone, purchases of bonds by the Treasury have amounted to a par value of $3,734,160, requiring an expenditure of $5,285,371 for the payment of principal and premiums. How the bond-purchases tighten the market is shown by the decline in offers of bonds to the Treasury from nearly $12,000,000 in November to less than $4,000,000 during January. Moreover, the bond-secured circulation, which stood at $328,845,067 in September last, will have been reduced to $317,500,000 at the end of March, and there is no apparent reason why the decline should stop at the last-mentioned figure. Evidently Congress must find some way, consistently with the safety of the noteholders, to take off the shackles from the national-banking system.

Some exceedingly interesting testimony regarding last year's Northwestern railway deals was submitted on Saturday at Chicago. We imagine that the public mind will be chiefly impressed by Mr. Harriman's testimony as to the use of the Union Pacific's credit in the operation. This witness had stated that, to-day, neither the Union Pacific, Southern Pacific, nor Oregon Short Line owns any Northern Pacific stock. This was, of course, not news, the transfer of the stock having been part of the Northern Securities Company settlement of last autumn. Succeeding inquiries established three points: first, that the rich corporation, the Oregon Short Line, which bought the Northern Pacific stock at a figure "several times larger than its own capital stock," had to borrow the money for the purchase; second, that it apparently did not buy this $78,000,000 worth of stock for investment, but for strategic purposes; and, third, that corporations which make such purchases are quite at liberty to sell out again to anybody. As to the purpose of the purchase, it was, Mr. Harriman alleged, "to preserve to the Union Pacific the avenues already open to it," and to "develop an opinion that we were strong enough to control traffic in our own territory." The stock, Mr. Harriman testified, has been sold without loss to the Union Pacific Company; in other words, the operation resulted more agreeably than the Reading Railroad's by no means dissimilar operation of 1892. But we are nevertheless inclined to think that the public will do some sober thinking over this sort of use of corporate capital and credit. Mr. Harriman obtained his strategic purposes and sold out the stock without loss to his company. But who is to guarantee that the next exploit of the kind in the railway world will have the same ending?

The New Jersey Republicans have chosen as United States Senator a man who would never have been heard of in public life but for his money. The business career of the caucus nominee, Mr. John F. Dryden, has been long and successful, but of his political activity the most that is said of him by even his eulogists is: "To the party organization he has been a generous contributor." We have thus another rich man elected to the Senate simply because he is rich. We know nothing whatever against Mr. Dryden, and sincerely hope that his undoubted energy and business capacity may prove of service to the public; but what we say is, that, by the people of the State and by the country at large, his election will be regarded simply as one more step in the commercializing of the Senate. Of his opinions, or of his ability to state and defend them, nothing is known; whether he can draft a bill, what his capacity may be in committee work, what amount of intelligence he may bring to the routine of legislation—all this is an unknown quantity. One of his competitors, ex-Gov. and ex-Attorney-General Griggs, stood for the older Senatorial tradition. He is a skilled lawyer and an able speaker, has had a wide experience of public affairs, and would have distinctly added to the Senate what it most needs—intellect, not money. But he is passed over for a man whose one title to the honor is his wealth. We cannot regard this as an auspicious event.

AN INDEFENSIBLE ACT.

On January 8 Senator Lodge introduced a bill "temporarily to provide for the administration of civil government in the Philippines." One object of this measure, which does not establish a new form of government, is to confirm the action of President McKinley in appointing the present Philippine Commission, and "to approve the acts of the Commission up to this time." In view of the latter purpose, it would be well for the American people, and also for Congress, to know something more about the legislative acts of the Commission, particularly as Secretary Root has hoped that "the work of the Commission will receive the approval which it merits." This work he declared to be praiseworthy "for its high quality of constructive ability, its wise adaptation to the ends desirable to be accomplished, and its faithful adherence to the principles controlling our own Government."

That this praise should apply to a large part, or even the greater part, of the work of the Philippine Commission may very well be. There is one achievement of the Commission in its character as sole legislature in the Philippines, however, which should receive only condemnation from Congress and the American public. This is a statute which became the law of the Philippine Islands on November 4, 1901, and which is verbosely entitled "An Act defining the crimes of treason, insurrection, sedition, conspiracies to commit such crimes, seditious utterances whether written or spoken, the formation of secret political societies, the administering or taking of oaths to commit crimes or to prevent the discovering of the same, and the violation of oaths of allegiance, and prescribing the punishment therefor." It is on its face a measure to assist the military in forcing the sovereignty of the United States down the throats of the Filipinos, and to prevent them from continuing their struggle for independence. Like all similar acts in all lands, it is of an essentially despotic character.

Its first section prescribes the penalty of death or imprisonment at hard labor for not less than five years, with a fine of not less than $10,000, for the crime of treason—that is, levying war or adhering to the enemies of the United States or the Philippine Government. In this it parallels the statutes of the United States. But in Section 5 the law goes beyond anything now upon the statute-book of the United States, and defines as sedition the infliction of any act of "hate or revenge" upon any official of the Government, or, "if with a political or social object," upon individuals, or any class of individuals. These crimes it punishes by a fine of not over $5,000 and imprisonment for not more than ten years. Conspiracy to commit the crime of sedition carries with it a punishment of not more than five years in prison and of not more than $1,000 fine. Going a step further, the taking of an oath to engage in a seditious project, or to bind one to fail to reveal any unlawful combination, is punished by the last-named penalty, as is the action of one who merely attempts to induce a person to take such an oath. But the climax of this extraordinary law is to be found in the following sections:

"Sec. 8. Every person who shall utter seditious words or speeches, write, publish, or circulate scurrilous libels against the Government of the United States or the Insular Government of the Philippine Islands, or which tend to disturb or obstruct any lawful officer in executing his office, or which tend to instigate others to cabal or meet together for unlawful purposes, or which suggest or incite rebellious conspiracies or riots, or which tend to stir up the people against the lawful authorities or to disturb the peace of the community, the safety and order of the Government, or who shall knowingly conceal such evil practices, shall be punished by a fine not exceeding $2,000 or by imprisonment not exceeding two years, or both, in the discretion of the court.

"Sec. 10. Until it has been officially proclaimed that a state of war or insurrection against the authority or sovereignty of the United States no longer exists in the Philippine Islands, it shall be unlawful for any person to advocate orally or by writing or printing, or like methods, the independence of the Philippine Islands or their separation from the United States, whether by *peaceable* or forcible means, or to print, publish, or circulate any handbill, newspaper, or other publication, advocating such independence or separation. Any person violating the provisions of this section shall be punished by a fine of not exceeding $2,000 and imprisonment not exceeding one year."

Plainly, the proper title for this act should have been "A Bill to Put an End to Freedom of Speech and the Liberty of the Press in the Philippines, and to Create a Nation of Spies and Informers"; for such is the purport of the provisions cited, and such will be the inevitable results of the law if it should be rigidly enforced. When it was before the Commission, some of the friendly Filipinos, and also Señor Buencamino, who represented the Federal party, protested against it on the ground that it would undo the beneficial effect of the benevolent speeches of members of the Commission when they first arrived in the Philippines. The Manila *Times* did not hesitate to tell the truth about the act. "There is no loophole left by it by which any man who is disaffected towards the Government in these islands, and so expresses himself by word or act, can escape. Even the secret knowledge of covert workings against the sovereign power in these islands is sufficient to make one culpable and amenable to the new law."

Evidently the new Liberty which typifies the United States abroad should fling away the torch of enlightenment for the bayonet, since her mission in the Philippines is plainly not to encourage men to be free, but to think only what her armed representatives deem wise. One of these, according to Representative Gaines, has declared the Constitution of the United States "a d——— incendiary document"! In what way such a policy as this Philippine one differs from the oppression of Russia in Finland, or that of Turkey in Armenia, it would be very interesting to know. Was there any law of King George the Third as arbitrary or as hard upon his American colonists as this when they revolted? We know of none. And yet Mr. Root would have us believe that the Commission, in all its acts, has "faithfully adhered to the principles controlling our own Government." Only once in its history has this Republic turned to such an extreme law, and that in 1798, when the famous Alien and Sedition Acts were passed, only to be repealed within a few years. "Let us not establish a tyranny," protested Alexander Hamilton, whose own party was passing these acts. Is it not a tyranny which the Philippine Commission has established by its sedition act?

Theodore Roosevelt recently named three characteristics or attainments as the necessary equipment of any man fitted to do useful work in our body politic. One of these he defined as "some knowledge of history." It would seem as if the members of the Philippine Commission were wilfully ignorant of some of the most tragic pages in modern history. For if they were familiar with the struggles for liberty of men under the tyranny of despots or under foreign oppression, they would know full well the futility of trying to overawe men's minds and spirits by threats of prison bars. The dungeons of Russia, the convict hovels of Siberia, the prison stockade on the island of Guam, all attest this truth.

THE SENATE AS TREATY-MAKER.

The ups and downs of the treaty with Denmark for the sale to us of St. Thomas, which is at last before the Senate for its approval, throw an instructive light upon the theories of Senator Lodge respecting the treaty-making powers of the Senate. He holds, in his *Scribner* article, that the Senate must be consulted in the framing, as well as in the ratification, of treaties. Of course it needs a negotiator, since the Senate cannot directly deal with foreign governments, but there stands the Secretary of State ready to carry out the Senatorial behests. Let him first find out what Senators want, then let him negotiate. Ratification will follow as a matter of course. Such is the Lodgian view.

The Danish instance, however, shows that, whatever may be said of the Constitutional questions involved, the practical application of these notions would make an end of all negotiation. The treaty with Denmark has been hanging fire for a year or two. There has evidently been a great deal of diplomatic give-and-

take in connection with it. The Danish Government wants to know what commercial and political rights its West Indian subjects would have under the American flag. It is also thought to have insisted that they be allowed to vote on the question of American annexation. But must Secretary Hay poll the Senate on each one of all such questions arising in his correspondence before he dares to put pen to paper? Must he consult, not his chief, the President, not his colleagues of the Cabinet, but ninety Senators? We hear of a plébiscite in St. Thomas. But Lodge would have a plébiscite in the Senate before this or any other particular could be passed upon by our Secretary of State. If Mr. Hay were to conduct his department with the proper fear of Lodge before his eyes, he would have to keep foreign ambassadors waiting till he had called the roll of the Senate. This would not be very dignified, and it certainly would bring diplomatic business to a standstill. Diplomacy is at best a leisurely affair; this plan would make it a veritable Dead March. By the time that a Secretary had laboriously sounded the opinions of ninety Senators, a new Senate might come in, and the work would be all to do over again. Treaties could not be framed on such terms. No self-respecting man would consent to make himself, while nominally in charge of our foreign relations, in reality nothing but the errand-boy of the Senate, to deliver its messages to other countries.

What Senator Lodge really proves, in his magazine article, is something which nobody ever questioned—namely, the Constitutional power of the Senate to accept or reject a treaty made by the Executive. In this is implied the power to amend a treaty, if the Senate is willing to run the risk of defeating it thereby. To the assertion of this obvious truth, Senator Lodge comes forward with a great array of learning and eloquence. With triumphant logic he establishes what no man disputes, and wreaks himself upon a platitude with the enthusiasm of a Tupper. He thinks, of course, to slip into his Constitutional argument the inference that the power to ratify means the right to be consulted beforehand as to the thing to be ratified. Of course, an arrogant Senate may assert that right, if it can find a Secretary and a President weak enough to yield; but that it is fairly to be deduced from the grant of power made in the Constitution, is another story. Even if the law were good, the consequences would be so disastrous, and would so make an end of American diplomacy, that the practice ought not to be adopted. Indeed, even Lodge himself sees this, and observes that the Senate has "wisely refrained," as a rule, from exercising its "right" to negotiate treaties.

He is not very happy in the little lecture which he reads Lord Lansdowne upon that Minister's ignorance of the American Constitution. Lansdowne's refusal to accept the Hay-Pauncefote treaty as amended by the Senate, Lodge thinks due to entire "misapprehension" of the Senate's rights in the premises. But if the Senator had taken the trouble to read the British Foreign Secretary's minute on the treaty, he would have discovered that there was no reference to any unwarrantable action by the Senate. It was only because the American Ambassador laid the Senate amendments before the British Government that the latter took notice of them. And Lord Lansdowne pointed out, what was perfectly true, that these changes had been proposed without any previous attempt to see if they would meet British views. He added, moreover, that the American Government had before expressed to Lord Pauncefote not only its complete satisfaction with the treaty as it originally stood, but its "appreciation of the conciliatory disposition shown by her Majesty's Government." Here we get a vivid glimpse of the humiliations which the Lodge idea of treaty-making by the Senate would heap upon the American President and Secretary of State and the nation itself. It would give us the inevitable air of not knowing our own mind two days running. Our negotiators would be without authority. Our treaties would be waste paper before the ink on them was dry. We agree with Lodge that the Senate would indeed be "wise" to refrain from exercising a shadowy right which would lead directly to such lamentable results.

Lodge's precedents are not in point, except as they show that a President may consult the Senate in advance if he chooses. This, also, is one of those undisputed propositions which Senator Lodge argues with splendid power. He cites the example of Washington going into the Senate in person with an Indian treaty. Of course, the Senate was then practically a Privy Council, and the President could meet with it in secret, if he wished. So he can seek to know its mind now, no doubt, before taking any given action. The Washington case, if we remember aright, was the one described in Maclay's 'Journal,' when the first President rebuked the Senate for defeating his plan. It was then, as Maclay wrote, that "if the Father of his Country could ever be thought to look angry, he looked angrily at me." If that glance of wrath were to be seen in the Senate of to-day, we suspect that it would be directed towards the seat of the junior Senator from Massachusetts, on hearing his contention that the Senate possesses the power to negotiate treaties, and may exert it whenever it sees fit.

FEDERAL CLEARING-HOUSES.

A bill was introduced in the House on the 7th inst. by Mr. Pugsley of New York, to provide for a more elastic currency than the National Bank Act supplies. This has long been a desideratum, to the securing of which many minds have been working. Everybody who understands our present system knows that our banknote currency does not adjust itself to the demand for it. The demand for money in the commercial centres, where business is transacted mostly by bank checks, is met promptly and easily by the discount of commercial paper, taking the form of deposits. The proceeds of the discount are credited by the banker in the customer's passbook as a deposit, and the customer draws his checks against the same, exactly as though he had deposited there an equal amount of gold. When we speak of an elastic currency, we mean a system by which banknotes may be issued as promptly and readily as bank checks, so that when the customer's paper is discounted, he can draw the money in banknotes, if he chooses to do so. It may be asked, What prevents him from doing so now? In a single case he could do so, but if a large number of cases should come upon the bank simultaneously, its cash reserve would soon be exhausted, and it would be compelled to stop discounting.

If it could issue its credit in the form of its own notes, it could safely discount as much paper in that form as in the form of deposits. The reason why the bank cannot respond to the demand for notes as readily as to the demand for checks is, that the law requires the security of United States bonds before notes can be issued. This fact not only makes the currency inelastic, but makes it dependent upon the bond market. Any demand for bonds for other purposes than those of banknote issues contracts the circulation, even in the face of a demand for more circulation. The latter process is going on now. The Government itself is a buyer of its own bonds. It bids up the price. It offers a temptation to the banks to retire their circulation and sell their bonds, in order to pocket the premium. The law allows not more than $3,000,000 of banknotes to be retired each month. This is the rate at which the withdrawal is now going on. But for this limitation the retirement would be more rapid.

The bill introduced by Mr. Pugsley embodies the ideas presented by Mr. Theodore Gilman in his book on 'Federal Clearing-Houses.' It goes upon the theory that, if the clearing-houses of the country would unite in guaranteeing the goodness and prompt redemption of banknotes, taking the assets of the issuing banks as security and uniting their capital and credit to this end, such notes would be absolutely safe, and the security of Government bonds might be dispensed with.

The bill has two ends in view. One is

to provide a safe and elastic note issue. If the object of the bill could be carried out and the banks of the country be grouped into national clearing-house associations of sufficient size, there is no doubt that notes issued upon the combined responsibility of these associations would be perfectly secure. The second object is to relieve the business interests from the embarrassment and actual damage done by the constant absorption of money by the Treasury and by its withdrawal from the channels of circulation as customs and internal revenue are collected—this to be done upon a security satisfactory to the Secretary of the Treasury. The provisions of the act are vague, cumbersome, and unwieldy. It would be simpler to let the Secretary deposit with the individual banks in his discretion, upon security furnished by them to his satisfaction, and to pay interest upon such deposits. It would be safe to deposit with the associated banks of any clearing-house district without security, but it would be exceedingly difficult to determine the method of doing this, and no one bank would be disposed to become security for the others. The same criticism applies to circulating notes. The strong banks would refuse to be responsible for the note issues of the weaker ones. Section 13 of the bill proposes to tax all clearing-houses that do not come into the system one-one-hundredth of 1 per cent. on all of their exchanges. This forcing process, we fancy, will get very little support in Congress, yet without the application of force it is not likely that the banks will adopt the proposed plan.

The great virtue and efficacy which clearing-house associations possess is that they are not incorporated bodies. They are under no supervision or constraint, and in times of crisis they can do what is deemed to be wise and necessary to meet the situation, unhampered and unrestrained. Under a law like the Pugsley bill these associations would be relegated to the status of regular corporations, governed by law, interpreted and administered primarily at the Comptroller's office. We might very likely have an incumbent in that office who would not be able so to grasp the situation in a time of crisis as to meet the emergency. Besides, if clearing-house associations were incorporated, they would be subject to injunction and mandamus, and the speculative interests in the Street might interpose judicial processes to prevent or enforce action or otherwise embarrass such an association for no other purpose than a speculative one. Such speculation would naturally be on the bear side.

The crux of the matter lies in the question, Will those clearing-houses which have the financial strength to command the confidence of the country consent to assume the duties and responsibilities assigned to them? Until some evidence is presented that they would do so, it is needless to consider the details of the measure.

BOOK COLLECTORS AND OTHERS.

For some weeks past the dispatches have been full of sensational purchases of works of art—a half million paid for such a Raphael, and a cool million offered for a Titian. To-day we are bid believe that the entire Borghese collection is to become the property of one of our countrymen, and the rather dubious rumor is at least taken seriously enough in England to arouse against the sale vigorous protest "in behalf of the civilized world"—excluding, naturally, the Americas. The collectors who buy Raphaels and Titians and galleries *en bloc* might be called the "strong-arm" men of the fraternity. They have in their unlimited wealth an unfailing argument, and they may easily dispense with the guile which is the most salient characteristic of the true collector. It is this fact which, while their conquests are viewed with a kind of fearful admiration, puts them generally out of the pale.

The collector's instinct is like genius, in that it is based upon an infinite capacity for taking pains. It is this which has brought much ridicule upon the craft. And, in fact, money values do come to depend upon the infinitely little. At a book sale the other day a first edition, 1846, of Hawthorne's 'Mosses from an Old Manse' was sold. The book generally is of no great rarity, fetching ten dollars, or thereabouts. But the copy in question was "in the original paper covers as issued," and the fact that no one had taken the pains to bind the two volumes properly was responsible for a price of $170. In the same sale a first edition of Emerson was commended because its paper label was in perfect condition; a crack, a finger-mark, a dog-ear, or a torn corner would notably have lessened the value of the copy. It might be said that these discriminations are often based on reason. One would rather have a clean copy of a book than a soiled, a fair white margin than a page cropped to the headlines. A margin, too, is a pleasing thing around a print, and early states of a famous etching are often preferable, on artistic grounds, to impressions from the finished plate. But these considerations do not explain sufficiently the startling caprices of collecting values—as the fact that Thackeray first editions, neatly bound, may be had for a song, while the same volume in its original serial parts, with the advertising pages and the ugly yellow-paper covers, may be worth a missionary's ransom; that we pay in banknotes for every centimetre of extra height of a rare Elzevir, and must cover every sixteenth of an inch of margin about a Rembrandt print with gold.

What is really paid for in every instance is simple rarity. The unique copy or impression is the ideal for the enlightened collector; and the anecdote which relates how a famous bibliophile pleaded with an associate for a certain book, raised his offer to an irresistible price, and then threw the book into the fire with the taunt, "Now my copy is unique," expresses the spirit in which many collections are made. A kind of madness Dibdin called it, and yet a madness which is fully justified of its children; for the supply of collectors is unfailing, that of desirable objects ever less. This makes a collection which has been shrewdly assembled with due regard to condition and speculative value one of the very best investments. And it must be said that very little collecting is free from this taint of commercialism. The books in a great private library are usually too valuable to be used, even if the collector, which rarely happens, is a reader also. His prints are of a kind too precious to be framed, his china too good for household use. What is he but, on the one hand, a dealer for probable or possible resale, or, on the other, an irrational idealist, in the pursuit not of the beautiful, but simply of the rare?

But the anti-social nature of collectors—their neglect of wife and family for the rare example, their disingenuous wiles for catching the unwary dealer or the ignorant owner—have been fully exposed by members of the craft; and since collectors glory in these things, the severe moralist finds their case beyond the power of rebuke to reach or of warning to stay. It should be said, however, that there is a kind of collector who is free from this reproach. Dealers do not favor him, or even admit that he is a collector at all, though they depend largely upon his enthusiasm for their support. He is unknown to the famous salesrooms, but a familiar figure at the book-stalls and smaller shops. This collector buys the books which he loves in the form in which he loves to read them. He buys cheap, and often wastes his money, but he satisfies his soul. His attitude towards books is a sentimental one. He is not wise about margins, and labels, or even about editions; but he loves the smell of old Russia; he knows, with Charles Lamb, that Beaumont and Fletcher never taste so good as when taken in folio; or he may have an invincible prejudice against reading Chaucer except in black-letter. He values books for their human associations, for all the homely signs of use, the scribbled "valde absurdum est" on a margin, or the signature of a former owner which defaces a title-page.

Only this kind of collector, after all, knows the real luxury of possession. His books, when he is beyond using them, may cut but a sorry figure in the

salesroom, and his heirs and assigns may resent the thriftlessness which was willing to amass such merely personal treasures as are negotiable only at an appalling discount; but he himself should have the pardon of him who has loved greatly. We should not fail to admire the minute special knowledge, the painstaking sagacity, and the fanaticism in the quest exhibited by the great collectors of whom history takes account. But we do well, also, to praise the obscure and disinterested collector who loves his possessions for their own sake; and we may well suspect a definition so rigorous as to exclude from the line of collectors Charles Lamb, who loved old books with a kind of passion, and Sir Walter Scott, who made Abbotsford a veritable museum of objects which, apart from their personal associations, were of pitifully slight value.

HAVANA.

December, 1901.

Though Havana is by no means the oldest seat of Spanish power in Cuba—it is, indeed, the sixth in order of the places from which the island was governed from the days of Columbus to those of Gen. Blanco—its fame, its commerce, and its population so far exceeded those of all other cities in the Antilles and all round the Caribbean Sea, whether Spanish, French, or English, that the visitor approaches it with high expectations of finding a place with a dignity of aspect and a richness of interest corresponding to its history and its importance. In some respects he is disappointed. Of architectural beauty there is very little. The Cathedral, from which some of the remains of Columbus were recently carried back to Spain, is a heavy building, not very large and not very handsome, though the interior, being dignified and well-proportioned, is rather better than the dull exterior leads one to expect. It is not even very old, though the decayed aspect of the coralline limestone of which it is built gives it an air of antiquity. Neither has any other church any considerable merit. There are no striking towers, and but little of that rich ornamentation on the façade or on the doorways which gives a character to many of the churches of Spanish America. The military edifices are not much better. Morro Castle, of whose situation I shall presently say something, is modern, a good specimen of the fortification work of the eighteenth century repaired some seventy years ago, but destitute of beauty or even of picturesque character. The older fortress, on the west side of the entrance to the harbor, is remarkable from its massive solidity, its low gateways, and immensely thick walls enclosing gloomy dungeons, but is equally without architectural merit. Some of the palaces of the seventeenth and eighteenth centuries have handsome internal courtyards—*patios*, as the Spaniards call them—with rows of good columns and stately staircases; but very few of these show any street front worthy of note. Here and there one finds pretty bits of iron work, but the streets are generally devoid of such architectural features as give charm to the cities of Spain, Portugal, and Italy.

In the older part of Havana, close to the fort, the thoroughfares, straight, as in all Spanish colonial towns, are narrow and the houses high, and there are sometimes arcades of pillars along them, sometimes awnings drawn from side to side. This part has therefore a kind of picturesqueness, enhanced by the occasional occurrence of small plazas or open spaces, and by the effects of light and shade which one gets in narrow streets with a strong sun and brilliant sky overhead. In the newer parts the streets are wider and probably healthier, but they are even more uniform in the style of building, with little or nothing on which the eye cares to rest. One gets the impression of a city in which there was neither an aristocracy desiring to assert itself by raising stately town houses, nor a body of merchants proud of their municipality, and willing to spend their substance in decorating their dwelling-places as the merchants of mediæval Italy or of the Hanseatic and free imperial cities in Germany were wont to do. This is natural enough when one remembers that Havana never had either a territorial or a commercial aristocracy. It seems strange, considering how rich the Roman Church was in Cuba, that neither bishops nor convents should have devoted more of their revenues to the erection of imposing or ornate ecclesiastical edifices, such as are found in some other parts of Spanish America, as, for instance, in Mexico. Thus there is really comparatively little to see in this famous capital of the Antilles. So far as architecture is concerned, a forenoon's walk is sufficient to show the tourist all he is likely to care for.

But if the student of architecture experiences some disappointment, if the historian finds comparatively little which can aid his imagination to reconstruct the earlier annals of Spanish rule, if the lover of costume and the aspects of social life notes less that is peculiar than he expected, there is, nevertheless, a measure both of beauty and of attractiveness in Havana. It recalls some of the famous cities of the Mediterranean in the brilliance of its light and the striking features of its situation. It stands on the west side of an inlet of the sea, two to three miles long and less than half a mile wide at its mouth. This is the haven which gives its name to the city, and which affords a perfectly safe and good anchorage with a depth of water sufficient, if not for the very largest Atlantic liners, yet for all the vessels that use, or are likely to use, the port. The older part of the town stands on nearly level ground along the harbor. The newer part is on rising ground further back, and has spread northward so as to face the sea outside the harbor, while the suburbs stretch still further along the north coast and inland over the acclivities of wooded hills to the west. Thus, as the visitor approaches in a ship, he sees a mass of white buildings rising on a gentle slope, backed by verdure, above the bright blue waters, usually (in winter) crisping under the northerly breeze. On the further side of the harbor entrance Morro Castle stands upon a high, rocky cape, against which the waves are always foaming, while a little further up the inlet the picturesque pinkish-white walls, now half dilapidated, of the old castle of Cabana crown the crest of a long cliff. The bay within is dotted with shipping, and at its head green hills, as yet untouched by houses, make a charming background, recalling (save that the glittering mosques and the sombre cypresses are absent) the head of the Golden Horn at Constantinople. Neither are pretty bits wanting inside the city. Both the large square called the Parque Central and the Prado, a long, wide avenue running northeast and southwest from that square, are filled with fine trees, many of them bearing brilliant flowers. So, too, in the suburbs there are groves and gardens of great beauty, with hills behind, whence lovely views over the bay and the sea are disclosed, Morro Castle forming a superb central point. At a spot called Vedado, some four or five miles to the west along the coast, a suburb is springing up which will, when the trees planted round the villas have grown taller and the roughness of the newly-made roads has disappeared, be an extremely attractive place for visitors, since it is fresher and healthier than the city and has a good hotel, which was much used by American officers in the early days of the occupation. An excellent service of electric cars connects it with Havana, and there is good sea bathing, though the Cubans, who have the horror so common among southern peoples of entering the sea during the cooler months, leave off bathing and shut up their establishments after the middle of October. To a visitor from the North, the water is delightfully warm even in December.

The American occupation has already done wonders for Havana. Yellow fever has been practically extirpated by the efforts of Gen. Wood and the admirable medical staff that works under him. Rubbish is no longer permitted to be thrown into the harbor. The streets have been cleansed and are now kept in excellent order. The remains of the old walls of the city, which the Cubans desired to clear away, have been preserved, and now form, in several places, singularly picturesque memorials of remote Spanish days. So, too, an ancient fortification on the west edge of the harbor mouth has been saved from destruction, and a handsome promenade laid out, whence a charming view can be had over the sea and across the inlet to the cliffs crowned by the castles of Morro and Cabana. (It is a curious mark of the insensibility of the Cubans to historical sentiment that they do not care for the antiquities of the city, and they actually insisted on removing a statue of Queen Isabella the Catholic, which stood in one of the plazas, a sovereign for whose gracious memory even those who rose against Spanish rule might have been expected to have some reverence.) Of all these services the greatest is the extinction of the malady which has so long cursed the coasts of the Gulf and the Caribbean Sea. The stamping out of yellow fever not only has been a blessing to Cuba, but gives great hope of relieving from the danger of its attacks Galveston, New Orleans, and the Gulf ports of the United States. Moreover, an example has been set which Vera Cruz may soon follow, and which may ultimately be followed even by La Guayra, Buenos Aires, and Rio de Janeiro.

As respects the inhabitants of Havana, the stranger finds less beauty of face or

costume among the women than he has been led to expect. The mantilla is not general; nor do the dresses generally show much of the grace and picturesqueness one associates with Spanish countries. Among the younger women there are many good figures as well as fine eyes; but Cadiz in the Old World and Baltimore in the New have a much higher proportion of handsome faces. Neither men nor women give the impression of a vigorous race; and, indeed, the most industrious and intelligent element in the population (excluding Americans, Germans, and Englishmen—the two latter not numerous) is that which has come lately from old Spain, and especially from the northern provinces—Catalonia, Asturias, Galicia, and the Basque districts. Between them and the native Cubans there seems to be now no ill-feeling, and a good deal of the commerce of the city is already in their hands, or is passing to them.

That the commercial activity of Havana depends upon the general prosperity of Cuba, and especially upon the agricultural development of the island and the construction of railways through it, goes without saying. At present the uncertainty of the political future checks new enterprises and keeps everything in suspense. It is, therefore, the less surprising that there is a want of bustle in the streets, and that the shipping in the harbor is not very numerous. Among that shipping there still stands out of the water one ghastly skeleton. It is the wreck of the *Maine*, which no one is in any danger of failing to remember.

THE REAL CHAUDIÈRE.

NEW YORK, January, 1902.

When I read Gilbert Parker's 'Right of Way' by instalments, I wondered where his Chaudière might be, for I knew the real Chaudière some half-century ago, and his picture of the people and their manners bore no resemblance to the reality. I am relieved to learn, from the preface to the book, that the Chaudière of the story had no existence, except in the author's imagination. The actual Chaudière and its people remain in my recollection as an idyll of primitive purity and simplicity.

The Chaudière River heads near the height of land between Maine and the Province of Quebec, and its waters almost interlock with those of the Kennebec. It was, therefore, from the earliest days—long before Arnold led his troops through it—a waterway between Quebec and the New England colonies; for, though turbulent for some distance above its mouth, where it leaps by its picturesque falls into the St. Lawrence, the upper stretches of the river are so slightly ruffled that the Indians and the Canadian voyageurs could paddle their canoes, with only one portage, for about forty miles. The fertile valley through which it flows in this section of its course was, early in the eighteenth century, parcelled out as seignories of twelve miles by twelve miles in extent to French immigrants of note. And as the land was rich, it was soon taken up by tenants, many of whose descendants still occupy the farms of their forefathers; for the seignorial tenure of land encouraged permanency of occupation. The tenant paid the seigneur only a trifling annual rent of one or two sous per acre, and the farm and its improvements descended on the same terms to the tenant's heirs. But if he sold his holding to a stranger, the seigneur was entitled to *lods et ventes*, or a commission, amounting to a large share of the price. Transfers were, therefore, costly and rare, and generation after generation of the same family occupied the same land, cutting it up, however, into strips, as heirs multiplied who refused to emigrate from the parish, until the attenuated farms became too small to supply even the slender wants of the simple folk who cultivated them.

Some sixty years ago, in the bed of one of the streams flowing into the Chaudière through the Parish of Saint François, a girl picked up a curious stone, which was recognized to be a nugget of gold. But the discovery, though noted by Capt. Badderley in the Transactions of the Literary and Historical Society some years afterward, created no excitement. California and its gold had not loomed up to inflame the imagination of the world; and, to the primitive folk of the Chaudière Valley, the discovery of a nugget was of less moment than the birth of a baby. It had been better for my father's purse had he been as impassive as his countrymen, but he first joined a few other enterprising spirits in buying from the seigneur the right to work the auriferous gravels, and, the company failing, he then undertook alone the unprofitable task. And thus it came about that I spent two pleasant summers among the gentle, courteous *habitants* of the Chaudière Valley.

My job was to superintend some gravel workings on a small stream called after the family who owned the land at its mouth, the Deplante. The farm, of ample width originally, had been subdivided among three branches of the family. One eked out a living by blacksmithing, another had some skill as a carpenter; my host, as the head of the Deplantes, disdained other occupation than farming, which, however, he practised, not in person, but through the members of his family. These consisted of a wizen but shrewd old woman, the wife, who was profuse in her professions, and refused to name any price for her hospitality, but, if her "ce que vous voulez" was not responded to as liberally as she expected, left no doubt in your mind that you had been guilty of disgraceful meanness. It was well she had some business capacity and ambition, for her husband had none. He dreamed and slept his life away in the barn. Some of the hay was always sticking in his shaggy, tawny shock of hair. He was the infidel of the village. He never went to mass, but his heretical notions were not very clear, and he recognized the force of public opinion sufficiently to wisely shut them up in his own muddled brain—except to an admitted heretic. They really consisted of little else than an admiration for a shadowy Voltaire, who he said was "un grand homme. Il a écrit soixante-dix volumes, monsieur." His indolence was inherited by his eldest son Olivier, but the younger son, François Xavier, was an active but rather disagreeably pushing youth, who ultimately broke up the ancestral home; for, years afterwards, when I drove up the Chaudière, the old people had died, the girls had married, the boys had flitted, and the place knew the Deplantes no more. The other members of the family were four girls. The eldest, Euphrosyne, a good-natured, strapping girl, did most of the outside work; Pélagie was the wit of the family; Ellen was a pale-faced, light-haired beauty, who seldom or never spoiled her complexion by field work, but was the family seamstress; and Marie, a bright little girl, was at the village school. She subsequently was sent to the Ursuline Convent in Quebec to complete her education, by fitting herself to become the village schoolmistress in turn.

There were four of us, all in search of gold dust in the bed of the Deplante stream, who wished to board with the Deplantes; but the house contained only two big rooms and the garret. The outer room was the kitchen and living-room, with its big fireplace and its deal table and home-made chairs, whose bottoms were woven out of the underbark of the cedar. The wrought-iron lamp, of the exact shape of those used by the old Romans, filled with tallow, in which a wick was immersed, and which hung from a notched stick secured to the ceiling, gave a dingy light for the short space of evening between suppertime and bedtime, for the family engaged in no literary pursuits. The inner room contained four huge bedsteads, one in each corner, so high that agility or a ladder was required to enter them. What members of the family occupied them when we were not there, we had, of course, no means of knowing. When we were there, the old couple and the girls climbed into the garret, the boys slept in the barn. But to sleep four in a room, even though each occupied a separate bed, was not consistent with our habits; so we suggested that partitions might, without much cost, be thrown up. The mere mention of a change in the architecture of the old wooden house threw the old man into a panic. It was the only occasion in our acquaintance when we observed the slightest disturbance in the placidity of the poor old fellow's temper. His great-grandfather had built the house, and to touch it was a profanity. He could not—he dare not. But, as the alternative was our leaving, the cupidity of the old lady overcame the old man's scruples, and the partitions were knocked up. I have since then felt that we committed a crime, for I fear we broke into and helped to break down a simple mode of life without any parallel on our busy, skeptical, self-seeking continent.

The family lived almost exclusively on bread and milk. A can of milk covered with a luscious layer of cream was placed before each. Pancakes, so light that they almost tossed themselves, made with no stint of eggs, and occasionally a little fat pork, varied the simple diet. But we wanted butter. In the rich meadows along the Chaudière a herd of their cows fed, and milk and cream there was galore, but butter had never been made, and there was no churn in the house. I recall well how Euphrosyne beat up the rich cream into a substitute for butter in a bowl, using her hand as a beater. It was not nice, and it soon turned sour; but, rather than introduce the innovation of a churn, they preferred buying butter at the store. Besides the cows, they kept sheep, whose fleece supplied the family loom, on which the girls, during the long winter months, wove the *étoffe du pays* for the men's clothing, the striped stuff for their own petticoats, and the blankets for the beds. The fleece was spun at home, after being carded at

the seigneur's mill on shares, for, as a condition of the old seignorial grants, a carding and a flour mill had to be run by these representatives of the old feudal lords, for the convenience of their tenants and their own profit. Then there was a patch of flax, beautiful in the flowering season, and in the autumn the flax-beaters were brought out on the banks of the stream, in whose waters the flax stems had been steeped, and the merry clack, clack of the wooden bar was mingled with the happy laughter of the girls, as they prepared the fibre to be made by themselves into the family linen and sheeting. It was not until the beginning of the eighteenth century that the selfish colonial laws of old France—more exacting even than the commercial laws of England—allowed the Canadian-French *habitant* to begin this self-supporting existence. Ever since then they have added little to the revenue derived either from the customs of his Sacred Majesty of France or the British Crown.

Nevertheless, once in a year there was a trading expedition made by some member of the Deplante family to Quebec. The two-wheeled cart was loaded with a few eggs and turkeys and like salable articles, and with provender for the pony and for one of the boys and one of the girls; and the journey of fifty miles to Quebec and fifty miles back was made by easy stages. Every evening the traders camped by the roadside, and, on the evening before they reached Quebec, stopped just beyond Point Levis, so as to take the earliest ferry-boat and secure a good position in the line of market carts, from which the thrifty housewife still buys on market days her provisions—for the huckster is forbidden to purchase from the farmer until after the householder has had his or her first choice. The few dollars' worth of poultry and maple sugar sold, the important event of the year followed—the expenditure of part of the proceeds in a cotton dress or two, for mass on Sundays; some trifling articles of finery, a little green tea, and some simple remedies. The journey back and the pleasant return home completed the one excitement of the year.

It was a very moral village. With a view to excite early marriages, the boys and girls were encouraged by the priest to meet freely, but at discreet distance. Swinging was the fad, and a huge wooden structure stood before our cottage. The boys might swing the girls, but the lads and the lasses must not swing together. Dancing was not forbidden, but round dances were strictly prohibited. On Sunday afternoon the young men assembled by dozens at our house, each arriving with his own horse and cart, which lined the fence around the meadow between the house and the main road; and then the din of laughter and song, and the dense smoke of acrid, home-grown tobacco, made Sunday afternoon less pleasant to us boarders than to the happy, noisy crowds on the other side of the partition.

The principal personages of the parish were the notary and the priest, but of the two the priest stood supremely highest in the regards of the people. The parish priest of the Province of Quebec is not only the spiritual guide of his parishioners, but the adviser to whom they look for counsel in matters of this world, for medical assistance when the doctor is not nigh, and for consolation in every time of trouble. No clergy in the world stand in as close and intimate relation to their flocks, without being in familiar contact with them, as the French priests of Quebec. The Irish priest is socially even nearer to his people than the Canadian curé, but this very sociability detracts somewhat from his influence and the sacredness in which his person and his office are held. One day the children returned from mass looking almost solemn. A tavern had been opened in the parish against the curé's protest. From the pulpit he had anathematized the tavern-keeper as the destroyer of public morals. He had forbidden his parishioners to patronize the evil den, and threatened that, unless it was closed, he would call down fire from heaven and consume it. His congregation believed in his power to do so, and he, convinced that he was doing heaven's work, believed that heaven would help him.

We were very good friends, the priest and myself. I had given him an Italian copy of one of Raphael's Madonnas for an altarpiece. The last time I saw him was under the following rather peculiar circumstances. It was several years after I had lived in the Deplante family. My father's concession of the gold-field had nearly expired when rumor reached Quebec that a wonderful strike had been made by a company of four *habitants*, who had taken out a license to work on halves. I found the stream on which the rich bar had been discovered alive with gold-seekers; but I found also that, unless I reduced the royalty to a more reasonable proportion, very little would be paid. So I notified the diggers that I would accept one-fourth instead of one-half. Small quantities of gold dust were turned in by stray miners, but the lucky four appeared with two and a half pounds of gold, which they claimed was the result of their work with tin pans in the bed of the stream for ten days. I willingly accepted the gold, and believed their statements. But it soon came to my hearing that the returns they made were far short of their luck, so I cancelled their license. The following day the four men met me, and, as a preliminary, wished an assurance that I would still accept one-fourth instead of demanding one-half. This, of course, I gave, and in the evening they arrived at the hotel with a big mustard-bottle full of dust and nuggets. They had washed a pound of gold for ten consecutive days out of the bed of the stream, and they weighed me out the balance of two and a half pounds.

Not unreasonably, they asked for just a little back, the more so as, in not making a true accounting at first, they assured me they had acted with the consent of the curé. So next day I called on my friend the priest, and received a characteristic explanation. After the extraordinary find, the four *habitants* called on his Reverence, told him the truth, and asked, as a matter of conscience, whether they might not conceal temporarily the full extent of their good fortune, inasmuch as a revelation of such unusual wealth might assist the *concessionaire* in selling to the Yankees, and the Yankees might cancel their license. The advent of the Yankee from this point of view mattered little to the priest, but the Yankee as the embodiment of heresy, vice, and worldliness mattered much to his Reverence, and he fell in with their views, provided they pledged themselves to make ultimately an honest return. But, on my cancelling their license, they returned to the *presbytère* and laid the case again before his Reverence. They said they were willing to pay at once, as the love of the gold might grow on them, and, when the season closed, they might be reluctant to part with it; moreover, they might die suddenly, and what would happen if they passed into the next world with stolen gold in their possession?—a question the priest could not undertake to answer satisfactorily. They thought, therefore, that unless his Reverence objected, they had better ease their conscience and their pockets at once—a holy resolve, to which his Reverence heartily assented. It was with this pleasant incident that I ended my intercourse with the simple, sincere folk of the Chaudière Valley. I have seen it since from the railroad cars, but I fear the railroad has changed the habits of its people more than it has altered the aspects of the country.

J. Douglas.

OLD MASTERS AT THE ROYAL ACADEMY.

London, January 6, 1902.

The Royal Academy once more justifies its existence by the excellence of its winter exhibition. After the two memorial shows by Leighton and Millais, the fine Rembrandt and Van Dyck collections, and last year's unfortunate display of half a century of British art, it has returned to the usual miscellaneous series of Old Masters. There have been winters when the great masterpieces have been more numerous and more remarkable, winters when a wiser restraint has been put upon numbers. Indeed, nothing is gained by the two extra galleries added this year to the usual five. But there are many pictures notable for one reason or another, while there is a special exhibition within the exhibition of paintings and drawings by Claude—the first time, to my knowledge, that due honor has been paid in England to the great French landscape painter.

Of the Claudes I shall speak at length further on. To turn to the rest of the collection is to find that almost all old masters and every school and country are represented, with one astonishing exception—there is no English work, none of the Sir Joshuas and Gainsboroughs, the Constables and Turners, hitherto so prominent. The series begins with a sufficient selection of Italian Primitives to afford employment to the Morellian. Already labels are being juggled with, and new "attributions" made. But really in this section is little to give pleasure to the artist save a small "Virgin and Child with Angels," conventional in design, but very lovely in its harmony of gold and rose, catalogued as a Benozzo Gozzoli, and then immediately handed over to an unknown, unnamed Sienese painter, as if it mattered; and two most beautiful *cassone* fronts by Pesellino—the story of David and Goliath told as naïvely as possible, event succeeding event with no interval in the composition on the long panel, but with a splendor of color, a rhythmical swing in the design, decidedly uncommon in the work of the Primitives. Coming down a little later, the most famous picture included is, per-

haps, the Colonna Raphael, with its well-established pedigree and record of adventure. It is the altarpiece which Raphael painted for the nuns of St. Anthony of Padua at Perugia—an early altarpiece. Sold by them in an hour of need, it passed from owner to owner, from town to town, from country to country, resting for a while in Rome with the Colonna family, whose name ever since has clung to it, until, finally, after having been thought not worth a place in the Louvre and the National Gallery, and not worth looking at while it was sheltered at South Kensington, it has fallen into the hands of Mr. Pierpont Morgan, and in England loud lament is heard because it seems destined, with many another celebrated "old master," to leave Europe for America. But, save for the magic which the name of Raphael still has for the world at large, save for its well-authenticated history, the picture is without great merit. In composition it recalls somewhat the Ansidei Madonna—that seventy thousand pounds blunder of a Liberal Government. The Virgin, holding the Child in her lap, sits on the conventional throne with the correct canopy and elaborate decoration; on either side are arranged the conventional saints in saintly halos and draperies—on the left St. Catherine and St. Peter, on the right St. Rosalia and St. Paul, and, almost in front, the little St. John. They have the pretty insipidity, they pose with the self-consciousness, characteristic of Raphael's saints, and Perugino would have designed for them a more beautiful and spacious landscape as background. Above, in the lunette, is God the Father, with two attendant angels in a Peruginesque group. But the most interesting thing in connection with the picture in its present quarters is the fact that all the panels of the predella (with the exception of one said to have already preceded the picture itself to America) are included in the exhibition—the first time, probably, they have been gathered together since the poor nuns in Perugia had to part with them. But the Academy, with its accustomed unintelligence, has seen fit to leave the panels in the first room, and hang the picture in the third—for no better reason, apparently, than because it is rather against precedent on these occasions to hang both small and large works in the third gallery.

Probably, if the Raphael had been the only picture lent by Mr. Morgan, the outcry over America's gradual acquisition of the old masters would be, for the moment anyway, less loud. But he lends four others—on the choice of three he is not to be congratulated—and it is not so long since every one was talking of his purchase of Gainsborough's "Duchess," which nobody envies him, and the beautiful Fragonard series, which every gallery and museum must want to dispute with him. Of his paintings at the Academy, by far the finest is a landscape by Rembrandt—a wood, the light falling on an open glade in the foreground, and, beyond, the mystery and infinite depths of the forest, little figures disappearing into the shadowy distance; above, a clear sky—a landscape charged with romance. A portrait of the "Cardinal Ferdinand," by Rubens, and a "Lady and Little Girl," by Van Dyck, are fairly characteristic examples, if not the most distinguished of the two great Flemish masters. But I do not think Mr. Pierpont Morgan—or America—is to be congratulated on the Titian, a large Holy Family, as cold in color and commonplace in sentiment as any picture I have ever seen labelled with the name of Titian.

Few other paintings, until the Claudes are reached, need detain one in a general notice of so miscellaneous a gathering. In previous shows I have seen nobler portraits by Rembrandt and Franz Hals, more exquisite examples of Terburg, more sumptuous color by the Venetians. Great names are everywhere in the Catalogue, great work is far more rare on the walls. If I except the sketches for Titian's "Last Supper," painted for Philip II., and now at the Escorial, and for Tintoretto's "Marriage Feast" in the Sacristy of the Salute, Venice; if I except a silvery-gray landscape by Murillo—a surprise, to me at least, because it has such charm and is the only landscape by the Spanish sentimentalist I have seen, but how cheerfully would I exchange it for any number of his Immaculate Conceptions and Assumptions; if I except a blue and white glimpse of Venice by Guardi, a delicate study of tender whites and grays, "Grace Before Meat," by Chardin, and, it may be, a few others here and there, the one picture of any special note is the "Finished Sketch," as it is described in the catalogue, of "Las Meniñas," by Velasquez. Though not, within my memory, exhibited publicly before, the picture is well known. It belongs to Mr. Ralph Bankes of Kingston Lacy, and in reproduction can be seen in the late R. A. M. Stevenson's 'Essay on Velasquez.'

The first thing that strikes one in the composition is the absence of the reflection of the King and Queen in the far mirror. One feels still more keenly the sharpness of detail everywhere, but especially in the pictures on the walls and the upright canvas in the foreground. The figures of the little Infanta, with her maids of honor, her dwarfs and other attendants, and of Velasquez are exactly as in the picture at the Prado, and the central group is put in with something of the breadth and freedom of the master, though the faces do not suggest his touch. But figures and detail are not enveloped in the magical atmosphere that is the beauty of the larger finished work; something has gone from those "fields of vibrating space," that "vast shadowed top" of surely the most wonderful room ever painted. For my part, I believe the "sketch" to be a copy, though I cannot understand why a copyist should have omitted such an important feature as the reflected figures in the mirror. Even as I write, I am assured by a critic who thinks himself an authority and has not yet become a dealer, that it is a copy, probably by Del Mazo, and I fancy most lovers of Velasquez will come to the same conclusion without waiting to hear the critic's arguments.

The Claudes alone would make a delightful exhibition. They are lent by several different owners and collectors. The principal paintings come from the Duke of Westminster, Lady Wantage, the Earl of Yarborough, Sir Frederick Cook, the Marquis of Lansdowne; the drawings, chiefly from the King, Mr. Heseltine, Mr. George Salting, Mr. Knowles, About half the pictures I could willingly have omitted. The others show Claude as the great master he really was. His reputation has been somewhat overshadowed in England by the fame of Turner. Ruskin could not exalt the Englishman of the nineteenth century save at the expense of the Frenchman of the seventeenth. The very fact that Turner himself invited comparison by hanging certain of his landscapes for all time by the side of Claude's, made most people come to the conclusion that Turner must stand the test triumphantly. But he does not, and there are no pictures of Turner's anywhere as perfect as two or three in the present collection. In main features they may be alike. Claude delighted always in wide, rich landscape, in noble groups of trees, stately architecture, tranquil stretches of water, the silver light of noonday, the golden glow of evening. He preferred the well-balanced composition to the bit of Nature chosen at haphazard and copied in all its crudeness. And for this reason his work is sometimes thought cold and conventional and monotonous. But what variety there is, even if motive and material are so often the same! How different the light that falls so serenely on the winding river, the low hills, and distant castle in the "Shepherd Playing on his Pipe," and the golden glow with its dramatic fervor in the splendid "Landscape" from Grosvenor House, though in both it is the hour of sunset! How different the architectural stateliness of one or more "Seaports," and the Watteaulike daintiness and charm of "La Récompense du Village"! And though an unmistakable Claude, where is there anything like "The Enchanted Castle," lent by Lady Wantage, with its exquisite cool light, its tranquil space of sea where the white sails hover, its mountains fading into blue haze against the pale distant sky, its Arcadian peace and calm!

It is not only the variety of Claude that impresses you after a careful study of all these pictures; it is even more their modern feeling and tendency. For a while, he was looked upon as the slave of conventions, one of the powers of evil to be warred with in the general revolt against the academies and traditions. But I think R. A. M. Stevenson was right when he bracketed Claude with Velasquez and Rembrandt as the first of the moderns. He it was who, in landscape, first revealed the true beauty of light. The painter of to-day may have learned much about the scientific qualities and effects of light, but he has seldom understood as well as Claude its serenity, its splendor, its poetry. Claude, again, was artist enough to know that the sun could shine with the same charm on an impressive classical landscape as on the cabbage-patch at his door; he was not afraid of beauty. And as, in that lovely village dance I have just referred to, he seemed to anticipate Watteau, so there are many passages in many pictures to which you may trace the inspiration of Corot and the Romanticists, who, however romantic in name, had the Frenchman's instinctive love of harmony and order, and were unwilling to leave the composition of the simplest landscape to take care of itself. Certainly, I have come away from the Academy convinced not only that Claude was the great master in his own time, but that from his work is derived much that is greatest in modern landscape.

I have seen, perhaps, finer drawings by Claude in Florence. But still, many in the

long series shown are of undoubted interest and value, and the chance to compare them with the pictures for which in some cases they are the notes and suggestions, should prove of immense advantage to the student. They are chiefly in sepia, bistre, and pen-and-ink. Many are sketches of places; of Rome, which he knew so well; of Civita Vecchia and Genoa, which he must have known better than is generally supposed. For at Civita Vecchia, more particularly, the tourist may still see, if he has eyes, the stately piles of architecture, the broad quays, with their curving steps descending to the water's edge, the towers, the tall shipping, the splendor of light in the evening where the channel leads westward, that occur in so many of Claude's pictures of seaports. Other drawings are studies for paintings, always distinguished by the same fine sense of composition and love of graceful form, and sometimes, in arrangement, to the very groups of dancing nymphs, curiously suggestive of Corot. Altogether, I do not remember anywhere a finer exhibition of Claude, and it is fortunate that the Academy, after the horrors it perpetuates in the summer, should, in the winter, give one some reason to be thankful for its existence. N. N.

Correspondence.

GERMAN AND AMERICAN SCHOOLS.

To the Editor of The Nation:

Sir: Without wishing in a general way to deny the soundness of Professor Münsterberg's, and his reviewer's, position in regard to American school education, I should like, with your kind permission, to present a few phases of the subject neglect of which might confirm some of our most earnest critics in their, as it seems to me, rather one-sided view.

First of all, as a matter of fact, the elective system has not become an important feature in the schools of this country below the high school. The so-called introduction of the "kindergarten spirit and methods" into the primary grades has occasionally been carried to excess by well-meaning cranks, but its influence upon primary education has been, on the whole, beneficial, in so far as it has helped to discard many useless formalities and mechanical devices in teaching and discipline. In the primary and grammar grades the pupils are held to prescribed courses of study, and in the high schools the selection of studies is not without restriction. It really amounts to a choice among several courses which, *mutatis mutandis*, differ from each other very much like the curricula in the four or five kinds of secondary schools in Germany. It is doubtful whether a complete separation of pupils pursuing different courses, by assigning to each section a special building and a separate corps of teachers, would be advantageous if it were feasible.

In referring to the superior scholarship of German teachers, one should always bear in mind that the vast majority of German children do not enjoy the instruction of such scholars as constitute the teaching force in the gymnasia and the other secondary schools of a high grade. Among the 85,000 members of the Deutscher Lehrerverein, for example, there are few university graduates. If we could strike the average of scholarship of the teachers of all grades in Germany and compare it with the scholarship of the average American teacher, the advantage would still be on the German side, but there would not appear the wide difference of conditions assumed by Professor Münsterberg. As the American public school combines the various classes of German schools (gymnasium, realschule, etc., down to the volksschule), it is not fair to compare its teaching force with that of the gymnasium alone, which has for generations been enjoying, more than any other institution, the fostering care of the Government. It differs from our high school not only by its more extended course of study, but also by its exclusive function as a fitting school for the University.

Like Professor Münsterberg, I had from my early boyhood none but university graduates for instructors. For two years previous to my entering the gymnasium, I, together with one other boy, was taught by a young theologian taken into the family as a private tutor. I never had any fault to find with him on my own score, and it did not occur to me till many years after that the other boy's nervous system and, to some extent, his life were ruined by that man's pedagogy and the mistaken sense of duty of an ambitious, well-meaning father. The theologian endeavored to pound Latin and Greek into the little fellow, and the father upheld him in the attempt. They had none of the indulgence of American fathers and teachers. (The mother and an aunt entreated the conscientious tutor to desist from using the Spanish reed; he promised, but did not keep his promise.) I have since been able to recall a number of similar cases among my comrades at the gymnasium less fortunate than myself. One boy, I remember, whose case was a hopeless one, left the gymnasium early, after a severe tussle with an irascible teacher. He is now Commerzienrat and the head of one of the largest banking firms in Hanover. That my experience in this respect is not exceptional, and that the present conditions in the German schools, though improved, are not altogether changed, I infer from the reports of others and from the manner in which some recent German novelists have treated the school question. On the other hand, I am firmly convinced, from what I have seen of American "schoolma'ams," that many of them (college graduates, of course, and good scholars in our modest sense of the word) could have taught those boys—who were not dunces—almost anything, not excepting Latin and Greek.

This letter has grown to such length that I must leave it to those of your readers who are interested in the matter to draw their own inferences from the above statements. Allow me only to say, in concluding, that there seems to me good reason for hoping that, as the Germans are gradually transforming their inherited educational system into one of less uniform and rigid requirements, so the people of the United States may evolve out of the as yet somewhat chaotic present conditions a system of popular instruction and education of their own, not yielding in thoroughness and efficiency to any, but superior to all hitherto known in the fuller recognition of the many-sidedness of human nature and of the multiplicity of ways leading to human virtue and happiness. That Professor Münsterberg is contributing his generous share to the realization of such hope, nobody can effectually gainsay.

A. Lodeman.

Ypsilanti, Mich., January 19, 1902.

CHINESE EXCLUSION.

To the Editor of The Nation:

Sir: One would think, to judge by the newspaper press out here, that the whole Pacific Coast was unanimous in favor of Chinese exclusion, but I can assure you that such is not the case by any means. The fact is, the newspapers are pretty much in the hands of the Typographical Union, and it is as much as their going to press is worth to print anything inimical to the so-called cause of Labor; this so-called cause being nothing else than a concerted effort to raise the price of labor and arbitrarily prevent any one else from cutting it. This is legitimate enough if carried on on legitimate lines, but it shows the assurance of its upholders when, as was actually the case the other day in a conference over a labor dispute, they actually have the face to claim from employers the recognition of unionism to the entire exclusion of non-unionism, on the ground that the union enables them to raise wages!

Sentiment from this quarter, like the sentiment of the consumer of high-protection articles, is not voiced much; nevertheless, there is much unspoken protest which will come to a point some day. The salmon-canners are at their wits' end to get Chinese labor, and the serious hampering of this industry is imminent. Then, many farmers and land-owners would be glad to clear up and cultivate what is now waste land, but they cannot possibly do so on the basis of the "high standard of living" that is demanded for the whole working-class. Last, but not least, the humble home-keeper lives in daily terror lest she find herself without help of any kind. White help has always been scarce, but now Chinese is just as much so, and unless an average good Chinese cook can get $35 or so per month, he clears out and goes elsewhere.

What is to be the result it is difficult to see, but there is no question that the Coast is being very much kept back by the scarcity of ordinary labor, and a large-sized vote of thanks will be forthcoming to any agency in the East that will help us to get a fair-sized dose of the "Yellow Peril." W. J. B.

Portland, Oregon, January 20, 1902.

THE ALASKAN BOUNDARY.

To the Editor of The Nation:

Sir: Is it too much to ask that gentlemen who propose to instruct the public as to the meaning and scope of an international treaty shall first inform themselves as to the history and object of that treaty, and shall quote it without omitting essential qualifying clauses? This question is suggested by certain recent correspondence in your columns, especially a letter signed Arthur Johnson in the issue of January 23. The history of the treaty

of St. Petersburg made in 1825 has been fully set forth by the writer in 1889; and more recently, from a study of the unpublished documents, the Hon. John W. Foster has given an account of the negotiations which led up to it, the object insisted upon by Russia and finally conceded by Great Britain, and other details. This statement has not been and cannot successfully be attacked on the score of accuracy and fairness. To this inquirers should be referred, as neither your space nor my time permits of an extended restatement here.

The so-called "claims of Canada" arose from the fact that the exclusion of Great Britain from the sea between Skagway and Port Simpson, which was the effect of the treaty, has become inconvenient to Canada now that the hinterland of the Northwest Territory is being developed. This led some ill-informed individuals to propose an interpretation of the treaty, aided by some obscurity in its terms, which interpretation, to obtain plausibility, requires (1) the total ignoring of the history of the treaty, written and cartographic, and of the mutual action of the parties to it after it had been signed; (2) that, when the treaty says Portland Channel, it must be assumed not to mean Portland Channel; (3) that when the treaty purports to convey a continuous strip of coast *(lisière de côte)* it must be assumed to mean broken patches of coast interrupted by foreign territory; (4) that when the treaty directs that a line shall follow the sinuosities of the coast *(parallèle aux sinuosités de la côte)* it shall be interpreted as meaning that the line shall be drawn disregarding these sinuosities.

What, we may ask, is the value of any treaty if it be subject to such interpretations? I believe I am correct in stating that the British Government has never officially adopted these propositions, though colonial politicians have used them for their own purposes; and, by constant reiteration, it is probable that many well-meaning but ill-informed persons may finally come to believe, in defiance of the real facts, that there is something reasonable and even equitable in these hypothetic interpretations.

In addition to hypotheses, Mr. Johnson is guilty of direct error in several instances when it would be inferred he had the treaty before him. He says that a clause in the treaty "grants to Great Britain the right to 'free navigation' of all these inlets," and asks, "Of what use would this be did she not own their upper reaches?" The truth is that the treaty grants this privilege for a term of ten years. If she "owned the upper reaches" of the inlets, she could hardly have been excluded from them at any time. With regard to the name Portland Channel, or inlet, its history is short, definite, and precise, and the contrary assumption is utterly baseless. Its location and character were settled by Vancouver, who first mapped it, and have never been in doubt since. Mr. Johnson also states that there is a clause in the treaty "which expressly denies prescriptive rights to either party." This is untrue. The only clause which gives even a color of plausibility to such a statement is one in which the contracting parties agree not to make settlements in each other's territory. In pursuance of this, Russia made a settlement on one of the Gravina islands within a few miles of Portland Inlet and the British post of Fort Simpson, and her right to do so was never questioned. When the Hudson Bay Company tried to erect a post surreptitiously on Wrangell Island, they were ignominiously driven away by Russian naval forces.

But, we are asked, why are you not willing to arbitrate this question if the case is so clear? In the first place, we may well wait until these preposterous hypotheses are officially adopted by Great Britain before we consider arbitration as in question at all. Secondly, arbitration, unfortunately for the world's peace, has not of late upheld the ideal character with which it was formerly endowed. The result of the Delagoa Bay arbitration has been fitly described as an international scandal. The United States, secure in the possession of her rights, may well wait until they are attacked in good faith by more redoubtable adversaries than colonial Jingoes.

WM. H. DALL.

WASHINGTON, January 27, 1902.

PURCHASABLE FAME.

TO THE EDITOR OF THE NATION:

SIR: I have just seen the representative of a Boston firm engaged in the publication of a so-called history of one of our universities. He wished me, as a graduate of the university in question, to furnish a sketch of my life and my photograph for reproduction, which, he represented, would be highly desirable to the completeness of the work. The history is to be edited by two well-known graduates, and a long list assured me that many prominent graduates have already furnished similar biographical material. It soon turned out, however, that I was to be included in the great work only if I subscribed to it in two volumes, at $15 each.

The "scheme" is an old one, often used in the publication of county histories and the like, and it can be "worked" anywhere because the essential human vanity is everywhere present. The large scale on which it can be attempted is shown by the announcement of a history of the "One Hundred and Fifty First Families of the United States," admission to which costs fifteen hundred dollars. But it is humiliating to find that such methods can be applied to one of our great universities.

F. C. P.

ITHACA, N. Y., January 25, 1902.

Notes.

Dodd, Mead & Co. will shortly begin publication of a new monthly magazine, the *Bibliographer*, edited by Paul Leicester Ford. It will be freely illustrated with photographic facsimiles of rare books, MSS., etc. During July, August, and September the issue will regularly be suspended. The same publishers announce the second volume of Austin Dobson's 'Miscellanies'; a new volume of Essays by Maurice Maeterlinck; the Autobiography of Sir Walter Besant; and 'Paul Kelver,' a tale by Jerome K. Jerome.

Francis P. Harper will publish next month 'The American Fur Trade and the Far West: A History of the Pioneer Trading-Posts and Early Fur Companies of the Missouri Valley and the Rocky Mountains, and of the Overland Commerce with Santa Fé,' by Capt. Hiram Martin Chittenden.

Mr. Frank Stockton's new novel, in the press of D. Appleton & Co., is entitled 'Kate Bonnet: The Romance of a Pirate's Daughter.'

Ginn & Co. will soon issue 'Analytical Psychology,' by Prof. Lightner Witmer, and 'Northern Europe,' in the *Youth's Companion* series.

'Melomaniacs,' by James Huneker, and Paulsen's 'Immanuel Kant, his Life and Doctrine,' translated by G. E. Creighton and Albert Lefevre, are promised by Charles Scribner's Sons.

The Dodge Publishing Co., No. 40 West Thirteenth Street, have nearly ready 'Favorite Songs of Love,' and 'For Every Music Lover, or How to Know Music,' by Aubertine Woodward Moore.

It is enough to say of 'Who's Who for 1902' (Macmillan) that it is more inclusive of men and women of the time by 200 pages than last year's issue—the present being the fifty-fourth. As is well known, this most convenient directory no longer confines itself to British or Anglo-Saxon personages, but has a universal outlook. Its main value, however, is still British above all. In the American portion we might have expected to find our two governors of dependencies, Gen. Leonard Wood and Gov. Taft.

Mrs. Ady's 'Sacharissa' has needed less than a decade to pass from its second to a third edition (E. P. Dutton & Co.). No revision has apparently been found necessary, and we shall add nothing to our comments on this work offered in 1894. It is handsomely made, and has four historic portraits, beginning with Dorothy Sidney herself, and ending with Algernon Sidney.

Extremely attractive is the little two-volume edition of Bunyan's 'Pilgrim's Progress' bearing George Newnes's London imprint (New York: Scribners). The print is admirably clear, the binding in pliant leather; and Mr. Edmund J. Sullivan's full-page pen designs are often ornamental and generally effective.

In the pocket "Temple Classics" of Dent-Macmillan we have now Perrault's 'Tales of Passed Times,' with twelve illustrations by Charles Robinson, one in color. The series has been eked out from the Prince de Beaumont and from Mme. d'Aulnoy.

Dr. Edward Everett Hale's 'In His Name' has been translated into French by Mary Prince Sauveur, with the author's sanction (New York: William R. Jenkins), and is offered as a text-book for schools.

Sir Richard Burton might well have prayed to be delivered from his friends. The process of publishing the rakings of his desk-drawers goes merrily on; it is called showing respect to his memory, and bringing home to his countrymen what they have lost in him. His memory stands fast, and will stand fast, and his work was well done when he died. But the "literary executors" continue their antics and refuse to let his ashes rest. If the custom spreads, the eighteenth-century Curll will have found successors, and his new terror added to death will be revived. This last instalment, 'Wanderings in Three Continents,' edited by W. H. Wilkins (Dodd, Mead & Co.), consists of some eight lectures and essays, descriptive, in a more or less popu-

lar fashion, of his principal expeditions, which were read before different geographical and scientific societies. They contain nothing which is not more fully and picturesquely given in his previously published books.

The latest of the Yale Bicentennial publications consists of a series of critical and historical essays by members of the Theological Faculty, originally read before the Semitic and Biblical Club ('Biblical and Semitic Studies,' Charles Scribner's Sons). These are average club papers. Among them is a radical article by Professor Curtis on the nature and origin of the tribes of Israel; others are on the growth and development of Israelitish law, oral and written, by Professors Kent and Sanders; on the Old Testament conception of sin as interpreted and developed in Rabbinic literature, by Professor Porter; on the transfiguration, with a good statement of different theories as to it, by Dr. Moulton; on the argument of Stephen's speech in Acts, by Professor Bacon. To these is added, somewhat incongruously, a translation by Professor Torrey of part of the 'Futuh Misr' of Ibn Abd al-Hakam, narrating the Mohammedan conquest of Egypt and North Africa. All of these papers do credit to Yale University, but no one stands out as a peculiarly significant contribution to its subject. It is to be hoped that Professor Torrey is preparing for publication a complete translation of Ibn Abd al-Hakam.

'Old Times in Dixie Land,' by Mrs. Caroline E. Merrick (New York: The Grafton Press), is a discursive account of life in the Southern Confederacy during the war time, by a woman who was to the manor born, and who knew the alternations of prosperity and poverty which constituted the unwritten tragedy of Southern life in those revolutionary days. The story is of varied interest and value. There are many pathetic scenes, and some personalities of original humor in its pages; and there are also frequent excursions into fields of family experience, and moralizings, which are of more concern to personal friends than to the reading public.

"The New Mexico" is described in the *National Geographic Magazine* for January by Mr. John W. Foster, who has just been the guest of the nation. He contrasts the condition of isolation, bankruptcy, and social disorder which prevailed in 1873, when he first went there as United States Minister, with its great prosperity in nearly every respect under the wise and beneficent rule of President Diaz. Its railroad development, the improvement of its ports, the great canal by which the valley of Mexico is drained, the finances, foreign relations, and commerce are particularly dwelt upon. Mr. Foster touches only lightly upon a most important part of his subject, the increasing absorption by citizens of this country of the various manufactures and mining industries, and of large tracts of the most fertile land. Nor does he refer to the growth of an anti-foreign sentiment, which other recent visitors have noticed, and which they hold to be ominous of the future. A number of interesting illustrations accompany the article. We remark also a "Progress Map of Signal-Corps Telegraph Lines and Cables" in the Philippines, on which is every town or hamlet known by the Jesuits or reported to the War Department. No better proof of the activity of the officials of the Signal Office is needed than the fact that, in three years, 7,000 miles of wire has been strung in the islands, penetrating into nearly all corners of the archipelago.

The *Geographical Journal* for January opens with an account of the Uganda protectorate, by Sir Harry Johnston, in which there is much information as to the scattered native races, their origin and language. Among some of these occur curiously varied human types, as, for instance, in the same cluster of Andorobo there will be "hideous little black prognathous dwarfs side by side with handsome youths of almost European features." Sir Harry dwells on the great beauty of part of the land, and especially of the mountain lake Hannington, the haunt of innumerable flamingoes. "Seen from above, they look like a belt which on its outer side is gray-white, then becomes white in the middle, and possesses an inner ring of the most exquisite rose tint. The reason for this is that all the birds on the outer edge of the semicircle are the young in their immature plumage, those in the middle of the belt are full-grown birds that have not acquired the full beauty of the adult, while along the inner edge are old birds in the full beauty of a plumage which ranges from pale blush-pink to scarlet crimson." In his description of the exploration of the Ruwenzori range of snow-mountains, there is a useful summary of the vegetation, in which are some remarkable features, as lobelias twenty feet and more in height, and mosses eighteen inches thick on tree trunks at a height of 12,000 feet. The Rev. Dr. Zwemer tells of three journeys in northern Oman in Arabia, in which he refers to the great civilizing influence of British trade on the fanatical inhabitants of the so-called Pirate Coast. With but a single companion he traversed the coast and crossed the peninsula, being received everywhere with genial hospitality. Col. G. E. Church gives a summary of an exploration of the upper Paraguay, made by order of the Bolivian Government to determine whether it offers a navigable route to the Atlantic. There seems little doubt that steamers drawing three feet of water can ascend the river at all seasons to the Bolivian frontier. The easiest and most direct route, however, is by the Amazon, which Col. Church thinks will eventually take to foreign markets the wonderful natural wealth of the heart of South America. Among the numerous illustrations of this number are some cinematograph pictures of the Severn bore, taken by Dr. Vaughan Cornish.

An interesting discovery is announced by Prof. F. R. von Wieser, in *Petermann's Mitteilungen*, number 12, of a copy of Martin Waldseemüller's world-chart of 1507 in which the name America is first given to the Western Hemisphere, together with a copy of his Carta Marina of 1517, in a private library in Wirtemberg. After describing the charts, of which he is about to publish facsimiles, Prof. von Wieser laments that Waldseemüller's true claim to fame, "the extraordinarily widespread and permanent influence of his chart of 1507 upon the development of the true conception of the world's form," should have been so completely overshadowed by this mere name-giving. Other articles are upon the question, Is Lake Tanganyika a "relict sea"? upon Baratta's earthquake map of Italy, and an inquiry as to the distance at which land is visible at sea.

A large convention of the directors of the so-called "Reform" gymnasiums, also termed the "Frankfort and Altona" system, held in Cassel, was a revelation of the strength of this movement in the German educational world. The leading characteristic of these schools is their "lateinloser Unterbau," and also the innovation that fewer studies are taken in a single year, and these finished if possible. Eighty-four representatives of these institutions were present, of which there are now thirty-seven scattered over Germany, new ones being established every year. The new scheme has been able to compel recognition on all hands. At the Strassburg National Philological Convention, the Rector of the pioneer institution of this kind (that at Frankfort) made an excellent impression by his dispassionate presentation of the "Reform" principles. At the Cassel meeting the Government was for the first time officially represented. The movement has evidently become a fixed fact in secondary-school discipline in Germany.

Modesty almost restrains us from mentioning an article in the London *Publishers' Circular* of January 11, very flattering to the *Nation* as a journal of the class to which it belongs. The praise, however, both precedes and follows a reproach of "anti-English bias" on the political side, seemingly not without some reference to our indisposition to approve of the war in South Africa. This bias, moreover, is detected in our recent review (No. 1904) of Miss Meakin's 'Ribbon of Iron'—an account of the Siberian Railway—in which we alleged aggression on the part of the Chinese in the outbreak at Blagovestchensk on July 14, 1900, for which they suffered so terribly at the hands of the frenzied Russians. But the editor of the *Publishers' Circular* might have read a similar statement in the letter of our special correspondent, Prof. G. Frederick Wright of Oberlin, published in the *Nation* of September 27, 1900, who came upon the scene when the Amur was still "fairly black" with Chinese bodies. He did not justify the slaughter committed by the Russians, but he described the peaceful and harmonious relations existing between the Cossacks and the Chinese up to the moment when the Chinese fort at Aygun "began, without warning, to fire upon passing steamboats," and presently on Blagovestchensk itself; and contended that every appearance argued against Russian intention to disturb those relations.

—Following his series of portraits of women, Mr. Hart begins in the February *Century* a presentation of Stuart's portraits of men. He has chosen for a beginning the portrait of Washington painted by Stuart in Philadelphia, 1795, for William Bingham, Senator from Pennsylvania from 1795 to 1801. Although Stuart made some half-dozen copies from it, Mr. Hart points out that these each show some intentional variation, leaving the original a distinct type, as compared with the commonly known "Stuart Washington." In the paper following Mr. Hart's, and describing a visit to Mount Vernon by the Polish poet Niemcewicz, it is interesting to find the Pole recording in his diary a conversation with Mrs. Washington

on "the small likeness that there is between the General and his portraits." Mr. Daniel H. Burnham of the Commission for the Improvement of Washington city introduces briefly a series of papers on the past and prospective improvements of the capital, giving high credit to the Columbian Exposition for teaching the country the great truth of the need of a comprehensive design and plan for the improvement of cities in their entirety. The first paper is by Charles Moore, clerk of the Senate Committee on the District of Columbia, and its most promising feature is its evidence of the growing tendency of officials in power to do nothing involving the improvement of the city, except on consultation with the commission of experts authorized a year ago, consisting of Daniel H. Burnham, Charles F. McKim, Augustus St. Gaudens, and Frederick Law Olmsted, jr. The tendency to civic improvements elsewhere is represented by papers on the recent alterations in the Chicago River and on the Cathedral of St. John the Divine, in New York. The first subject is treated from the standpoint of utility rather than beauty, but the necessary results of Chicago's new drainage system have removed such a mass of positive ugliness that the contrast may almost deceive one into regarding the present condition as one of positive beauty.

—While the *Century* gives particular attention to the contemplated improvements in the Federal capital, Francis E. Leupp contributes to *Scribner's* a glowing tribute to the picturesque character of the city as it is. He has not only thoroughly "covered the ground," but has even witnessed a Washington sunrise from the summit of the Monument, and his paper is certainly convincing as to the wealth of fragmentary beauty which the new Park Commission is to weld into a harmonious whole. William Jarvis gives a brief account of the young sculptor Paul Troubetzkoy, whose work has attracted much attention during the past decade. The question as to what nation deserves the credit of his work is of considerable interest. He was born at Intra, Lago Maggiore, of a Russian father and an American mother, and is claimed by the Italians, though he has no Italian blood and his characteristics as an artist do not link him with any Italian sculptor. Still further in the line of art, Russell Sturgis gives a brief description of the collection of etchings, lithographs, photographs of paintings and drawings, and miscellaneous prints recently presented to the New York Public Library by Samuel Putnam Avery—in all, 17,775 separate prints, and about 500 books. Important papers of immediate public interest are Mr. Vanderlip's second article on our "Commercial Invasion" of Europe, and a twenty-five-page article on the proposed Isthmian Ship-Canal, profusely illustrated, by William H. Burr of the Canal Commission.

—Though there may be differences of opinion among economists and historians as to the value of a particular interpretation of history, both agree that economic activities play an exceedingly important part in shaping national policy. The most significant example in recent years of how an economic change can affect great national interests is to be found in the development of synthetic indigo. In *Science* (January 3) is to be found an account of a paper read by Arthur C. Green before the Chemical Section of the British Association, at the Glasgow meeting, last summer. Mr. Green gives an accurate account of the present status of the coal-tar industry, and incidentally of the whole chemical industry, which is of interest to us in view of the new trade relations of Germany and the United States. Artificial indigo first saw the light of day as far back as 1870, though the synthesis was really completed only in 1878. For a score of years synthetic indigo was simply a laboratory curiosity; but in 1898, the Badische Anilin und Soda Fabrik brought it on the market, and it was a commercial fact. To-day, Germany has control of the English color industry, is no longer dependent upon England for raw material, and threatens the natural indigo industry, whose destruction would mean a loss to India of nearly $15,000,000 annually. The Baden company alone can produce enough artificial indigo to supply the world's consumption.

—The Indian planters have only begun to bestir themselves. Against the prevailing low prices the only suggestion had been to increase the output; but now they are talking of encouragement to scientific research, and appealing to the Government of Bengal for aid. Some have gone so far as to suggest "Americanizing" the industry by combining the interests in Behar and even in the whole of India. But the army of research chemists engaged in the splendid laboratories of the European coal-tar color factories have a great start on the one or two chemists studying the means of improving the cultivation and manufacture of natural indigo. While scientific methods may be applied to the cultivation and extraction of the indigo-plant, the ever-delicate financial relations of the great dependency and the United Kingdom will be subjected to an additional strain. Mr. Green is convinced that a scientific revival is wanted in England, and that the gloomy condition of the color industry is due to the short-sightedness, ignorance, and want of enterprise of the English manufacturer. The control of the industry has passed into the hands of men who have no knowledge and absolutely no appreciation of the science upon which their business rests, and, concerned only with getting the ultimate amount of present profit, have discouraged all scientific investigations as waste of time and money. Speaking of the establishment of technical schools, Mr. Green is not very confident of their effectiveness "until the public can be completely disabused of the fallacy that a year or two of technical training pumped into an ignorant schoolboy will produce a better works-chemist than a university course of scientific study laid upon the foundation of a good general education."

—'Menelik et Nous,' by Hugues Le Roux (Paris: Lamm), was written at the request of the Negus, who invited the French author to visit Addis-Ababa, and to prepare a volume on Abyssinia after a journey from one end of it to the other accompanied by a small troop of Abyssinians selected from the Emperor's best soldiers to act as guides and escort. Le Roux relates his experiences as political envoy, his observations as an explorer and discoverer of new regions from a geographical and commercial standpoint, his experiences as a hunter, and his sensations as a *romancier*. The book is illustrated from photographs taken by himself on the journey. It is divided into five parts: "The Cross-roads of Aden," "The Route to Addis-Ababa," "Guest of the Emperor," "Toward the Blue Nile," "France and Abyssinia." It describes various audiences, both public and private, with Menelik, gives accounts of life and customs among all classes in Abyssinia, and reports the expedition to a hitherto unexplored part of the Blue Nile, whose course Mr. Le Roux was able to determine definitely. The fifty-two days of caravan were enlivened by elephant hunts, the pursuit of lions, leopards, rhinoceroses, and hippopotamuses, and a brusque encounter with the most savage negroes of Africa. As M. Le Roux was given permission by Menelik to visit the gold mines and placers of the west, his caravan was joined on its way by gold-seekers. Two of these were seized and cut to pieces by the Shankallas, whose chiefs the French explorer led in captivity to the Emperor. The book contains a definite statement of the mining and agricultural resources of Abyssinia, and it closes with these words concerning the future: "It is no prophecy that I place at the end of this volume, but a logical conclusion drawn from facts I have myself observed. Before a railroad is completed from Cairo to the Cape—a highway of ambition and conquest across Africa—there will be a great commercial route offered to the kindly activity of all. From the cross-roads of the Red Sea, its triumphal course will have been opened by Menelik and us."

—In view of the recent death of the Amir of Afghanistan and the political situation which has now developed, the republication of Dr. J. A. Gray's 'At the Court of the Amir: A Narrative' (Macmillan Co.) is certainly timely. Dr. Gray was surgeon to the Amir for some years, and gives in his book a very vivid account of his experiences and impressions at the Afghan court. In it he has used the letters which he had written home, and has made, apparently, little change in them or addition to them. As a consequence, his book has the liveliness of epistolary first-hand, snapshot effects, but has also many trivialities and some most exasperating lacunas. It is evident that Dr. Gray made no systematic attempt to study and understand the Afghans or to enter into their life. He was always dependent upon an interpreter, and to that his troubles, which were many, seem to have been almost entirely due. He was also of a phenomenal uncuriousness when he met anything that he did not at once understand: "I don't know why," occurs again and again. Yet, with all that, the picture which he gives us is of an insistent truthfulness. If he was not a trained Orientalist and could never possibly have become one, he was a trained physician, and saw everything with the precise physician's eye. He had, too, a liking for the registering of little details, and these are so accurate that it is possible for the student of the East to reconstruct from them matters of which Dr. Gray himself, in all probability, never dreamed. On himself and the happenings of his life he lavishes a minuteness and liking which have the true Boswellian charm. The humors of the mediciner-at-large *in partibus infidelium*

were always present with him; he enjoyed them to the full, and his reader cannot help enjoying them with him. The gusto with which he describes makeshift operations and terrific doses is irrepressible. He is evidently a man of great resource and a skilled and experienced physician, and so can afford to tell tales of his own mishaps and failures. His book is entertaining in the highest degree and more than entertaining; but the pity is that he could never bring himself to learn Persian, and so shake free of the whole rabble of interpreters, backbiters, and spies. If he had, the Amir might have been alive to-day, and the Central Asian crisis further in the future.

—Tadamasa Hayashi was the Commissary-General for the Empire of Japan at the Paris Exposition of 1900. He is not to be confounded with the Baron Tadasu Hayashi, who is Minister from Japan to Great Britain; nor yet with Toshio Hayashi, also residing in London. He was the founder of a Paris importing house which, in the hands of his successors, has done much to acquaint Europe with the higher and less-known arts of ancient Japan; but it is some years since he has been actively engaged in that commercial enterprise. It served him, however, to form a great collection of Japanese art treasures; and it was under his direction that was prepared a great folio dealing less with what was shown within the Japanese enclosures of the Exhibition than with the whole field of Japanese cultivation and Japanese thought, as embodied in their plastic and graphic arts. It is, of course, in this book alone that any Oriental or non-European nation has spoken its mind as to its own fine art in any such way that the West could understand it. Here, in decent French, is set forth the view which able and highly instructed Japanese take of their national arts for a period of 1,200 years or more. Its pages are thickly sown with text illustrations, and there are, in addition, about eighty full-page plates, some containing two and some a greater number of separate pieces of fine art. A note to the reader is signed by Mr. Hayashi; and the preface, signed by the Director-General of the Imperial Museums of Japan, Baron Riyuitci Kuki, announces that a man known to European students of the East, Kakuzo Okakura, first planned the work, and that he, abandoning it, turned it over to others, whose names are given in detail; also, that the translation into French has been done by Emmanuel Tranquois. This is a book of permanent rank, a book of reference to which we shall go as to the foundations of anything to be written hereafter on Oriental art. It will be interesting, as time is afforded, to compare the statements of this work with the disagreements among Western writers as to the epoch and as to the relative importance of this and that branch of Japanese fine art.

—In addition to the above-named book, now a year old, we will mention a first volume or first part of an illustrated catalogue describing the collection of Tadamasa Hayashi's collection, which it appears that he is going to sell (or at least the part of it represented by this volume) at auction, in Paris, at the close of the present month. Its nature is, of course, that of a full and very intelligent sale-catalogue, with minute descriptions of the pieces exhibited, and, so far, it would have but a limited interest to those who have not the pieces before them. It contains, however, a large number of photographic plates, representing so many pieces of Japanese art, and of so many different kinds, that these, taken with the full descriptions of the text, easy to find and to compare, will serve as a handbook for the beginner and as a check to the opinions and the conclusions of the more advanced student. Another volume covering the collection of illustrated books is announced, but no date is set for its appearance, nor for the sale of those objects.

FURNESS'S TWELFTH NIGHT.

A New Variorum Edition of Shakspere. Edited by Horace Howard Furness. Vol. XIII. Twelfth Night. Philadelphia: Lippincott.

The thirteenth volume of Dr. Furness's great Variorum lies before us, and a delightful book it is. "Twelfth Night," to be sure, is "good enough without notes," but notes are necessary evils, and the history of Shaksperian annotation has almost become a specialty by itself. Variorums we must have, and Shakspere grammars and lexicons, and treatises on "metric"; nor are we ready to join the cry of those who jeer at commentators. The dullest of them may stumble upon an idea, and there is still much in these dramas which resists explanation. When the whole body of pertinent and impertinent scholia is collected and sifted and set forth by a scholar of Dr. Furness's learning and accomplishments, it might seem only becoming to accept the gift in reverential gratitude, acknowledge it courteously, and say no more. But every fresh volume of this series tempts to extended comment. The mere toil of the editor, prodigious as it is, is the smallest part of the wonder. The skill with which he arranges his unwieldy material seems to increase with every year, and—more admirable still—his spirits never flag. The present volume is not merely a record of what his predecessors have done, or failed to do; it is full of original contributions, varying in their value with the circumstances, but joyous to read, and instinct with the keenest appreciation of Shakspere. Clearly it has been a constant delight to Dr. Furness to edit "Twelfth Night," and he permits his readers to share his pleasure. We are in the presence of an uncommon phenomenon—a Variorum that exhilarates.

Dr. Furness is resolutely consistent in his gentle scorn for those who care to determine the dates of Shakspere's plays. All or most of his prefaces give utterance to this feeling. "We who have free souls," he says, "and, *as far as the plays themselves are concerned,* care as little for the hour when Shakspere wrote them as for the quality of his ink. . . ." This is going pretty far. But, after all, the words that we have italicized imply a virtual abandonment of the extreme position. "As far as the plays themselves are concerned," quotha? Let it read "as far as the individual play," and one may give (craftily qualified) assent. We have all been worried by those Shaksperian chronologists who insist on times and seasons to the exclusion of everything else—who will not suffer us to read "Hamlet" or "Henry IV." without obtruding upon us a cumbrous machinery of groups and periods. Yet surely it is also admissible to contemplate the dramas as a kind of whole—as the *work* of Shakspere no less than as his *works;* and for such study the consideration of dates is indispensable. Dr. Furness apologizes for the repetition necessitated by his plan of making each volume complete in itself. It is not to be avoided, for the most part, but no one would object to his omitting, in subsequent volumes, this particular bit of personal opinion. There is good sound doctrine in Romans xiv. 3, and it is not limited to sacrificial scruples.

The text of "Twelfth Night" is unusually free from corruption. So accurate is it, indeed, that Dr. Furness, discharged from the duty of registering countless quarto variants, draws a long breath, and expresses his satisfaction at the absence of all authorities save the First Folio. On another occasion we have adverted to the increasing conservatism, in this matter of text, that has marked successive volumes of the 'New Variorum.' In "Othello," published in 1886, Dr. Furness abandoned his plan of constituting a text, and reprinted the Folio letter for letter, eloquently justifying his procedure in his preface. Since the *apparatus criticus* is always before the reader's eye, and since the editor expresses his own opinion whenever a doubtful reading occurs, no objection can be urged to his method, and it has obvious advantages for such an edition. Occasionally, however, Dr. Furness carries his respect for the venerable too far, and defends a manifest error. In the present volume—though there is still a prefatory fling at the quartos, delicately put, but showing that he regards them as vicious intromitters—we detect a slightly lessened regard for the Folio, in healthy reaction from a too exclusive reverence. The druidic mist that enshrouds the "true original copies" of Heminge and Condell's title-page covers a multitude of their sins. Folio-worship is a form of religion that is not quite free from superstitious taint. Among the Baconians, indeed, it has grown to be a kind of melancholy madness.

The care which Dr. Furness has bestowed on the text, despite the fact that he has chosen to reprint the Folio, is shown in a thousand places. A striking example is his commendation of Capell's "excellent comma" (p. 168)—excellent indeed, and too seldom heeded; Dr. Furness is the first editor to do justice to Capell. He even suggests emendations himself. A tempting one is the transference of a speech (p. 171) from Sir Toby to Sir Andrew, whose "weak treble" one seems to recognize—"and yet we know not." On the other hand, a subtle but inconclusive defence of the Folio may be seen at p. 186, where it is a question between *and* and *not.* Another instance of excessive faith in the Folio is the defence of "with adorations, fertile tears" as a complete verse, with an appeal to the overworked doctrine of the "pause that makes up to the ear for the loss of a metric foot." Whatever may be said of this doctrine in the main, the present passage, with its lyrical richness, is no place for its application. Pope's emendation *"with* fertile tears" is not only a metrical necessity; it is stylistically inevitable, and will keep its place in defiance of even Dr. Furness's persuasive note. On the other hand, Theo-

bald's unnecessary (though not improbable) emendation of *out* for *on't* (p. 232) is approved as something "demanded." It is hard indeed to hold the balance in such cases. Be it remembered, however, that in general Dr. Furness has an uncommonly steady hand.

Some of the editor's remarks are extremely subtle. "Unless the master were the man" (p. 92) gives occasion to one of these, which is so pretty that we dismiss it with great reluctance in favor of the more obvious interpretation. A felicitous gloss, and certainly correct, is that on "gives a very echo to the seat where love is thron'd" (p. 138). *Per contra*, the point of Sir Andrew's "Jezebel," applied to Malvolio, is lost (p. 161). For *reader*, in the last line of the notes but one, read *writer*. This is not a misprint, but an injustice; let it be rectified, if the heavens fall or the plates have to be cut. Now and then, Dr. Furness's humor will puzzle foreigners, who may take it in dead earnest—as where he says that "*firago* seems far more expressive than the tame *virago;* there is in it a suggestion of *fire, fury, fiend, ferocious*, all combined" (p. 240).

It is impossible to criticise the work in detail, nor is such criticism required. A few matters in which we disagree with the editor, or in which we detect slight omissions, may now be specified. Most of them are trifles, and, were they all important, they would count for nothing in comparison with the excellence of the whole. Sir Toby's song, "O the twelfe day of December," is still left unidentified. Is it not, in all probability, the historical ballad of "Musselburgh Field," preserved in the Percy MS., and beginning—

"On the tenth day of December,
And the fourth yeere of King Edwards raigne"?

In the note on *ay-word* and *nay-word* (p. 129) we miss a reference to Dr. C. P. G. Scott's admirable monograph. The miss is more seriously felt in the case of *cockney* (p. 251). Grey's note (p. 152) which restricts to poisoners the punishment of boiling to death, is quoted with approval, but it is incomplete; there is much lore on the subject collected by Robertson in his 'Materials for the History of Thomas Becket.' On "Jolly Robin" (p. 266) a quotation from Chaucer's "Troilus" would have been in order, and a reference to Professor Flügel's 'Neuenglisches Lesebuch' would have cleared up the subject still farther. It is not quite certain that *jig* is from *giga*, "a sort of fiddle" (p. 51). "*But* . . . in its original meaning, namely, *out-take*, or *except*" (p. 77) seems to imply a misapprehension of the history of the word, but the reference to Abbott's 'Shakespearean Grammar' mends matters. How *a*, for *he*, could be "reduced to a mere aspirate" is not quite obvious (p. 77). The suggestion that to "our American minds" a squash "can be only a large melon" will certainly disturb Dr. Furness's agricultural readers. Boys who steal squashes thinking them melons are immemorial objects of rural wit. Is "a *dry* jest" a "stupid" one (p. 42)? Hardly; any more than "a dry blow" is a dull stroke. At p. 62 a reference would have been in place: "Montaigne has two stories" is pretty vague. We venture to doubt the supposed pun on collars and colors (p. 61), though asserted with "of course" by no less an authority than Dr. Aldis Wright and backed with a reference by Dr. Furness. One wonders to see the editor objecting tautology to the usual and inevitable explanation of "Good my mouse of virtue" (p. 68)—as if idiom and humor shuddered at tautology (a word to conjure with!). Dr. Furness's perception of Shakspere's humor is extremely delicate, but here it seems to be at fault. One passage, which Dr. Furness calls "dark," is not hard: "Words are very rascals since bonds disgraced them." In the old days, a man's *word* was as good as his bond—or, rather, a *word* was sufficient, and hence *bonds* were never heard of. The introduction of *bonds*, then, was a plain discrediting of *words*. It is odd that Dr. Furness should have missed this; the notes that he prints are truly, as he himself declares, far from illuminating, and his own suggestion will hardly meet with acceptance.

But enough of this. It is small business and may seem ungracious. We yield to none in our admiration for Dr. Furness's achievement. Our "excepts before excepted" must be taken merely as a proof of the interest with which we have read the volume. May there soon be another!

SOUTH CAROLINA IN THE REVOLUTION.

The History of South Carolina in the Revolution, 1775-1780. By Edward McCrady. Macmillan. 1901. Pp. xxxiii, 899.

The third volume of Mr. McCrady's elaborate history, our notice of which has been far too long delayed, is chiefly remarkable, aside from its detailed account of military operations, for its exposition of the attitude of South Carolina towards the mother country during the Revolution, and of the slow and reluctant growth of the idea of independence. To the majority of South Carolinians, vigorous resistance to the course of Great Britain not only did not mean political separation, but did not for a long time preclude the possibility of reconciliation. The "Association" organized by the Provincial Congress in June, 1775, became practically a revolutionary Government, and, through a system of committees with indefinite powers, began an aggressive enforcement of the agreement. The address of the Congress to the new Governor, Lord William Campbell, a few days later, declared the desire of the people for reconciliation, though preparations for military defence continued, and consignments of powder were seized. But the power of the general committee to punish non-subscribers to the Association "according to sound policy" was soon arbitrarily exercised, with the result of replacing the despotism of King and Parliament by the despotism of a self-appointed committee, representing but a small fraction of the people of the province, with no support in the interior, and with the opposition of many of the most prominent and influential men of Charleston and the low country.

The Council itself was divided into moderates and extremists, the one hopeful of reconciliation, the other bent upon war. The Germans in the interior, with little knowledge of the merits or facts of the dispute with England, living a freer life than they had ever enjoyed before, and, having no use for either stamps or tea, were not disposed to join the Revolutionary party; and the same sentiment obtained among the Scotch Presbyterians. The merchants and planters in Charleston were as a rule opposed to war. But although the grievances of South Carolina were different in character from those of Massachusetts, and different, also, in onerousness, the radical leaders, like Drayton, Middleton, and Gadsden, pushed with vigor and address the advantage already gained, took possession of the political machinery, and did their utmost to force the colony into war. In September the Governor, whose prompt action at the beginning might have defeated the movement, withdrew to a sloop-of-war in the harbor, provincial troops took possession of Fort Johnson, and Charleston was fortified. How far the movement was from representing any majority of opinion was shown by the numerous acts of violence perpetrated by the Revolutionary party, and the narrow majorities by which its measures were passed. A military demonstration in the back-country brought on, in November, the first bloodshed, and the opposition in that section was ruthlessly put down.

The same general feeling of regard for England which denied popular support to these proceedings, made the idea of independence also of slow growth. When Gadsden declared for it, in February, 1776, the declaration came, as Drayton expressed it later, like an explosion of thunder to the members of the Provincial Congress who heard it, and called forth a warm reproof from John Rutledge, who asserted his willingness "to ride post by day and night to Philadelphia, to assist in reuniting Great Britain and America" (p. 109). Even the resolution for the establishment of an independent government was carried by a House in which less than two-fifths of the members, apparently, were present, while the fact that the proposed government did not represent the whole province, but only the low country, made its influence divisive. The choice of John Rutledge for President—as the official who replaced the old Governor was now to be called—was most fortunate, his natural conservatism and firm stand against separation from England enabling him to act as a bulwark for the people against the precipitate conduct of the radical leaders. A little later, Chief Justice Drayton, in his charge to the grand jury at Charleston, followed Gadsden's example, and declared for independence, but neither his indictment of Great Britain nor his argument in support of it was such as to appeal strongly to the people of South Carolina. In his bill of grievances, as Mr. McCrady says:

"There was nothing which particularly affected their colony but the general charge that Parliament claimed the right to bind the colonies in all cases whatsoever. And in regard to this, no one in South Carolina, not even Gadsden, had ever denied its right to bind them, except in the matter of taxation. . . . Then, in the matter of taxation, it was open to the friends of the royal Government to refer the Chief Justice to his own *Letters of Freemen*, in 1769, in which he had strenuously maintained this right of Parliament in that particular. . . . It is singular, too, that, in justifying the great step, the Chief Justice does not allude to the real grievances of this colony. He does not point out how the native colonists had been superseded and set aside by the officials of the Board of Trade for the placemen who hung around the throne for recognition and reward for questionable service rendered. He does not point out to the people of the Up Country

that it was the wilful neglect and corrupt conduct of that Board in England which had deprived them of courts for the punishment of crime and the maintenance of justice. . . . In the stead of all this, he appeals to them to declare themselves independent of England because New England's fishing trade had been interfered with, and because the Legislature of New York had been suspended, the charter of Massachusetts altered, and the Roman Catholic religion recognized in Quebec. But what had the Scotch-Irish Presbyterians who, with the Bible containing their own version of the Psalms, were enjoying the liberty of conscience in the country they were wresting from the Indians, to do with all that? Were they, for the sake of the New England fishermen and the Canadian Protestants, to go into a war and expose themselves to the inroads of the Indians, and to set up a government on the coast which was not yet prepared to abandon the Church of England as a church of State? . . . The Chief Justice had nothing to say to the people of the Up Country, explaining why they should fight for representation in the Parliament in England at the bidding of a body in which they had had no representation at home" (pp. 119-122).

With South Carolina, as with the country at large, it was the logic of events rather than of argument that urged the colonies to independence. Yet even here the reluctance of South Carolina was strikingly exhibited. The representatives of the State in Congress signed the Declaration "with grave misgivings" (p. 175). Not until July 9 did they write to President Rutledge, and even then they referred to the matter only incidentally. Their reluctance but reflected the hesitation and uncertainty at home, where there were few families in the low country but were divided on the question. The same reluctance to admit independence as final, while still resisting the coercive policy of the Crown, was strong in 1778, when the terms offered by the peace commissioners would, Mr. McCrady thinks, have been gladly accepted by a majority of the people of the State.

Upon the rejection by Congress of the offer of conciliation, and the departure of the commissioners in November, 1778, the British moved upon the South. The flourishing trade of South Carolina and Georgia favored by the interval of peace, the active commerce with France and consequent opposition to the French alliance, the importance of Charleston as "the storehouse of merchandise and the retreat of privateers," combined to make these States an inviting object of attack, while the remoteness of the region from the previous centre of hostilities, and in particular the defenceless condition of Georgia, promised an easy victory. The military operations that followed are traced by Mr. McCrady in great detail and with not a little adverse criticism. He points out that, from the beginning of the war, the prevailing military theory had intrusted the defence of the country to a regular army, notwithstanding that a regular army was one of the institutions which the colonies generally feared; and the consequent neglect of the militia left without defence any section in which a sufficient force of Continental troops could not be maintained. Moreover, although the regular army was open to all who would probably have served in the militia—a point to which we think Mr. McCrady does not give sufficient weight—the service soon deteriorated, and the ranks came to be mainly filled, not with patriots such as those who fought at Bunker Hill, but with hired soldiers who fought for pay, and who often served as readily under British as under American commanders. Mr. McCrady has no condemnation for Washington, but he points out that when, in May, 1779, Washington declared to Gouverneur Morris his inability to respond to calls for help from "particular States" without sacrificing "the most obvious principles of military prosperity," South Carolina was left to take care of itself; and it did in fact meet the British attack mainly with its own forces.

The conspicuous fact about the British operations in South Carolina was their success. The sentiment of Charleston was shown during the first siege, when it sought neutrality for the remainder of the war. The capture of the town was shortly followed by the submission of virtually the entire State. In June, 1780, "there was not a Continental officer or soldier in the field." Clinton wrote to Lord George Germain, "I may venture to assert that there are few men in South Carolina who are not either our prisoners or in arms with us" (p. 533). The revolutionary party was broken up, and only John Rutledge remained, clothed with full powers to keep alive, if only in his own person, the State Government. "There can be little doubt," says Mr. McCrady, "that at this time wise rulers might, with care and moderation, have reëstablished the royal authority," and reconciled South Carolina to the Crown (p. 535).

The widespread belief "that in order to secure the independence of the others Congress had determined to sacrifice the Southern States," was a further powerful inducement to submission. Mr. McCrady seems to be convinced that the belief was well founded, and that the resolution of Congress denouncing the report as "insidious and utterly void of foundation" was a case of protesting too much; and he further adduces the testimony of Luzerne and Duane. The time was unquestionably a critical one, but the conduct of Clinton, Cornwallis, and Lord Rawdon proved ultimately to be the salvation of the Union so far as the South was concerned. When Clinton, in June, 1780, issued his proclamation, restoring to all the rights and duties of citizens and inhabitants such of the people of the province as were prisoners on parole, but declaring that all such persons "who should afterward neglect to return to their allegiance and a due submission to his Majesty's Government should be considered as enemies and rebels to the same, and be treated accordingly" (p. 554), he fixed the turning-point in the contest. The cruelties of Tarleton and the outrageous conduct of the British troops were not easily to be forgotten, while the attack upon the Scotch-Irish, who heretofore had taken no active part in the war, "converted the neutrals in the State into . . . implacable enemies." And, with the war spirit no longer confined to a class, but animating the whole people, the "heroic period," as Mr. McCrady calls it, began.

We have no space to follow Mr. McCrady through the four hundred pages in which he traces, with minute detail, the first months of the partisan warfare that ensued. No other writer has examined this phase of the Revolution with such painstaking care, or shown so clearly the place in the struggle of the new leaders who come upon the field. The narrative ends with 1780, the remaining years of the Revolutionary period being reserved for a fourth volume. The emphasis which is put in the present volume on the services of Marion, Sumter, and the other popular military leaders, and the intimation in the closing paragraph that the treatment of Greene's career will not be entirely in the spirit of eulogy, makes us hope that the remainder of the story which Mr. McCrady is telling with such spirit and success may soon be made public.

THE MUSICAL BASIS OF VERSE.

The Musical Basis of Verse. By J. P. Dabney. Longmans, Green & Co.

The title of this book is somewhat misleading; we expect to read a succinct monograph on those features of music which underlie the structure of verse, whereas we find a discursive treatise upon poetry in general. A great deal indeed is said about music, but it is rather the enthusiastic assertion of the author's belief in its basic relation to verse than any cogent proof that such an affinity exists. Still less is anywhere definitely expounded the nature and extent of the relationship between the two kindred arts.

Hitherto no satisfactory book on poetics has appeared in English. They have variously exhibited grave defects—imperfect grasp of the subject, incomplete analysis, disregard of previous investigations, hasty composition, unsystematic presentation, or, worst of all, a false and pretentious affectation of system. Those most recently published have generally labored under the incubus of a preconceived idea, and have striven to wrench from the facts a confirmation of a beloved hypothesis rather than to build up a theory out of usages of verse writers. Most have altogether exaggerated the importance of musical knowledge as an aid in explaining the difficulties of English versification. Many have wasted much space and effort in a tedious application of the historical method where it is not at all needed.

This fresh attempt we took up with much interest, but do not find it in any respect an improvement upon its forerunners. Each and all of the faults of its predecessors might be found in it by meticulous criticism, such as we do not propose; and other grave defects are manifest to the most cursory perusal. The bulk of the book is made up of examples culled from the poets, and of passages quoted from the critics; an astonishingly small proportion of the matter is in the author's own words. This in itself is not necessarily a weakness; but, in the excerpts as well as in her own utterances, the author seems often if not usually to mistake assertion for argument, and asseveration for demonstration. See, for instance, the footnote on page 81, and the second paragraph of page 52. In the footnote we are told "I have shown": on page 52 we find the merest implication, not even a clear statement. The same matter is referred to on page 77, but with the airiest assumption in place of proof. What the author wishes regarded as true, is accepted unhesitatingly; and what does not appeal to her, is cavalierly dismissed.

The first chapter, on the relation between music and verse, extends to fifteen pages. It may be summed up in one of its own sentences: "If we glance down the vistas of history and examine the evidences, we shall perceive one fact, that the two

arts of music and poetry have always waxed and waned together." It hardly needs so much space to set this forth, and it seems quite obvious that all arts together flourish amid fostering circumstances, and languish under unfavorable conditions.

The second chapter offers a system of notation for scanning verse. Some of the characters used in writing music are employed to denote the syllables of poetry. Here, if anywhere in the book, we expect the justification of its title, and do not find it. What we find is almost precisely the system of scansion used by Schmidt in his well-known 'Rhythmik und Metrik,' the English translation of which is readily accessible to any one. The crotchets and quavers which the author uses are clumsier than the familiar long and short marks of the classic scansion—they take up more room; but it is impossible to discover any difference in their meaning, or anything recommending them over the customary characters. It is a pity that each new writer on versification finds it necessary to invent a new system of notation and terminology. It would seem that even a hasty examination of existing works must save a great deal of mental exertion. The author appears to have thought out, individually, a system practically identical with Schmidt's, in the ideas it sets forth, and manifestly inferior to it in the notation used to express them.

Again, in the same chapter, we find a new terminology. The terms "rising" and "falling" as applied to rhythm are fairly well established, and are used by most writers on the subject. What is there to gain by calling the rising measures "strict," the falling measures "with direct attack," and those wavering between the two, or hard to assign to either, "free," as is done on page 47? The tendency to elaborate a new nomenclature and terminology appears very often throughout the book, and seems a source of confusion rather than of clearness. Especially do we fail to perceive what is gained by denoting as "primary rhythm" what Sidney Lanier (in his 'Science of English Verse,' pages 71, 77) calls "secondary rhythm." It would seem that the terms used by an admired pioneer ought to suit an enthusiastic disciple. Considering the matter for ourselves, it appears to us that Lanier's terms are far better than this author's innovation.

The remaining chapters are so unsystematic that no detailed criticism is possible. The author sets out, to all appearance, to weigh and value the metrical structure of a quotation or of a poem. The upshot often is the praise of poor metrification because of the excellent presentation of the subject, or because of beauties in the imagery. Quite often really good lines are condemned because of the defects, not of the verse structure, but of the matter or diction. The word "vibration" is abused throughout the book to a painful degree (see pages 17, 59, 61, 63, 88, 95, 97, 98, 133, 242). Some of the judgments put forth seem risky, to say the least; some very individual, some one-sided. For instance:

"Wordsworth, too, though in a very much less degree, was defective of ear" (p. 53).

"Neither Wordsworth, Coleridge, nor Emerson was a metric artist of a high order" (p. 71).

"We perceive this to be the favorite metre of Scott, Byron, Wordsworth, and others, which was mentioned on page 70 as being monotonous and without much motion" (p. 151).

Such utterances as these shake one's faith in the author's capacity for the task attempted, and make implicit confidence in the book's conclusions quite impossible.

If we grant for the time being the assumptions upon which rests the system of scansion used by the author, we find that it is applied for the most part consistently, and that the passages it undertakes to analyze are mostly well understood in respect to their movement when considered as verse. The notation, too, expresses the author's ideas fairly well. Some of the excerpts, however, are manifestly miscomprehended, and the system is mercilessly applied as a Procrustean bed to those which, using the author's own nomenclature, begin in a 3-beat rhythm and change to a 2-beat rhythm later. The author denies that this ever occurs, and relentlessly scans uniformly a quotation from "Christabel" (p. 42) and Shakspere's "Come away, come away, death" (p. 45).

Enough of strictures; the book is certainly a failure, but we honor its aim. While no good manual on this subject exists, praise is assuredly due to any one who attempts what is plainly a desideratum. Although we feel that this volume cannot serve as a safe guide for ambitious beginners, striving to learn how to write English verse, cannot make for itself a place as a book of reference for mature students of English poetry; although we believe it may in some cases balk and mislead callow aspirants for the poet's bays, befog and becloud earnest searchers after the verities of English versification, yet we find more good in the book's purpose than evil in its execution. It can neither direct the student nor illuminate the scholar; still, it can hardly fail to stimulate either. In reading it, we feel continually baffled by the shapeless jumble of snap-judgments, unsupported statements, and undeveloped quotations. The constantly recurring criticism of the poetic quality rather than of the versification in the excerpts from the poets is irritating. Yet the book, indirectly rather than directly, stimulates a reader to further thought. The author fails to grasp her subject fully, to express what she grasps, or to set forth the musical basis of verse, is loose and vague to a degree, fails to convince, to comprehend what she feels, but (and here is the saving clause), while there is an astonishing amount of miscomprehension in the book, there is an amazing amount of right feeling. Hardly any one will need this book on oft-sought shelves; almost anybody at all interested in the subject will be the better for one perusal.

The book has a good index.

Hypolympia; or, The Gods in the Island: An Ironic Fantasy. By Edmund Gosse. Dodd, Mead & Co. 1901.

Mr. Gosse's 'Hypolympia' is a graceful piece of high-toned foolery. The sources of his inspiration, and the tradition which has been his guidance, are not far to seek. Heine's 'Gods in Exile,' the Dialogues of Leopardi, Dr. Garnett's 'The Twilight of the Gods,' Pater's 'Apollo in Picardy,' are some of the literature of which one is reminded in reading 'Hypolympia.' The likeness, however, is never very close. Mr. Gosse rarely approaches either the satiric pungency or the poetic beauty of his masters. But his work is none the less admirable in its kind; the prose is graceful, the verse melodious, the irony pleasant and timely, and the difficult tone of ironic fantasy well sustained.

The fable is the old one of the wandering of the Olympian deities after the *Götterdämmerung* in the South. The scene is "an island, hitherto inhabited by Lutherans, in a remote but temperate province of Northern Europe." The time is early in the twentieth century. The scene opens upon the entrance of Aphrodite, out of breath, in her new mortality, and Eros. They are anxious and distressed, and but little comforted by Pallas, who, entering later, seeks to hearten them by a sight of the strange opal-like jewel of Pandora, which has been commended to her by the oracles as a charm against the woes of Olympus. Pallas herself is quite content and calm, for, as goddess of wisdom, she ponders on the vicissitude of things, and so is enabled to be herself even on a "beechwood peak in the cold sea." To them enters Zeus, perhaps the best conceived of all the dramatis personæ. The nerves of the Cloud-compeller are unstrung, and he is in a mood of garrulous irritability. After Zeus, the other gods appear upon the scene one by one, quite to the end of the pageant.

The action of the piece from this point is too fantastical and various to be retold. The special ironic manner which Mr. Gosse has adopted is nowhere seen to better advantage than in the conversation between Phœbus and Pan. Phœbus is the poet and idealist of the party on the island, and, for the most part, talks verse; but, in his interview with Pan, a very materialistically minded person, he talks good prose. The conversation is concluded by Phœbus, who is made to remark pregnantly: "I congratulate you, Pan, upon your temperament, and I recommend to you a further pursuit of the attainable." Another notable episode is that in which Zeus is made to pose as a fatuous patron and critic of modern poetry, and the current vein of poetic "symbolism" delightfully derided.

The nodus of the fantasy, in so far as it exhibits such a thing, consists in the slow reconcilement of the deities to their mortal condition. This end is furthered by the subtle influence of Pandora's opal-like jewel, which creates in them a mood of "wistful cheerfulness." But the chief agency is the philosophical admonitions of Æsculapius, who points out that mortality is really the root of true pleasure, that without the chance of satiety there can be no satisfaction, that the art of right living is "to keep the supports and alleviations of your labor about you as skilfully as you can, and, in the fuss and business of the little episodes of climbing, to forget as long and as fully as may be the final and absolutely unavoidable plunge." So successful is Æsculapius that at last even Nike cries out: "Ah! I see, I think I partly see. The element of real victory was absent where no defeat could be. . . . And it may be present even where no final conquest can ensue."

So far Mr. Gosse differs from most others who have handled the theme, in making his fantasy tend toward optimism. But at the very last he goes back to the tradition, and so enforces his irony. Suddenly Iris ap-

pears with miraculous ships to convey the gods and goddesses back to their earlier home and their immortality. They forget their newly acquired philosophy, and, with Olympian jubilation, prepare to embark. Just as they go off, it is discovered that Hermes has given away, to a mortal maid, the opal-like jewel, the begetter of "wistful cheeriness." But Pallas assures them: "It is of no moment. It would be an inconspicuous ornament in that blaze of the heart's beauty to which the white ships are about to carry us."

It will be seen that, while the conception of the work is light and fantastical, it is not devoid of serious criticism of life. It contains, of course, nothing conclusive, but it will furnish reading stimulating as well as pleasant to one wth a taste for the peculiar *genre*.

Old-Time Gardens, Newly Set Forth. By Alice Morse Earle. A Book of the Sweet o' the Year. Pp. xviii, 489. 204 illustrations. The Macmillan Co. 1901.

What a pleasant surprise to some people must be this book about 'Old-Time Gardens.' Many had expected to find in it a superabundance of sentiment falling into sentimentality. Some had looked for a book made, as it were, to order and with an evident effort; some for little real knowledge and the lack of it none too well concealed. A half hour's reading is enough to convince the most skeptical that it has none of these failings. Sentiment it has, to be sure, but this is kept well within bounds, as if there were somewhere in the author's mind a sense of humor sure to give warning before the brink of sentimentality was reached. Knowledge there is, and of a very real kind—knowledge that has been many years agrowing, consciously and unconsciously. And as for the book's being made to order, it comes straight from the heart, and from a kindly heart at that. Mrs. Earle had the good fortune as a child to pass her summers in an old-time garden. There she laid in great store of knowledge of the ways of children among flowers, a store that she is now able to draw upon at will and in most delightful fashion, so that one of her best chapters is about childhood in a garden. Her forebears, too, for generations, seem to have been garden-lovers, so that her sympathy with growing things may well be an inherited trait. Her love of gardens and the interest in colonial life and manners which her earlier books have manifested, are in this one most fortunately joined, so that she has here given us a fund of information about the old-time American garden and the things that grew in it, the like of which cannot be found elsewhere.

The real colonial garden that has been well maintained, and has come down to us without change from the days before the Revolution, is a hard thing to find. A few exist, but for the most part our old gardens, notably those of the South, have been permitted to fall into decay and have lost their former charm of primness. Others have been so changed by "landscape artists," ignorant of the laws that governed their planning and out of sympathy with their well-ordered reticence, that their original form may hardly be discovered. Of such as are left in a condition reminiscent of their best time, Mrs. Earle has succeeded in finding the best. Photographs and descriptions of them she gives us; but the thing that lent them their distinctive character—their plan—is missing. Sketches of such plans, even though small and rough, would have made all clearer than many words. Here and there, however, the plan is so clearly defined by neatly trimmed box-edging that the photograph serves in place of a plan.

But it is not on the side of garden design that Mrs. Earle shows her strength and knowledge. They appear when she speaks of flowers. With them she is at home, and about them she discourses in a pleasant way that puts the reader on good terms with himself. With flowers old and new the book is chiefly concerned, and some of its most entertaining parts deal with the introduction of our garden favorites into this country. What flowers the Dutch brought with them, what the Swedes, and what the Pilgrim Fathers—such things are curiously sought out from ancient sources and here set down with minuteness and fidelity. To convey an idea of the exact scope of the book is not easy, but some nction of its varied contents may be had from the fact that its twenty-two chapters cover subjects as widely separated as front door-yards, the gardens of the poets, sun-dials, and the herb garden.

Country Life and *House and Garden* have set such a high standard in the reproduction of garden photographs that it is much to be regretted that the publishers have not treated the book as well as it deserved in this particular. The photographs, assembled, doubtless, with great care and difficulty, have been turned into half-tones of doubtful quality, and printed in a fashion that would do no credit to a first-class newspaper. With few exceptions they are gray and often vague or lacking in detail—not in the purposeful way in which the skilful photographer gives vagueness, but in the way that carelessness in the press-room and unsuitability in the paper give it.

The Welsh Wars of Edward I.: A Contribution to Mediæval Military History, Based on Original Documents. By John E. Morris, M.A. Oxford: Clarendon Press; New York: Henry Frowde. 1901.

The Welsh campaigns of Edward I. are described by Mr. Morris in great fulness of detail, but also in such a manner as gives them general significance for the mediævalist. In other words, this book is more than a narrative of fighting in the Welsh marches; it is an essay on certain important aspects of warfare during the Middle Ages. Furthermore, it is closely related to the Constitutional history of England. The time was one when the paid soldier was taking the place of the simple feudatory, and when the money which military operations demanded under this new condition could be secured only by a confirmation of the charters. Moreover, the sovereign was the "greatest of the Plantagenets," the chief Constitutional king of that wonderful age, the thirteenth century. Considering space alone, Mr. Morris keeps the local or topographical element prominent, but he does so merely for the sake of thoroughness, that he may by precise demonstration establish certain views concerning military operations and the interlacing of Constitutional development with the development of war.

In different ways this exhaustive study recalls the writings of Round, Clark, and Oman, beside the best of which it is entitled by its quality to stand. For its data it relies largely upon the Exchequer accounts now preserved in the Record Office, although it draws much from the pipe, the patent, and the close rolls. Compared with the definite statements of such sources, the accounts given by even the best of the chroniclers like Hemingburgh, Trivet, and Wykes of Osney seem vague and misleading, but occasionally they yield a valuable passage, as, for instance, the description by Trivet of Warwick's victory over the Welsh near Conway in 1295. Mr. Morris has taken infinite pains with his preparation, and his results are so clearly stated that none of his labor seems wasted.

The groundwork is furnished in large part by a statistical analysis of the Edwardian army. Every one knows how misleading mediæval statements are regarding numbers, when once the modest limit of three figures is passed. Unfortunately, it is not possible to discover, however diligent research may be, what the forces actually were in every case, or how they were equipped, or in what order they fought, but the pay-rolls furnish accurate figures, so far as they go, and much may be gleaned from material contained in the 'Parliamentary Writs.' Thus a basis of inference is established, and important conclusions, both negative and positive, may be drawn. One of them is that the normal strength of an Edwardian force towards the close of the reign is about 2,000 horse and 10,000 foot; another, that "the legend of the 40,000 horse and 60,000 foot of Bannockburn is the merest poetic figment."

Mr. Morris is particularly interested in the history of the long-bow. How had the English archers been trained who riddled and turned the ranks of the French chivalry at Crécy and Poitiers? The usual answer to such a question points in the direction of the Scottish wars, and fixes chiefly upon the battle of Falkirk. Mr. Morris carries the evolution back one stage and connects it with the Welsh wars. "It is clear that the earliest foot, partly spearmen, partly bow-armed, were drawn alike from the Welsh 'friendlies' of marcher lordships and from the border counties between Lancashire and Gloucestershire, while the men of nearly all the other English counties had yet to be trained in the Scottish wars." Another matter which Mr. Morris keeps well in view is the intermingling of bowmen with cavalry and the gradual emergence of an infantry force. Edward's systematic methods also anticipated the transformation of war from the feudal to the modern type.

These campaigns must, perforce, be regarded from the English standpoint, because little information concerning the equipment and projects of the Welsh can be secured. "We know hardly anything of Llewelyn's men. Their tactics were of the guerrilla type. They avoided pitched battles, sought cover in the forests and mountains, and loved to pounce upon convoys. They were very active and difficult to reach. Their chief weapon was a long spear, and one doubts if the Welsh of the north ever practised archery." They fought stubbornly, but, after they were once beat-

en, the marches became an excellent recruiting ground for the English kings. The Welsh entered into the Hundred Years' War with the same eagerness which the Scottish clansmen showed in the Seven Years' War. Despite the later rising under Glyndwr, large numbers of men from the west side of the marches were serving against the French in the fourteenth century.

Apart from his account of the campaigns themselves, Mr. Morris discusses the relations of England and Wales during the Norman period, the organization of the Edwardian army, the custom of the march, and events leading from the Welsh wars. Altogether, this is a work of solid scholarship and lasting value.

BOOKS OF THE WEEK.

Embroidered Swisses

at "The Linen Store."

The Swiss Muslins are still among the most popular of the sheer fabrics for summer and evening wear.

Some of the newest designs show large figures, such as the bow-knot and stripe, bow-knot and medallion, and vine and dot combinations. One very attractive pattern is composed of graduated fleur-de-lis arranged in the form of circles.

Also polka dots in all sizes, including white on black, black dots on white and on the ecru or linen shade.

A great variety of color combinations is represented.

30 in. wide, 50c. to 1.00 yard.
44 " " $1.00 " 2.00 "

Our stock of wash fabrics includes an unusually comprehensive collection of linen, cotton and silk materials for waists, suitings and gowns.

Mail orders have prompt attention.

"Mr. Furness's noble work will be a lasting honor to American letters."—*Times* (N. Y.).

"This, the most exhaustive work on any one of Shakespeare's plays, comes from America."—*Athenæum* (London).

Dr. W. J. Rolfe says of a recent volume: "This book, like its predecessors, is encyclopædic and exhaustive—the entire literature of the subject compressed into a single volume, and the more valuable for the editor's personal contributions thereto."

J. B. LIPPINCOTT COMPANY, Publishers, Philadelphia

The Nation.

NEW YORK, THURSDAY, FEBRUARY 6, 1902.

The Week.

Some of the desperate shifts resorted to at the eleventh hour by the enemies of Cuba's welfare are sufficient to show that they know their cause to be failing. The Speaker is reported to have warned the President of the bad political consequences of keeping faith with Cuba. It may give the next House to the Democrats. To this the ready retort would be that an even surer way of giving it to them would be to exhibit the Republican majority as a set of protection-ridden poltroons; but we suspect that Mr. Henderson got a sharper and more scornful reply than this if he tried to frighten Mr. Roosevelt away from a moral position by threats of what might happen if he did not run ignominiously from his own words. More ingenious, but equally futile, is the other idea of clapping a countervailing duty on German and Austrian sugar, and so giving the Cubans a practical differential. Aside from the difficulty of doing so legally, the notion of deliberately entering upon a fierce tariff war with Germany and Austria in order to avoid keeping our promises to Cuba, is one which might be entertained in Bedlam, but certainly never will be in the White House.

Tax-reduction is an undoubted and imperative necessity, yet we cannot think the bill reported by the Ways and Means Committee for repealing war taxes altogether wise, either in manner or matter. Say what Chairman Payne may, the suspicion will remain that this suddenly devised bill of his had a sinister relation to the project for the relief of Cuba. It may have been intended, first of all, to get in the way of Cuban legislation and block it by indefinite delay; and, further than that, to make the argument in behalf of Cuba more difficult by cutting down the huge surplus out of which concessions could so easily be made. But, saying nothing about this, the measure has too slap-dash an appearance to look like a carefully considered plan of tax-reduction. Whole classes of taxes are swept clean away without sufficient inquiry as to their productiveness or oppressive nature, and without asking whether other taxes are not more burdensome and might not be removed with greater benefit to all concerned. It looks as if the House were once more playing stupidly into the hands of the Senate—hurrying through ill-considered bills for the sole purpose of showing the country that the Senate must be looked to for the patient framing of proper legislation.

It was only by a hair's breadth that "tariff-tinkering" was kept out of the bill for doing away with war taxes. Congressman Babcock's amendment putting certain iron and steel products on the free list received two Republican votes in committee, and was defeated by only one majority. It is obvious that the same proportion of Republican votes in the whole House would easily pass the Babcock measure. This fact of itself indicates a state of discontent with the existing tariff, even within the party. In it a real statesman would have found his opportunity. Imagine the use which a Gladstone or a Peel would have made of it. He would have insisted, as Gladstone did in his budgets, upon retaining every tax possible that rested on accumulated wealth, and upon abolishing every tax possible that burdened national industry. Better that the workingman pay a tax on his beer and tobacco, asserted the great Chancellor of the Exchequer, than that customs duties should interfere with the manufactures from which he derives his wages. The United States is now very much in the position, industrially, that was occupied by England in the years when Gladstone came forward to strike off the last fetters upon free trade. The immense prosperity that followed, everybody knows. Yet our statesmen, in a similar juncture, would throw away easily borne and automatically collected taxes for the sake of retaining those which are a standing menace to our commerce.

It is a sorry joke which the Manila correspondent of the Associated Press is trying to play on the American people. He gravely informs them that "two parties have been formed" in the Philippines, "the optimists and the pessimists." This may pass with the thoughtless. The wag goes on to say that what the optimists and the pessimists are disputing about is the question whether life and property are safe in the Philippines outside of the towns. As if it could not be determined by a simple experiment! Adjourn the debate to the back country, and see what happens. Any optimist would be willing to risk having his throat cut to prove that he was right; and a knife between the shoulders of a pessimist could not really deepen his melancholy. But our Manila jester pushes the laughing matter too far when he solemnly writes about the importance of having a "large body of resourceful and self-reliant" promoters and exploiters scattered throughout the archipelago, to act as a "reserve force in case of necessity." In the case of necessity imagined, it is obvious that this "reserve force" of isolated Americans would be found reserved in jail, or headless in a ditch, and such a result would be certain to swell the ranks of the pessimists.

A large map has been prepared at the War Department under the direction of Gov. Taft, representing graphically the spread of civil government over practically the whole Christianized territory of the Philippines, showing the districts under military rule to be practically confined to the pagan peoples in the extreme southern islands, where Spain never obtained a firm foothold. The map, it is said, also demonstrates the comparatively insignificant area now in revolt, there being no insurrection outside of Samar, Laguna, and Batangas. It is added that "throughout the rest of the archipelago peace and *contentment* reign under civil rule." In the same newspapers which supply this information is a dispatch from Manila saying that "the policy of *reconcentration* and the stern measures of closing the ports to commerce have accomplished everything expected of them." The improved conditions represented in the map are due to the policy of Weyler, which we have adopted and enforced so successfully against the Filipinos. "Peace and contentment" are the terms here used to describe the results of reconcentration. Subjugation and silence would seem to be more appropriate.

Evidence as to the use of the water-cure torture by American officers in the Philippines continues to accumulate. A correspondent of the Manila *Times*, writing from Samar, in August, had the following to say of the methods of Major, now Lieut.-Col., John J. O'Connell, First Infantry: "Major John J. O'Connell, First Infantry, of Gussie expedition fame, who arrived on the scene about this time [after the killing of Lieut. Downes and a soldier] as commanding officer, said that a good *shaking-up* all around would be good; that 'he wanted no traitors about him.' Therefore, all the suspected were given a 'dose' of the 'water-cure,' which proved effectual in bringing to light the guilty. These were locked up in prison." This officer has been in the army since 1865, and served in the war to free Cuba from the horrors of Weylerism. Yet in Samar, if this account be true, he surpasses the Spaniards by applying one of the most exquisite modes of torture known to mediæval or modern times—one which he never would have dreamed of applying to any Confederates in 1865, to any Indians on the plains, or to any Spaniards in Cuba. But the Filipino, being an Asiatic, must not complain, and must proceed to love us at once, even though we violate the laws of war so cruelly. The War Department

or the Philippine Investigating Committee should ask Lieut.-Col. O'Connell under oath as to the correctness of the Manila *Times's* correspondence. A regular army officer newly returned from the Philippines says: "I have never seen the 'water-cure' practised, though I have had fifteen or twenty officers tell me how they did it, and I know they were telling the truth. I have seen the apparatus in the Manila prisons, and know that it was habitually used there."

Mr. A. Burlingame Johnson, who on Thursday gave his views upon the Philippine situation to the extent of three columns in the *Tribune*, insisted that the Filipinos would accept the Americans as their rightful lords and masters if the Americans would only accept them. Mr. Johnson believes in practising what he preaches, and, therefore, is doing his best to make as much money out of the Philippines as he can. He resigned his place as consul at Amoy in order to help develop the Philippine Islands, and, after careful study of the situation, hit upon Negros as the most promising field. Hence his great familiarity with the Philippine situation, and the ease with which he sees peace only, at the very moment that Col. Miner, Sixth Infantry, commanding officer in Negros, reports the situation there as again extremely unsatisfactory, although the island has been completely "pacified" four times to our certain knowledge. The Philippine Syndicate over which Mr. Johnson presides has very broad-gauge plans. It is to construct a railroad in Negros 140 miles long from Escalante to San Juan de Ilog; to develop immediately 10,000 acres of choice sugar land, to be stocked with up-to-date machinery; and to acquire still more extensive tracts of sugar land and some rich mineral property. As a side issue, the Syndicate will erect an electric light plant in Iloilo, for which a municipal contract for 300 lights is about to be secured. Our readers will admit, we are sure, that Mr. Johnson is one of the most consistent men in the United States. We sincerely trust that nobody will be so unkind as to suggest that assurances of peaceful conditions in the Philippines come with dubious taste from one who is seeking to induce capital to go there. Mr. Johnson is evidently too high-minded a civilizer of the beneficent Anglo-Saxon type to be affected by any such considerations as would influence the ordinary man seeking to attract capital to a mercantile enterprise.

The treaty recently signed by Secretary Hay and the Danish Minister is not without its fine political irony. The impartial observer must be struck by the fact that this treaty has been signed by the representative of the first Danish Liberal Ministry of recent times, in direct defiance of the expressed wish of a large proportion of citizens of the mother country and the colony. But now that the preliminaries of the sale have been a second time consummated, and with every prospect of speedy approval by the Senate, the question of the reluctance of the inhabitants of these islands to change their allegiance becomes of actual interest to us. Even if we regard it as old-fashioned to refuse to buy territory simply because the inhabitants object to being sold, we must feel some interest in the cause of this dissatisfaction. With the Danes at home the feeling is almost wholly sentimental—the natural disinclination to surrender any part of little Denmark. On the islands also this feeling is strong, but it is combined with more practical objections. The strongest of these is the fear of the mixed population that their present democratic position of equality with the whites will suffer a change to the aristocratic exclusiveness of this republic. In Copenhagen, colored people are received at the best hotels, and it is possible to share a box at the Royal Theatre with a member of the "inferior race." The main element in favor of annexation is the influential class of plantation-owners, many of them already American citizens, who hope to gain a better market for their sugar. The whole situation is similar to that in Hawaii, a few years ago, with the substitution of a bargain-counter sale for a comic-opera revolution.

Senator Bacon's adroit amendment, by which the new executive department is to be entitled the Department of Commerce and Labor, probably had something to do with the easy adoption of the bill by the Senate. As it now goes to the House, it has not been much disfigured. With one or two unimportant exceptions, the new Secretary will control all of the bureaus allotted to him by the measure as introduced. The proposed amendment by which the Interstate Commerce Commission would have been included, was withdrawn, because its mover "has been convinced that such a transfer would destroy the functions of the Commission." Just why such a result should be anticipated is not clear, but unwillingness to incorporate the Interstate Commerce Commission with the new department may be easily accounted for on the ground that such a transfer would undoubtedly enlarge the powers of the new Secretary to an excessive degree. Some exception to the title of the department will probably be taken by objectors. Inherently there is no more reason for a Department of Commerce and Labor than for one of commerce and manufactures. The change of title will, however, be a final reply to Mr. Gompers's prospective demand for a "Secretary of Labor," and is probably as good a compromise as could have been arranged.

Unluckily for the happy-family theory of public office as a "divide," there is a very particular and supersensitive person in the White House who will not tolerate it in the Federal service. The country saw, some weeks ago, in the President's summary removal of the Governor of Oklahoma for allowing a corporation to "place" $10,000 worth of stock with some "friends to whom," said the innocent Gov. Jenkins, "I owed some political obligations"—the country saw with surprise that altogether too nice standards would be insisted on by Mr. Roosevelt. Does he think that he can suspend the operations of the laws of commerce (political), or prevent bosses and candidates from selling their wares in the dearest market? We hear just now of his having demanded the resignation of two Republican office-holders in a Southern State. One was paying the other $500 a year out of his salary. Neither had the slightest idea of anything wrong in the transaction. We understand that the office-holder who surrendered the money to the other (in consideration of his standing aside as a candidate for the better-paying berth) is especially indignant that there should be any question of his stainless honor. What higher proof could he give of his absolute disinterestedness in office? He argued that, when the President himself is capable of equal devotion to duty, not to mere money rewards, and will offer to give up $5,000 of *his* salary to a rival, it will be time for him to make reflections on the conduct of as pure a patriot as ever delivered delegates to Hanna. But the "very positive young man" in the White House demands the resignation obstinately, in perfectly brutal disregard of the new code of honor among office-brokers and office-holders.

The action of the United Mine Workers at Indianapolis in ordering an assessment for a strike fund producing $23,228 a month, has an unfortunate air. It was thought to be the determination of President Mitchell to bring the miners' grievances before the Arbitration Committee of the Civic Federation. It would now seem, however, that he intends to fall back upon the strike. One passage in the resolutions of the convention is of peculiar significance. Strikes in the past have often been confined to the bituminous or to the anthracite fields, and they have frequently been defeated by the substitution of one kind of coal for the other by consumers. It is probably with this fact in mind that the mine workers say that, "should it develop that coal is being shipped from the bituminous districts into those markets which properly belong to the anthracite product, or should it develop that the Eastern railroads which now consume anthracite are being supplied with coal mined by members of our organization in the bitumi-

nous fields, the National Executive Board shall have full power to order a sectional or national suspension of work, or take such action as they may deem necessary to make successful the movement of the anthracite workers." This is ominous enough, since the disturbed condition of several important mining sections during the past few months and the strong demand for coal furnish the conditions that usually produce a conflict. It is discouraging that so little heed should be paid to the example of arbitration by the Illinois miners, and so little disposition shown to accept the good offices of the Arbitration Committee of the Civic Federation.

The report of the State Board of Tax Commissioners on the special franchise tax which was passed by the Legislature during Gov. Roosevelt's Administration, informs us that in the rural counties, where taxpaying has become a patriotic practice, payment has been made upon these assessments, almost without exception, without quibble or protest, and that it is estimated that, outside of New York city, taxes have been paid upon fully 80 per cent. of the special franchise valuations made in 1900. The sum of $1,021,000 was thus paid into the local treasuries in that year. There were, however, 278 writs of certiorari served on the Board by tax fighters in the cities; that is, appeals to the courts to review and reverse or modify the valuations of the Board. The tone of the report is encouraging, and leads to the belief that the obstacles heaped up by corporation lawyers against the franchise tax will be swept away, and the litigation soon be brought to an end. The operation of the law of 1901, eliminating street and highway crossings from special franchise assessment, has been to reduce the valuations about $10,000,000. Neither the effect nor the reason for that law was understood at the time when it was passed. It was slipped through without notice. The reason for it is now very plain. It reduced the amount of taxes to be paid by the franchise holders about $200,000.

No very good reason is apparent for the action of the State Senate on Thursday in recommitting the Cocks Automobile Bill. The bill as originally reported provided that no automobile should be driven on a public highway at a speed greater than twenty miles an hour, under penalty of fine or imprisonment. That there is pressing need of some restriction upon reckless driving is proved by numerous complaints from many portions of the State. In certain sections, said Senator White, the residents of little townships are fairly excluded from roads recently constructed at great expense. Such a condition clearly calls for legislative relief, and the Cocks bill certainly imposed no unduly severe penalty. It is the alternative of imprisonment which arouses the automobile interests against it. Of their suggestion that reckless driving be made a misdemeanor only upon the third offence, and that the first and second offences be punishable only by a fine, it may be said, first, that the proposed fines of $25 and $50 are not a sufficient deterrent to the wealthy class of chauffeurs; next, that, in view of the difficulty of detecting violations of the speed law and of catching the offender, to relegate imprisonment to the third infraction of the law is practically to remove it from the law entirely. Judges, in any case, would hardly apply the penalty of imprisonment recklessly, any more than they do in other instances; for example, the anti-spitting ordinance. But the courts should be free to deal with cases of gross carelessness in the most exemplary fashion, and without waiting till the gross carelessness has been thrice committed. The law, with the amendments proposed by the President of the Automobile Club, would be no law at all, but a kind of low-license measure for the dangerous misuse of the public highways.

That, even under the worst kind of Quay misrule, civic pride and the desire for municipal betterment cannot be crushed to earth, has recently been demonstrated in Harrisburg, Pennsylvania. The seat of a most corrupt Legislature and the scene of many an unblushing "steal" from the State, it would have surprised no one had the city simply settled down to a condition of hopeless indifference to its own needs. Such has not been the case, however, for last May some sixty public-spirited citizens raised a fund of $5,075, to employ three experts to study municipal conditions and to suggest plans for the sanitary and æsthetic regeneration of the town. This was done under the supervision of an executive committee of seven, together with the Mayor, the city engineer, and one member from each of the local legislative bodies. The first result is the publication of a report of 120 pages, setting forth in detail how the city's park system may be properly developed, how the water supply and sewage system may be modernized, at a cost of but $661,000, and how the highways and streets may be improved. As the plans for the park system call for an expenditure of only $300,000, this and the water supply and sewage changes can be undertaken at once, while a good start can be made in the direction of bettering highways, as the city may increase its indebtedness by nearly $1,100,000. The action of these public-spirited citizens of Harrisburg is another extremely encouraging example of the widespread awakening to the needs and responsibilities of our American cities. It may even be possible that, with such an example in their own commonwealth before them, Philadelphians will realize the low estate to which they are fallen.

That drift of population to the cities which is so strongly marked in the more densely peopled countries may be observed also in Canada. In 1891 the great province of Ontario had a total population of 2,114,000, of whom 1,295,000 were rural and 819,000 urban. The corresponding census figures for the year just past show a total population of 2,182,900. Of these, 1,247,000 live in the country, and 935,700 in the towns and cities. That is, the country has lost in the decade about 48,000 inhabitants, while the towns have gained 116,700. These figures are especially striking because Ontario is still under-populated rather than over-populated, and because the provincial and the national Governments make systematic efforts to attract immigrants to the farms. In the great wheat-growing province, Manitoba, these efforts have been successful. In ten years past the increase in the fields has been 73,000, in the towns only 29,000. But the fact that the drift to the towns is so strongly marked in the largest Canadian province seems to show that this movement rests upon social rather than economic motives. For in Ontario there is not the excuse of a depleted soil or of hard conditions of tillage. It is probably, as in other countries, quite as much discontent with the social conditions in the farming districts as the hope of bettered fortunes that drives thousands to exchange the comparative certainty and comfort of the farmer's life for the great hazards of the town.

Prince Henry is coming, but the Reichstag goes on with its plans to pay us off in our own tariff coin. Its tariff committee accepted on Friday the clause of the new bill providing that, in the absence of treaty stipulations, the same rates of duty shall be applied to foreign goods as are enforced, in the country of their origin, against "similar German goods." Do our Western farmers know what this means? It means Dingley rates clapped upon American wheat and bacon and pork seeking a market in Germany. The "fake" agricultural duties put into our law to fool the simple-minded farmer will, in other words, become a stern reality in German hands. On our wheat we should have to face a tariff tax of 25 cents a bushel; bacon and hams would have to pay 5 cents per pound, salt pork 25 per cent. ad valorem, and so on. Meanwhile the German reciprocity treaty sleeps the sleep of the forgotten in the Senate, and, with a tariff war plainly in sight, we are giving ourselves up to the coming fêtes intended to show our warm friendship for Germany. This is a fatal misreading of the signs of the times.

SCHURMAN VS. TAFT.

The people of the United States are beginning to ask themselves in a serious way why they are in the Philippine Islands, and whether they are to remain there for ever; and, if so, what relations they are to hold with the people thereof. The smoke of battle has blown away, the glamour of being a world Power has ceased to charm, the realities of death and disease are sickening the hearts and stirring the consciences of many. To all such, President Schurman's monograph of 109 pages, just published by Scribners, will come as a light in a dark place. To the questions why we are in the Philippines, what we are to do with them, and when we ought to do it, he gives unequivocal, straightforward answers. Unless we are hypocrites, unless we have backslidden from republican principles, unless we are oppressors of our fellowmen without cause and against reason, we must either take them into our political system, or we must give them their independence. The former we can never do.

"No political party," he says, "will ever propose so insane a programme; no statesman will ever venture to advocate a policy so repugnant to American sentiment. The case needs no arguing. The objections to the plan are insuperable; the reasons against it invincible; the hostility to it ingrained and ineradicable."

What is the alternative? Either to hold them as subject provinces, or give them liberty *and* independence, for the one cannot subsist without the other. If this is not what we are in the Philippines for, if we are there for commercial gain, or to make our power felt in Asia, or for any other selfish purpose, then are we destined to vast and bitter disappointment, and eventually to poignant remorse. One more paragraph out of many of equal plainness that we might quote, is this:

"No prospect of profit, however assured, no wealth or advantage, however colossal, could ever atone for the precious American life-blood swallowed up by the hungry soil of Luzon and the Visayas. For such a sacrifice there is only one justification: it is the discharge of duty, service in a righteous cause. If our presence in the Philippines be not justified in its purpose and intent, then our soldiers' blood is on our hands; ay, and all the blood, in that case innocent, of the Filipinos we have fought, the misery we have caused their families, and the devastation we have wrought in their homes."

Whether we are there in the discharge of duty and in the service of a righteous cause depends upon our course in the immediate future. Mr. Schurman thinks that the time has now come for Congress to order the election of a representative assembly in the pacified provinces—that is, in all the provinces except Cebu, Bohol, Samar, Batangas, and Mindoro; that the delegates so chosen should be allowed to declare whether they wish independence or not, and, if so, at what date they think it should be conferred, "and then," he says, "we shall have before us all the conditions necessary for the final solution of the Philippine problem." Whether or not this plan will be entirely satisfactory to those among us who have opposed occupation of the islands, we feel sure that they will place no obstacles in the way of carrying it into execution.

Mr. Schurman gives his reasons for thinking that the time has now come for taking this step. He says that when he was in the islands himself as chairman of the first Philippine Commission, looking at the heterogeneousness of the populations, races, and languages, and their antipathies to each other, he had thought that a whole generation would be needed to solidify them as a nation and compose their antagonism. He finds now from the testimony of Gen. Chaffee that they have been forced into a union among themselves by the very war waged against them. Gen. Chaffee has been quoted as saying that the natives of the islands are all traitors to American sovereignty, and have their hearts set on independence.

"When I wrote in 1899," says Mr. Schurman, "that no one can foresee when the diverse peoples of the Philippine Islands may be moulded together into a nationality capable of exercising all the functions of independent self-government, though I hoped for the dawning of the day within one generation (as I there intimated), I did not expect as early as 1902 to learn from the commanding general that, under the hammer of war and the heat of strife, the welding of these diverse peoples into a common nationality had been consummated."

Another reason for the faith that is in him is the continued testimony from the civil Government at Manila that the islands, with the exceptions noted, are now pacified.

Mr. Schurman qualifies his opinion as to the time when American control over local administration should be supplanted, by saying that it should not be done until Gov. Taft, or whoever is in charge of the civil government there, approves of it. Turning to Mr. Taft's testimony before the Senate Committee on the Philippines on Saturday, we find that he holds the same opinion now that Mr. Schurman held in 1899. Replying to a question of Senator Rawlins concerning the aims of the Federal party in the Philippines, who are our friends if we have any there, and whose platform contains a declaration that "the Philippine Islands should form an integral part of the United States of America, to be organized as a Territory with all the rights and privileges which the Constitution of the United States concedes to other Territories, including that of becoming in time a State of the Union," he took a very discouraging, almost contemptuous, view of that scheme. According to the newspaper report, "he held the opinion that the question of Statehood, *like the question of independence*, is so far in the future that he did not regard it as of present importance." So we have an issue between the presidents of the first Philippine Commission and of the second one as to the line of policy to be adopted upon an agreed state of facts. Mr. Taft tells us that the islands are so far "pacified" that we can safely withdraw all but 15,000 soldiers. If that is the case, says Mr. Schurman, now is the time to put representative government in motion, with a view to the future independence of the Filipinos. Not at all, says Mr. Taft; all such questions are so far in the future as not to call for present consideration.

This is a sharp difference of opinion, on the part of the highest authorities, in reference to the weightiest question now before the country. More people of the thinking, reflecting, influential classes have been reconciled to our occupation of the Philippines by the arguments of Mr. Schurman's report and by his reputation and authority than by any other means—more even than by the action of President McKinley himself. We shall see now whether they will continue to follow their leader.

IMPERIALISM AD ABSURDUM.

The *émeute* in the Senate, in the course of the Philippine debate on January 28, shows how Imperialism has added to our dignity. Who could imagine Senator Lodge, as a citizen of a mere republic, advancing with clenched fists upon the venerable Senator Teller, while his face "blazed with anger" and his "lips were white with rage"? It is only the proud consciousness of world-empire that inspires such a magnanimous bearing. One remembers the prophecies of the great increment of power and glory which was to come to this nation from the annexation of the Philippines, and it is fine to see how the simple mention of the name of the archipelago, the mere discussion of a bill for a Philippine tariff, impels Senatorial courtesy to preen its wings for a loftier flight. Lodge and the other squabblers are nobly fulfilling their own predictions—namely, that the fact of having to legislate for the isles of the sea would give to Congress a new soberness in debate and a prouder sense of the honor of the American name.

Other such left-handed dignities and strength is Imperialism giving us in the actual working. What could be more absurd than the demand that a supposed military exigency in a miserable little island 7,000 miles away should silence the speech of freemen all over this broad continent? Yet that is the kind of affected terror which has been held up before us for three years past, and which is seen again in Gen. Wheaton's anger in Manila at what President Schurman said in Boston. We say nothing now of the military ethics or the legal principles involved. What strikes us most is the sheer absurdity, the downright pre-

posterousness, of the position. We are asked to surrender one of our greatest privileges and most boasted glories—why? Because we have acquired so much new power and glory that we cannot be allowed to enjoy what we had before!

The absurdest comparisons, as of a philosopher like Kant afraid of his valet, or a King not daring to speak above a whisper lest the cook should hear, could not do justice to the situation to which Imperialism would degrade us. A Senator cannot rise in his place and say what he honestly thinks is for the best interest of the United States, because a boloman in the wilds of Samar might not understand. A man of prominence and authority like President Schurman must be muzzled, lest a Visayan guerrilla leader be encouraged to fight on. What a contemptible plight is this to which Imperialism would bring us! We should have to change the proud saying about the right of a man in the land of the free, whether girt by friend or foe, to speak the thing he will, and modify it so as to read, "provided he first get permission of the military authorities half way round the globe." A President about to send in a message to Congress, a Congress about to enter on a discussion of public measures, newspapers about to comment on the news of the day, must all, according to this new way of padlocking free speech, first ask Gen. Chaffee if it will do. Thus would the Imperialistic tail wag the dog.

Such humiliating bonds are not laid upon free citizens by American Imperialism alone. We see the same principle at work in England. Chamberlain has commanded silence for much the same reasons that have led our military censors to cry "Hush!" More than that, in a recent speech about the possibilities of peace, he took the ground that the Government could not make a peace which is earnestly desired by the people of England, and might be very advantageous to them, unless the distant colonies were satisfied. "A new factor," he affirmed, had entered into English politics. "In future you will have to take account of the opinion of your colonies." If they object to talk about negotiations for peace, why, the negotiations must cease. It was one of the frankest acknowledgments ever made of the way in which an empire may be crippled by its own greatness. It adds island to island, and protectorate to protectorate, only to find that it has but made itself more vulnerable to attack and less able to act on its own initiative. Poison comes from the extremities to dull the brain and paralyze the will.

That this absurd fettering by an Imperialistic policy will long be submitted to by Americans it would be ridiculous to imagine. The Senate is showing us how impossible it is to secure bated breath and whispered humbleness in this country at the word of command from a distant isle of the sea. All these great questions will have to be argued out after the wont of freedom. The very turbulence of debate is one of those "manners of liberty," in Lemaître's phrase, which it is idle to expect Americans to abandon. The reaction is already in full tide. We are going to be allowed to say what we think, and urge the policy we believe best, without waiting to get permission from an officer of infantry in Mindanao, or inquiring too curiously what will be the effect of our words when translated into Tagalog. The Spanish war was said, like the Mexican, to have made us "more respected abroad." In the process we must not fall into less self-respect at home, as we certainly should if we were to ask humble pardon every time that a speech of a college president or a minority report of a Senate committee failed to meet the notions of a soldier in the Philippines. Let our prestige abroad be what it may, it must not be permitted to impair our liberty at home. Lowell's warning of fifty years ago is still in point, in the face of our tawdry Imperialism, tripping over its own bedraggled purple: "We are anxious to be acknowledged as one of the great Powers of Christendom, forgetful that all the fleets and armies in the world are weak in comparison with one sentence in the Declaration of Independence."

PERPETUAL EDUCATIONAL TRUSTS

There is no more considerate provision of the deed of trust of the Carnegie Institution than that by which the founder has empowered his trustees "to modify the conditions and regulations under which the funds may be dispensed, so as to secure that these shall always be applied in the manner best adapted to the changed conditions of the time." This means that the trustees will never find themselves in the ungracious attitude of blinking the very terms of their trusteeship, and discrediting the judgment of the founder from whom they derive their authority. It means, too, that a great philanthropist has had the discretion, and, one may say, the sense of humor, to see that the needs of to-morrow are not those of to-day, and that wisdom does not die with the makers of philanthropic bequests.

It is strange that so simple and sensible an attitude should be unique among great benefactors, and that the teaching of the past in this matter should have been so heroically ignored. Everybody knows that, if every mass solemnly endowed *in perpetuo* for the repose of a soul were sung, the whole Continent of Europe would be vocal in the Gregorian mode; that if the bread and ale provided by pious founders were actually dispensed at the wickets of dismantled abbeys, whole countrysides might dismiss their overseers of the poor. Even when time does not wholly efface such donations, it often leaves them but ridiculous; or reasonable only because their original purpose has been disowned. And yet people confidently seek to perpetuate their personal preferences, or even their simple whims, and corporations still receive bequests the conditions of which, even upon acceptance, they have every intention of evading. The question of casuistry here involved is one of peculiar interest, because the delinquents, potential or actual, belong to the most highly esteemed order of society. What shall one think when the presidents and trustees of institutions of learning or charity play fast and loose with the desires of their benefactors, and, for that matter, with the laws of the land?

Of course, it may be said that common sense imposes a statute of limitations in these matters. Frequently the change in the administration of a trust is so gradual that it would be impossible to determine just when contravention of the founder's purpose began. Thus, one can hardly hold it against the incumbents of several chairs of metaphysics of colonial date that they do not annually denounce *ex cathedra* the errors of Roman Catholic, Arminian, or Baptist theology, as the case may be. And yet such conditions have been the occasion of grave moral scruple, even in recent times. In all cases of this sort it may be assumed (if there was originally nothing eccentric in the terms of the foundation) that the testator, could he be summoned to council, would assent to any reasonable modification of his bequest which changed times might require.

But the matter frequently presents itself in the far less pleasing aspect of early and premeditated evasion by the immediate beneficiaries of the gift. The ingenuity of administrators is constantly at work in arranging to transfer funds given for specific purposes to the general uses of the institution. A certain Eastern college has a chair of American history, literature, and eloquence, founded some ten years ago, the incumbent of which gives *pro-forma* instruction in American history for a few weeks a year, while he illustrates American literature only in his published writing about European travel and art, and American eloquence chiefly in his lectures on the art of the Middle Ages and of the Renaissance. Similarly, the library of a great university has an unduly large fund for, we will say, Scandinavian literature. How many departments fly the Hyperborean flag, for library purposes, it would be unwise to specify, but it is safe to say that only the newest and most ingenuous professors of French, German, Italian, Spanish, or English fail to prove that their desiderata are indispensable to a Scandina-

vian library. The moral question here involved is a complex one, for very generally the beneficiary institutions have had no voice in the framing of the bequest. They have had usually simply the option of accepting the bequest under its conditions or foregoing it entirely. Practically, the moral sense of a corporation, even of a university, is very weak before so crucial a test.

If to be caught in such a moral dilemma is unfortunate, the resultant harm from these apparent perversions of trusts is more apparent than real. It must fairly be assumed that a testator intends primarily to aid the institution in which he creates a foundation. It certainly must be taken for granted that he would not insist upon literal fulfilment of the terms of his will, to the detriment of its beneficiary. But the weighing of the subtile question of relative good, with its infinite possibilities of casuistry, should not, it seems to us, be thrown wholly upon the tender consciences of presidents and trustees. When a specific trust has plainly outlived its usefulness, or, again, if its terms are originally detrimental, it should be possible to obtain from the law-makers an order converting a specific into a general trust, or, when feasible, authorizing a new disposition of the fund which shall be germane to the intention of the founder. So much deference, it seems to us, trustees owe to those from whom they derive their powers. We need hardly add that if donors generally had, like Mr. Carnegie, held the view that if a man is competent to frame a trust wisely, his representatives in future times will be wise enough to change it judiciously, a very pretty question in casuistry, and an occasional stumbling-block in morals, would never have arisen. In this matter Mr. Carnegie has set most gracefully an example which is worthy of general imitation.

JOHN RICHARD GREEN.

In these days the historian inclines to disdain the general reader, but historian and general reader alike may turn for amusement and profit to the Letters of J. R. Green. The one can hardly pass by a correspondence in which Mr. Bryce is affectionately nicknamed the "Holy Roman," and Freeman is told that his "strenuous" prose is "neither prose nor poetry, but like some one holloaing." The other will find that the fun is not confined to mere historical allusion. After collapsing physically in East London, Green is ordered to a "Cockney Patmos" at Margate, whence he writes: "I only came yesterday, and so have no bulletin of health to forward, save that I am taking more kindly to cod-liver oil. Why cods—so exquisite in all else—should concentrate nastiness in their liver, Science may explain." But there is more in these letters than good-humored chaff. They keep touching upon matters of the utmost moment to the historian and of the liveliest interest to every one. They are the outpourings of a man who loved history so intensely because he entered with such dramatic feeling into all the situations of life.

Mr. Leslie Stephen, the editor of the Letters, likens the success of Green's 'Short History' to that which Macaulay's 'History' had met with twenty-five years before. He recalls, however, Macaulay's two advantages in being already famous, and in writing upon a scale which admitted of pictorial treatment; "whereas Green had the difficult problem of combining the greatest possible condensation with undiminished animation of narrative." Regarding the immediate popularity of the book in both hemispheres there can be no doubt. It only remains to ask whether or not the success was deserved. Apart from the damnatory articles in *Fraser's Magazine*, with their long list of inaccuracies, a good many historians feel about the 'Short History' as art critics feel about "the picture of the year," which may be good enough for the Tate Gallery, but is of itself condemned because the multitude like it. What the artists have to say on their own behalf need not concern us. In Green's case the question is important, inasmuch as his attitude towards historical study and composition was extremely pronounced. Although in strict logic the worth or worthlessness of his general views need not be imperilled upon the success or failure of the works wherein he illustrates them, the two things are, as a matter of fact, very likely to be connected.

If it came to an issue of compurgation, Green could collect a great weight of testimony. The writer in *Fraser's Magazine* (September and December, 1875), maintained that the large sale of the 'Short History' was due to the puffing it got from the Freemanites. This allegation was far from being true, as the event has shown, and it rested upon a false foundation. Green was comparatively weak in verbal memory, and the misfortune of ill-health compelled him to do his writing at places where he was beyond the reach of books. Thus, while he took the utmost pains in the revision of his proofs, mistakes of names and dates were bound sometimes to slip in. The hostile reviewer inferred from these that he was superficial, and merely worked up in picturesque form the results of others. On the contrary, Green's learning was wide and solid. Stubbs has said of him:

"All his work was real and original work; few people besides those who knew him well would see, under the charming ease and vivacity of his style, the deep research and sustained industry of the laborious student. But it was so; there was no department of our national records that he had not studied, and I think I may say mastered. Hence, I think, the unity of his dramatic scenes, and the cogency of his historical arguments. Like other people, he made mistakes sometimes; but scarcely ever does the correction of his mistakes affect either the essence of the picture or the force of the argument."

We shall not carry the discussion of Green's accuracy or inaccuracy any further, because for present purposes it is not the essential point. He knew the sources of English history at first hand, and worked with incredible energy to gain the information which his task demanded. He was not in any sense a dilettante. His letters prove this past all doubt, and the story of his methods adds testimony to the letters. Concerning the 'Making of England,' Mr. Stephen says: "This extraordinary achievement had tried his strength to the utmost." And well it might have done. Long before the work was finished, Sir Andrew Clark had said that Green could not live for six weeks. Yet he kept alive by dint of will power, and spared no exertion to make his book perfect. "For many weeks, he could not sit up or take solid food. He was unable to hold a pen, or even to make pencil corrections on a proof. At intervals he could dictate for a short time or go through references with his wife's help. He dictated, as he talked, very rapidly, and with perfect clearness and precision." In spite of this facility in composition, much of the book was wholly rewritten five times, and for parts of it there were eight or ten different proofs. "When the last proof had been corrected, a discovery was made about a certain Aethelwald. Wearied as he was, Green spent two more days in work rather than leave the incorrect statement."

With Green a *tour de force* like this did not represent the feverish excitement of a dying man so much as the unflinching enthusiasm of the born historian. Unlike 'Vathek,' for instance, the 'Making of England' was less a spasmodic effort than the fruit of deliberate and steady purpose. Green was always full of ideas, full of sympathy, full of eagerness. He was a brilliant talker, a ready and effective speaker. Whomsoever he met, his intense vitality and directness left their effect upon the hearer. Mr. Bryce heard him preach for the first time when he was at St. Philip's, Stepney. "I shall never forget the impression made on me by the impassioned, fiery little figure in the pulpit, with its thin face and bright black eyes." His paper on Dunstan, delivered in 1862 before the Somersetshire Archæological Society, carried Freeman by storm. After a visit to Hampden in 1895, Sir M. E. Grant Duff wrote in his diary: "Green, whom the more I see of him, the more I think likely to be, if he lives, the greatest English historian who has yet been, with the exception of Gibbon." Mrs. Humphry Ward has written: "There was in him a perpetual eagerness, an inexhaustible power of knowledge, that were ever putting idler or emptier minds to shame."

We have collected these passages about Green by those who knew him, partly because they are sincere tributes to the memory of a remarkable man, and partly because they describe in terser form the qualities which are expressed with living reality throughout the whole course of his letters. Here undoubtedly was one whom nature destined to be an historian as she destines another to be a painter, and a third to be a musician. He had the power, so rarely given to historical writers, of realizing the past by a true poetic sense. Sir M. E. Grant Duff says he never had it so much brought home "that the real historian is an animal different from and of a superior order to ordinary human beings who possess the power of narration," as when he saw the effect produced on Green by the view from Whiteleaf Cross. If you call an historian imaginative, some people will think you mean that he draws on his imagination for his facts. Green had power, and his power was due to the fervor of his imagination, working, as it did, harmoniously with his warmth of heart and his interest in human life.

Can the historian who lacks these gifts

ever be more than a collector of facts and a master of logic? The scientific age had come even in Green's time. It is just twenty-five years since he wrote to Macmillan that he must decline to be editor of the proposed *English Historical Review:*

"I shall be looked upon by the bulk of historic scholars as a person imposed on the review by the unhappy necessity of securing a publisher and a popular circulation, and as the representative not of the scientific, but of the non-scientific, elements in it. The justice of this is not to the purpose here: but I must own that, for my own part, I feel my historic tendencies to be sufficiently at variance with the general tendency of historic research just now to give such sentiments a certain color of truth."

Perhaps the strongest praise which Green has received from Stubbs is contained in the following words: "In him the desire of stating and pointing the truth of history was as strong as the wish to make both his pictures and his arguments strong and forcible. He never treated an opposing view with intolerance and contumely; his handling of controversial matter was exemplary." So it was when he faced the difference between his conception of history and Mr. Gardiner's. He did not think the "pragmatic" historians unjust for attacking his view. "It is very natural that, working as they do to bring out the actual political facts and clear away loose talk, they should look jealously at what is, in effect, a protest against their whole conception of history, and what must look to many of them like an attempt to bring the loose talk back again." Nevertheless, his conviction was plain. He felt that, however imperfect, his work was "on the old traditional lines of English historians." He was a liberal to the tips of his fingers, he accepted the scentific method, and science swept him away from the church whose ministry he had entered; but in a scientific age he felt himself to be a *vox clamantis*, whose business it was to protest against mere pragmatism. Every word he writes goes to the same point—"to a protest, that is, against the tendency to a merely external political view of human affairs, and to a belief that political history, to be intelligible, must be based on social history in its largest sense."

Among historians the scientific method, which began long ago as a heresy, tends in the days of its triumph to harden into a superstition. Above all things, a good historian is never narrow. Green's principles run counter to the present tendency on this continent, as they clashed with the principles of his leading contemporaries in England. Yet there is much in his letters that historians should read and weigh. While every one will be impressed by the spectacle which they afford of high-minded enthusiasm, of devotion to friends, of intellectual honesty, and of an intrepidity almost surpassing belief, the teacher and writer of history may well ponder these words: "We English folk live in free human air, and it is impossible to us to sink into 'mere paper-chasers.' And so I don't doubt that the English ideal of history will in the long run be what Gibbon made it in his day, the first in the world; because it can alone combine the love of accuracy and external facts with the sense that government and outer facts are but the outcome of individual men, and men what body, mind, and spirit make them."

CONDITIONS IN PORTO RICO.

SAN JUAN, January, 1902.

One of the most prominent members of President Roosevelt's Cabinet lately said the Government at Washington was so well satisfied with the conditions in Porto Rico that it gave no more thought to that island than it gave to the State of New Jersey. While this attitude of the authorities at Washington is sufficiently complimentary to the insular Government, there still remain unsettled a few questions of moment relating to Porto Rico, which it would be well if the Washington officials did not so readily dismiss from their minds.

While in a political sense the island and its affairs, the system of insular government, including the system of taxation, of revenues, and of public schools, have been set going to the entire satisfaction of the President and his advisers, and have ceased to be a source of doubt and anxiety, in a commercial sense the island and its possibilities are just on the verge of discovery by the people of the United States. The newspapers in "the States," the title by which the islanders distinguish the home country from its new possessions, have just recorded certain experiments made in Connecticut in the direction of producing a cigar-wrapper like the Sumatra wrapper by growing the leaf under shade. More than two months ago a representative of the Tobacco Trust went to Porto Rico prepared to grow a tobacco crop under the shelter of canvas or wooden slats. He selected a field in the Cayey district, and by this time his crop should be well under way. Unless high winds, which are more frequent in Porto Rico than in Connecticut, should destroy the shelter, there can be little doubt of the success of this early and important experiment in thinning the Porto Rican leaf and growing for the United States market what is considered by Americans a more attractive wrapper than this leaf in its natural state produces. The removal, last summer, of the United States tariff on Porto Rican tobacco caused so sudden and enormous a growth of the market in the States for Porto Rican cigars that some manufacturers were unable to supply the demand for their product.

The coffee industry is in a less flourishing state. The hurricane of two years ago did great damage to the coffee plantations, and from it they have not recovered. Moreover, the Spanish duty on Porto Rican coffee has had the effect of closing this important transatlantic market, and the people of the United States are not yet aware of the great superiority of the island coffee in richness of body and flavor over the thinner Brazilian coffees, which are so largely consumed in the States, where the latter coffees are bought by consumers for the Java and Mocha product; the Mocha being readily supplied by sorting the round berries from the flat ones growing in the same pod. The influences named, together with the desire of Spanish owners to withdraw from the island since it has come under American rule, have resulted in placing coffee plantations in the market at much less than their former value.

The future prospects of the sugar industry are indicated by the erection by the American Sugar Trust of what is believed to be the most complete plant in the world for crushing the cane. In the extraordinary depth and richness of the soil, and in the climate, to which frost is unknown, and which permits one crop to succeed another as fast as the first matures, is found the certainty of a great agricultural development in the future, to which the agricultural schools started by Dr. Brumbaugh, the former capable Commissioner of Education, will also in turn contribute. With a population of nearly one million inhabitants, in an island some ninety miles in length and forty in width, but one-fifth of the land is at present cultivated, and thousands of the natives suffer from anæmia, the most common disease of the island, largely because of an unvaried diet of a few fruits obtainable without labor.

As a winter resort for Americans, the development of Porto Rico will probably wait upon the building of roads and the introduction of means to vary the monotony of life. A few miles from Coamo, which is on the military road within an easy drive from Ponce, at Coamo Springs, the Spaniards maintained a resort which is well worth a visit. The hot waters gush from the hillside into the stone baths, whose size, huge stoppers and faucets excite the visitor's curiosity. The grounds have an interesting collection of tropical vegetation, and the rooms, beds, and cuisine are not only safe—which is a high recommendation in a hot climate—they would be unusually attractive in the United States or Europe. The same thing may be said of the French hotel in Ponce. But at San Juan, the capital, a good hotel, clean in all its appointments, is needed.

The most marked progress in Porto Rico has been made in the school work under Dr. Brumbaugh. The new frame schoolhouses met with in all parts of the island, or the old Spanish buildings of stone altered into schoolhouses, all with American flags waving over them, are, of course, more visible evidences of work accomplished than are the results of other governmental work on the part of Gov. Hunt and his subordinates. But even allowing for this, the chief hope for the future of Porto Rico seems to lie in the school work. At Ponce there is a school of some 400 children in which no Spanish is used. Even in the "shack" school on the mountain top the native teacher, clad in her simple but clean gown, her stockingless feet covered with slippers, is day by day teaching the English equivalents of Spanish words. Everywhere American patriotic songs are sung by the children, often in English, and the dedications of new schoolhouses exhibit the hospitality of the local Porto Rican authorities and their enthusiasm in the cause of education as well as the ardor of the children. With what spirit these last sing "The Star-Spangled Banner" and wave their tiny American flags! These occasions were always used by Dr. Brumbaugh to impress upon the large gatherings of adults and children that opportunity for all to learn to work and to develop followed the flag, and everywhere the eager faces showed appreciation of the new doctrine. Perhaps not much can be expected of the ignorant adult population of mixed blood; but the 50,000 cleanly dressed, bright-looking children now cared for by the public-school system, which includes a normal school, are destined to lead the native population of the island from the shiftless shack life which has endured so long.

The chief American officials in Porto Rico are, without exception, men of high character, dignity, and ability, who have the future welfare of the island at heart. The only thing to make an American blush, if some inferior bridge-building under the military government be excepted, had its source at Washington. Popularly, the influence of a prominent United States Senator is credited with responsibility for the extraordinary powers conferred upon the Bank of Porto Rico at San Juan. Congress permits the bank, with a capital of $900,000 and power to increase it to $1,200,000, to issue banknotes at present to the amount of $2,700,000, and to increase the circulation to $3,600,000—which latter sum is equal to the entire circulation of money in the island. Of the authority thus misplaced, Treasurer J. H. Hollander, well known by reason of his connection with Johns Hopkins University, and as the author of the revenue law of Porto Rico, said: "The possibility of large issues at any time in the future cannot be regarded as other than a standing menace to the financial security of the island. . . . No sane mind [in the United States] would propose to vest in a private agency power to issue notes to an amount equal to the total circulation of the country, and enjoying no preference over other liabilities of the bank with respect to the security given by a metallic reserve of one-third. Yet this is precisely the relation of the Spanish bank to the island of Porto Rico." The custom-houses and the post-offices in the island will not accept the bank's notes.

It is understood that the Danish islands, when ceded to the United States, will come under the insular government at San Juan. Already the island of Porto Rico is self-supporting. The island politics is absurdly personal from habit. The Federalist still regards the Republican as an enemy not fit to break bread with and unworthy of any recognition. He is, perhaps, as vociferous a herald of a personal cause as the world has ever seen; but, fortunately, his energy evaporates in speech. The swift years will change many, and the rest will die. The Federalist would like a Territorial or State government, with himself and his friends in the offices. The time for Porto Rico to become a Territory will be nearer when the school agencies have sent a hundred thousand pupils back to their communities, there to spread the example of respect for labor, truth, and decent living, for manhood and womanhood.

THE CRISIS IN THE FRENCH THEATRE.

PARIS, January 17, 1902.

It must be a surprise to a foreigner, happening by chance to go through Paris, to see how much space is devoted in our newspapers to theatrical matters. For some little time we have been in a state of excitement over the quarrel which has arisen between the administrator of the Comédie-Française and the actors of this theatre, which is considered the best school of acting in France. The choice of the plays has been left till this year to a chosen committee of actors and actresses, having the rank of *sociétaires* or partners, and constituting what was called the Reading Committee. It was a great honor for an author to have a play read before these severe judges; at the end of the reading a vote was taken—the play was refused, or admitted, or admitted conditionally upon revision. This has all been changed by a stroke of the pen of the Minister of Instruction and Fine Arts. The Théâtre-Français, receiving an annual subsidy from the state, is under the supervision of this minister. The Reading Committee has been simply abolished. The "Maison de Molière," as it is often called, had to change its form of government; the administrator alone will have the right to accept or to refuse a new play. An absolute government is substituted for a republican régime.

This *coup d'état* has been the occasion of a long debate in our press. The great public really cares for but one thing: it would like to be invited to hear good plays, whether ancient or modern. All the more recent plays have met with little success; they all dilate more or less on the question of divorce, and this subject, which was new a few years ago, before divorce became the subject of a law, is now thoroughly exhausted. It occasionally furnishes comical incidents in our light theatres, but its serious aspects have ceased to be a matter of interest.

Many of the newer comedies have shown a sort of timid imitation of the manner introduced some years ago by a bold and intelligent actor named Antoine in a small theatre which bore his name. It is not easy to translate the word "rosse," which has been given to this manner. The *théâtre rosse* has for its object to be absolutely realistic, to do away with all the conventionalities of the stage which have been admitted for centuries. It does not develop an action with the usual exposition and the necessary end of a plot; it means to give to the public mere "slices of life," and life is not made out of three, or four, or five acts—it goes on and leaves us at any time in suspense. It is not difficult to imagine why the first adepts in this new theatrical formula became very enthusiastic about it; it gave them absolute freedom, it made their work very easy, in many senses, as it did away with all complications and all intrigue. A new kind of acting, also, in harmony with it, was introduced. Actors and actresses sprang, so to speak, out of life; they needed no preparation, no long studies such as those of the Conservatoire; all that was asked of them was to be natural, to be faithful exponents of their own individuality. I will not deny that this return to nature had its advantages, that there was too much convention both in the creation and in the interpretation of theatrical works—the Théâtre-Français felt its effects in a certain degree; but, unfortunately, the new playwriters, while they attempted to get as near to life as possible, produced no plays of undoubted importance that could impress themselves on the public.

The famous theatrical critic Francisque Sarcey always protested against the introduction of an exaggerated realism on the stage of the Théâtre-Français. He protested, also, against the exaggeration of what is called the "mise en scène"—against the importance given to the material part of the theatrical art, the furniture, costumes, etc. The French Theatre receives a large subsidy from the state for no other object than to revive in each generation the best traditions of the past; it is bound to what is called the "répertoire"—a name that includes the classical plays, the masterpieces of Corneille, Racine, and Molière, to which have been added in our time the finest plays of Alfred de Musset and of Victor Hugo. An expensive "mise en scène" is quite unnecessary in such plays. When it becomes too operatic, it is even detrimental to the emotion of the audience. To please the eye and the ear is the privilege of the opera; the Théâtre-Français made its world-wide reputation by caring more exclusively for the pleasures of the mind. But the new realism has forced itself not only into the composition and development of the plays, but also into all the material accompaniments and surroundings of a plot. The Théâtre-Français would never, in old times, have played Sardou's "Patrie" as it is given now, at an enormous expense. "Patrie" was played, when it came out, at the Porte St.-Martin, but a theatre of the Boulevard can play the same piece a hundred, two hundred times in succession, and, if the piece is a success, the expenses of the "mise en scène" are soon repaid. The French Theatre is bound to vary its programme incessantly, and cannot afford to take the same risks as a private theatre.

Madame Sarah Bernhardt is just now playing Sardou's "Theodora" at her own theatre, and I am told that she has spent no less than 200,000 francs in the setting of this drama, which is a spectacle for the eyes more than for the mind. The Théâtre-Français cannot venture (or at least ought not to venture) such experiments; it ought to follow, more than it does at present, the sensible advice of Francisque Sarcey. The class of people who go to the Français care little for furniture, for costumes, for absolute exactness in all material details. Sarah Bernhardt made her reputation in the classical tragedies of Racine, which are ruled by the inflexible unities of Aristotle; the scenery did not change about her in every act; there were always the old temple, the naked walls, the cold hangings; she, and she alone, was enough. "Moi seul, et c'est assez." Whoever is so fortunate as to have heard her with her golden voice, to have seen her stand and move in the long draperies of *Phèdre* or *Andromaque*, will always remember her, and will care little for all the pomp and Oriental splendor with which she now surrounds herself in "Theodora."

It is difficult to prophesy what will be the end of the present crisis of the French Theatre. The actors and actresses who were members of the Reading Committee, just abolished, are partners in a sort of commercial society. They draw every year a certain sum, which might be called a dividend, out of the profits and outside of their salaries. This dividend, which, a few years ago, amounted to 40,000 francs for each of them, dwindled down to 12,000 francs last year. The burning of the Théâtre Français was in great part the cause of this diminution of profits, as many extraordinary expenses had to be met. The reports of last year's expenses and receipts are valuable documents which I need not analyze.

After all has been said (and there has been no end to the discussion on this subject), I willingly return to Voltaire's *mot* in 'Candide': " 'How many plays have you in France?' 'Five or six thousand.' 'It is much,' says Candide. 'And how many good

ones?' 'Fifteen or sixteen.' 'That's a great many,' says Martin." Good plays! there is the secret. Good actors will always be found, I venture to say, in France, which seems to have a peculiar genius in this respect, owing to centuries of peculiar culture. It is impossible not to be struck by the fact that in the meanest little theatres or even music-halls of the capital, and even of the large cities of France, you always discover some actor or actress with a special gift for acting. There is a whole populace of "cabotins," of both sexes, always looking for employment, always trying to get an engagement. It would be interesting, and sometimes very painful, to describe the career of so many men and women drawn by an irresistible calling to the hazardous life of the theatre. We know how difficult were the beginnings of some—of Rachel, for instance, the most illustrious of all; but nothing can deter many thousands, I may say, from the attraction of the stage. The demand for actors will always be answered by a supply. The same, alas, cannot be said of the demand for really good plays.

Correspondence.

CUBA AND IRELAND.

To the Editor of The Nation:

Sir: While our statesmen at Washington are debating what to do with Cuba, it will not be inopportune to recall a few well-known facts from the history of another island dependency.

Two centuries or more ago, Ireland, devastated by famine and war, lay at the mercy of England. The little energy that remained in her was turned to cattle-raising, which was as well suited to her by nature as sugar-raising to Cuba. The English landowners took alarm, and, by the 18 Charles II., c. 2, prohibited the importation of Irish cattle into England. This destroyed the rising trade. Ireland then turned to wool; but, by the 10 and 11 Gul. III., c. 10, this attempt was crushed by a still more sweeping prohibition. Smuggling began, and wool was carried to the manufacturers in France. Finally, the Irish turned again to their ancient manufacture of linen; but in vain, for the country had been crushed. Her poverty was irremediable and her despair final. By these measures England destroyed a possible market, stimulated her rivals, strengthened her enemies, blasted the hopes of a nation, and sowed the seeds of hate around the world.

For those who rely on the adequacy of free institutions, it is well to remember, also, that the commercial imperialism of the Whig ascendency was more grinding upon the colonies of England than the more generous absolutism of the Stuarts.

Yours truly, William P. Gest.

Merion, Pa., January 30, 1902.

THE BEET-SUGAR CASE.

To the Editor of The Nation:

Sir: The controversy between Cuban and domestic sugar being now at its height, it is curious to note the actual condition of public opinion throughout the nation. It must be admitted that the preponderance of opinion expressed in the leading journals can hardly be claimed as in favor of the just demands of domestic sugar-producers. There are several grave and obvious errors in the argument that constitutes the Cuban case, and the most important reasons for the establishment of beet sugar are not understood and are not presented—and perhaps never will be. One error, that of extravagant profits continuously enjoyed by cold-blooded producers of beet sugar, has now become less militant. The popular idea as to these profits and the cost of domestic sugar was an error, and could have been disproved by an examination of books; but it had great weight, and perhaps has now.

The claim is made every day that Cuban sugar will destroy no industry, and it is assumed that domestic sugar-producers in this country have a proposition of fixed and reliable factors, which enable us to say whether or not we can make money as the seasons roll along with a precision that is not possible to the foresight of mortal man. Actually, there is not one single critic of the position taken by domestic sugar-producers who is qualified to criticise their acts, and who would not in the same circumstances take exactly the same position that these producers do.

It is not true that the cost of sugar has admitted of extravagant profits, but, on the contrary, very little money has been recovered by investors in beet sugar in the way of dividends. If any profits have been made, they have been put back into the plant. The prospectus printed in newspapers all over the land, and scattered broadcast by the Sugar Trust, has conveyed an impression quite incorrect, and the result is simply a great mistake. Qualifying conditions, such as droughts, floods, and other misfortunes, have made the actual conglomerate experience of beet sugar widely diverse from the cheerful results indicated. Beet-sugar people have undertaken a task which involves a change in the fundamental conditions of agriculture, and the time and labor required have been underestimated in such degree as to make any prospectus appear absurd when checked up with actual results.

In spite of the phrase "No industry destroyed," the insincere motto of the Trust, a victory for Cuba means an early extinction of all domestic sugar, either in Louisiana or the North. A victory for domestic sugar means the gradual exclusion of foreign sugar till it forms an insignificant fraction of our consumption. The two are antagonistic, and one or the other must prevail. If we are beaten, the nation loses for ever its opportunity to secure in rural districts which cannot get other industrial life the most beneficent and valuable factor that we may ever know for education, improvement of agriculture, some degree of urban civilization, and fixing on the soil the owner who tills his own land. If we could now see clearly what beet sugar may accomplish, there would be no further discussion, and only our imperfect view of the future gives the Cuban argument any standing whatever. We have nothing but good will for the people of Cuba, and are willing that our Government shall make them any allowance necessary for their support; but we are not willing to build up their sugar industry at the cost of our own.

Yours truly, R. M. Allen.

Ames, Nebraska, January 27, 1902.

OUR NEW BELONGINGS.

To the Editor of The Nation:

Sir: It is interesting to note the variety of terms employed in current newspaper and magazine literature to designate the territory acquired by the United States through the Spanish war. Thus, the phrases "our new possessions," "our island empire," "our new territories," "our dependencies," "our colonies," and the like, are all in every-day use. None of these names is entirely satisfactory. For instance, *colonies* smacks too much of Imperialism, *dependencies* appears out of harmony with republican ideas, and so on through the list. Even the Government term, "our insular possessions," lacks greatly in precision, as we have one insular possession no farther away than across the East River.

In view of this, a specific name is desirable to describe the Philippines and Porto Rico, and such a term seems to have been provided for us by Judge Brown in the Supreme Court decision. The distinction between the different sections of the country he makes to hinge upon the clause "territory appurtenant and belonging to" the United States. Why not, then, assign to the word "appurtenants" of the United States the technical meaning intended?

Yours very truly, Jos. V. Collins.

217 Division St., Stevens Point, Wis., January 28, 1902.

CANADA AND ALASKA.

To the Editor of The Nation:

Sir: The present contention of Canada about the Alaskan frontier, which she brought up at the Quebec Conference in 1898, is that she is entitled to many outlets upon tide-water above fifty-four degrees forty minutes north latitude; and the possession of even only one such outlet on the Lynn Canal would serve her purposes admirably well. The United States, on the other hand, as Russia before them, have always maintained that (by Articles iii. and iv. of the Anglo-Muscovite Treaty of 1825), no matter whether the frontier pass over a certain mountain top or through a given gorge, yet it is at all points far enough inland to entirely cut off the British empire from all contact with tide-water above the Portland Canal, which debouches into the ocean at fifty-four degrees forty minutes. And this view of the United States has been supported in the past, and not so long ago either, by both the British and the Canadian Governments.

In the early course of the negotiations between Russia and England in the years 1822 and 1824, Sir Charles Bagot fought strenuously to keep open for Britain an outlet upon tide-water as far up above fifty-four degrees forty minutes as possible. But to all his propositions, including his last one that the frontier should pass from the southern extremity of Prince of Wales Island up through Clarence Straits, which wash the eastern shore of Prince of Wales Island, the Russians would not agree. And finally England, represented by Stratford Canning, yielded the point and agreed on the Portland Canal as a boundary. As to what sinuosity Count Nesselrode, M. de Poletica, and Stratford Canning meant by the Portland Canal, when they negotiated and concluded the treaty of 1825, may be seen by looking at Vancouver's chart, upon

which is marked clearly "Portland Canal." And the map of the "Northwestern Part of the Dominion of Canada," published by the Surveyor-General at Ottawa, in 1898, agrees with Vancouver and the United States as to where is the "Portland Canal."

In 1872 Sir Edward Thornton, acting on his instructions from the British Foreign Office, which was serving as the intermediary for the Government of Canada, proposed to Secretary Hamilton Fish the advisability of having a survey made of the territory through which the boundary ran, so that the frontier could be located exactly, and Mr. Fish thought well of the idea and said that he would urge Congress to provide funds for such a survey. At that time no mention was made of Canada's present claim, that she is entitled to the upper part of many or all of the fiords or sinuosities that cut into the mainland above fifty-four degrees forty minutes. On the contrary, the Surveyor-General of Canada, J. S. Dennis, in a written communication in 1874 to the Minister of the Interior of the Dominion, gave his opinion that it would be sufficient at that time to determine exactly the points at which the frontier crosses the "Rivers Skoot, Stakeen, Taku, Isilcat, and Chilkaht." He added further: "The United States surveys of the coast could be advantageously used to locate the coast line in deciding the mouths of the rivers in question, as points from whence the necessary triangulation surveys should commence in order to determine the ten marine leagues back." In addition, a United States Coast Survey map, certified to "January 16, 1878," by Surveyor-General Dennis, was published in connection with this letter, with the boundary line crossing the Skoot, Stickine, and Taku Rivers, ten leagues back from the coast.

In 1877 the Canadian Government, through the intermedium of the British Foreign Office, formally recognized that the *lisière* of Alaska shut off Canadian territory from access to salt water. The previous year, while taking a prisoner named Peter Martin, who was condemned in the Cassiar District of British Columbia for some act committed in Canadian territory, from the place where he was convicted to the place where he was to be imprisoned, Canadian constables crossed the Stickine River. They encamped with Martin at a point some thirteen miles up the river from its mouth. There Martin attempted unsuccessfully to escape, and made an assault on an officer. Upon his arrival at Victoria, the capital of British Columbia, he was tried and convicted for his attempted escape and attack upon the constable; and the court sentenced him. Our Secretary of State, Hamilton Fish, protested vigorously against this infringement of the territorial sovereignty of the United States in the Territory of Alaska. After an investigation into the facts of the case, the Dominion Government acknowledged the justness of Secretary Fish's protest by "setting Peter Martin at liberty without further delay"; and thus recognized that the Canadian constables who had Martin in their charge when they encamped on the Stickine thirteen miles up from the mouth of the river, were on United States soil, and so that Canada's jurisdiction in that region did not extend to tide-water.

A striking truth of what the best official geographers of the British Government thought was the true boundary, is "Admiralty Chart No. 787" of the British Admiralty, that gives the northwest coast of America from "Cape Corrientes, Mexico, to Kadiak Island." This was prepared in 1876 by F. J. Evans, R. N., published in 1877, and corrected up to *April*, 1898, only a few months before the opening of the Quebec Conference. On this chart of the British Admiralty, the frontier of the United States descends the one hundred and forty-first degree of longitude west from Greenwich, and then, advancing on the Continent, but passing around the sinuosities of the coast so as to give a continuous *lisière* of territory cutting off the Dominion of Canada from all contact with any of the fiords or sinuosities that bulge into the continent between Mount Saint Elias and the Portland Canal, the frontier is drawn to the head of the Portland Canal at about fifty-six degrees, and then down that sinuosity, striking Dixon's Entrance at fifty-four degrees forty minutes. *Thus the British Admiralty itself upholds the territorial claims held and maintained by both the Russian and the United States Governments.*

It is one thing to ask the United States to agree, as Mr. Fish was willing to do in 1872, to have a joint survey to examine the country in the interior in order to locate exactly where the frontier runs. But it is quite another thing to ask the United States to submit to arbitration their right to all the sinuosities of the coast in their *entirety* above fifty-four degrees forty minutes, and the unbroken strip of territory round these sinuosities, which Great Britain recognized, from 1825 to 1867, as a part of Russia, and, since then, until recently, as a part of the United States. The more the subject is examined, the more evident does it become that there is nothing in the proposition of Canada and England which the United States should refer to arbitration.

T. W. BALCH.

PHILADELPHIA, January 27, 1902.

[The argument must close here.—ED. NATION.]

UNIFORM MUNICIPAL ACCOUNTING.

TO THE EDITOR OF THE NATION:

SIR: Our City Comptroller, Hon. James H. Smith, has added Baltimore to the list of cities that have taken up the important subject of uniform municipal accounting. In his report, just published, there is a schedule of the receipts and expenditures of the city arranged according to the scheme suggested by the National Municipal League. This scheme distributes the receipts and expenditures of the municipality under the general heads of ordinary and extraordinary. In the case of receipts, the ordinary embrace income from taxes, licenses, and so on; the extraordinary, income from sales of property, issuing of city bonds, and the like. Ordinary expenditures embrace what are usually termed operating or maintenance expenses. Extraordinary expenditures are made for purchases of property, erection of public buildings, redemption of the public debt, and so on. It is the request of the National Municipal League that all city comptrollers and auditors will, as an appendix to their report, state the receipts and expenses of their respective municipalities according to the scheme suggested by the League, so that by actual experience and a comparison of results a uniform schedule may be adopted which will commend itself for use in all municipal reports.

In order not to trespass too much upon your space with an elaborate explanation, it is proper to add that all who may be interested in this important branch of municipal government may obtain information in detail from the Secretary of the National Municipal League, Mr. Clinton Rogers Woodruff, North American Building, Philadelphia.

JOHN H. BLACKLOCK.

235 EQUITABLE BUILDING, BALTIMORE, January 27, 1902.

AN EARLY ALLUSION TO OMAR KHAYYAM.

TO THE EDITOR OF THE NATION:

SIR: All lovers of Omar Khayyâm know that his early fame in the West rested on his ability as an astronomer rather than on those wonderful quatrains which breathe the *Weltschmerz* of our modern age. The burden of the song of the "tent-maker," as FitzGerald has given it to us, has become part and parcel of our literature. It becomes of interest, then, to trace the European knowledge of Omar as far back as possible. FitzGerald's teacher, Prof. E. B. Cowell of Cambridge, supposed that the earliest reference to our poet in the West occurred in the well-known passage in Thomas Hyde's 'Historia Religionis Veterum Persarum,' pages 498-500 of the first edition (Oxford, 1700). Here almost certainly is the first Occidental publication of any of his quatrains, the one which FitzGerald rendered,

"O Thou who burn'st in Heart for those who burn."

There is, however, at least one allusion to the poet which antedates the passage in Hyde by more than a century. Here, too, the reference is primarily to the astronomer, but his poetic talent is altogether unnoticed. The ancient calendar of the Persians had fallen behind on account of faulty intercalation, and a reform was necessary, as was to be the case with the Gregorian reckoning in Europe five centuries later. Accordingly, the old friend of Omar, the Sultan Alp Arslan, summoned to his assistance the eight most eminent astronomers of Persia, including the poet himself. Among Al-Khayyâmi's associates were two whose names are familiar to all students of the Orient, Avicenna, the Arabic Aristotelian philosopher, and the chronologist and historian of India, Al-Biruni. The allusion to the poet to which reference is here made is found in the work of the great Dutch scholar, Joseph Scaliger, 'De Emendatione Temporum,' page 304 of the Geneva edition of 1629 (first edition, Basel, 1593), and runs as follows in text and translation:

"In illa autem forma vaga anni Iezdegirdici difficile est id assequi, tam propter neglectum in anno Persico quadrantem, quam propter praegressionem aequinoctionum; ob eam rem, Imperator Corasan, siue Mesopotamiae, conuocatis peritissimis astrologiae viris curam noui anni instituendi delegauit. Imperatoris, qui id edixit et sanxit, nomen est, Albu Arsalan Elselegeuki Elhavvaraz, Muschahi Sultan Corasan. Conuenerunt ad edictum Regium octo praestantissimi viri, Omar Elhaiamu, Abu Hali, Hasan filius Haitham, Elbiruni, Abu Elvvapha, Elbuzgiani, Ellukari, Iudex iurisdictionis Elphakati, et Aben Sina, quem vulgo Auisenam vocant. Erat annus Christi Dionysianus 1079."

"Now, in that vague form of the year of Yezdegird [the old system of time], it is hard to secure this [an accurate calendar], not alone because the quarterday is neglected in the Persian year, but on account of the progression of the equinoxes as well. Therefore, the Emperor of Chorasan, or Mesopotamia, called the most skilled astrologers together and commissioned them to determine a new year. The name of the emperor who ordained and enacted this is Alp Arslan, the Seljuk al-Havaraz Mushahi, Sultan of Chorasan. According to the imperial mandate, eight most distinguished men convened, Omar Khayyam, Abu 'Ali, Hasan ibn Haitham, al-Biruni, Abu al-Vapha, al-Buzgi, al-Lukari, judge of the district of al-Fakat, and Ibn Sina, whom they commonly call Avicenna. It was the Dionysian year of Christ 1079."

Whence did Scaliger get his information? To this question I can at present give no answer. Very probably his source was some one of the numerous Arabic or Persian astronomers, many of whose works are even yet unprinted. Yet, whatever his authority, Scaliger's words, from what we know of the poet's life from Oriental writers, bear the stamp of credibility. So, as a contribution to Persian and to English literature alike, I have transcribed them from a work but little known to-day as an offering to those who, like myself, find consolation and new courage in the Rubâiyât of Omar Khayyâm.

LOUIS H. GRAY.

NEWARK, N. J., January 27, 1902.

THE MICROBE FORESHADOWED.

TO THE EDITOR OF THE NATION:

SIR: Chaucer long ago told us,

"Ther nys no newe gyse that it nas old";

and perhaps, in view of recent researches into the ætiology of diseases, the theory propounded by Samuel Foote in his comedy "The Devil on Two Sticks" (1768) may have interest. The President of the College of Physicians is delivering a lecture:

"Brethren and students, I am going to open to you some notable discoveries that I have made respecting the source or primary cause of all distempers incidental to the human machine; and these, brethren, I attribute to certain animalculæ, or piscatory entities, that insinuate themselves through the pores into the blood, and in that fluid sport, toss, and tumble about like mackerel or cod-fish in the great deep; and to convince you that this is not a mere *gratis dictum*, an hypothesis only, I will give you demonstrative proof. Bring hither the microscope! . . . Take a peep. . . .

"Those two yellow drops were drawn from a subject afflicted with the jaundice—What d'ye see?

"*Last.*—Some little creatures like yellow flies that are hopping and skipping about.

"*Hel.*—Right. Those yellow flies give the tinge to the skin, and undoubtedly cause the disease: and now for the cure! I administer to every patient the two-and-fiftieth part of a scruple of the ovaria or eggs of the spider; these are thrown by the digestive powers into the secretory, there separated from the alimentary, and then precipitated into the circulatory; where finding a proper nidus or nest, they quit their torpid state and vivify, and upon vivification, discerning the flies, their natural food, they immediately fall foul of them, extirpate the race out of the blood, and restore the patient to health."

W. H. B.

Notes.

Mr. Charles Evans, No. 1045 Pratt Avenue, Rogers Park, Chicago, sends us a rather effusive prospectus of his 'American Bibliography: A Chronological Dictionary of All Books, Pamphlets, and Periodical Publications Printed in the United States' from 1639 to 1820, inclusive. The first volume will extend to 1740. How many there will be in all is not stated, but the price of each will be fifteen dollars. Each will have indexes of authors, subjects, printers, and publishers. Seventy thousand titles are estimated. It is Mr. Evans's purpose to append to each title the auction value above ten dollars, so far as ascertainable. This ambitious enterprise is wholly private, and the launching depends on receiving 300 subscriptions.

One of the books now going through the University Press at Cambridge, England, is 'The Unreformed House of Commons: Parliamentary Representation in England and Wales, Scotland and Ireland before 1832,' by Edward Porritt, of Farmington, Conn. The first volume deals with the franchises on which the old House of Commons was elected; the changes which took place in the relations of members and constituents between 1295 and 1832; the incoming of the patronage system, and the relations between members and the patrons by whom they were nominated; the relations of the Crown to the franchise; and the organization of the House of Commons, its officers and procedure. The volume covers the old electoral and parliamentary systems of Scotland and Ireland and the Unions of 1707 and 1800. The work aims principally to show how the representation stood when Grey and Russell approached the question of parliamentary reform, and what causes had made reform necessary. It was written in this country, and the material for it has been obtained chiefly in American libraries. Macmillan will be the American publisher.

The two concluding volumes of the late Canon R. W. Dixon's 'History of the Church of England from the Abolition of the Roman Jurisdiction,' edited during the past year by the Rev. Henry Gee, D.D., will be published immediately by the Oxford University Press (H. Frowde).

The University of Chicago Press announces a series of "Contributions to Education," by Professors John Dewey and Ella Flagg Young of the University. "Isolation in the School," "Ethics in the School," "Types of Modern Educational Theory," are some of the topics.

The Grafton Press, 70 Fifth Avenue, is about to publish Chaucer's 'Nonnes Preestes Tale of the Cok and Hen,' with an introduction by William Cushing Bamburgh. The limited edition will be printed handsomely in black-letter. There will be four antique illustrations.

W. R. Morfill's 'History of Russia from Peter the Great to Alexander II.' is soon to appear with the imprint of James Pott & Co.

'Wireless Telegraphy,' announced by McClure, Phillips & Co., will contain Marconi's history of his epoch-making invention up to date.

In conjunction with Cassell & Co., A. Wessels Company will publish immediately 'Chinese Porcelain,' by Cosmo Monkhouse, with numerous illustrations.

D. C. Heath & Co. have undertaken a 'Workingman's English-Italian Language-Book and Reader,' to meet the needs of our Italian population.

'The Americanization of the World,' by W. T. Stead, is in the press of Horace Markley, No. 6 Vestry Street, New York.

Henry Harland's new novel, 'The Lady Paramount,' will bear Mr. John Lane's imprint, as will Mrs. Leslie Williams's 'Garden in the Suburbs,' 'The Book of Bulbs,' by S. Arnott, and 'Poems,' by Arthur Symons, in two volumes.

Charles Scribner's Sons have placed a prettily illustrated edition of Stevenson's 'Child's Garden of Verse' in their series for school reading. This will help confirm its lasting quality.

There was room for a new edition of the 'Memoirs of Major-General Heath,' for the original issue has long been out of print. But a new edition would call for careful editing, as the naïve narration of "our General" is very partial, and can hardly be appreciated at its worth without many notes or illustrations drawn from contemporary accounts. The material for these notes was to be found in the large collection of "Heath Papers," still in existence, and the Washington correspondence already published. Yet the editor (and publisher) of the volume before us, Mr. William Abbatt, has not availed himself of either of these sources of information and correction, and has been content with adding a few notes drawn from the army rolls, chiefly confined to identifying the officers named in the text. A very few letters have been added in the notes, but the one from Gen. Lee, mentioned in the preface as a remarkable one, cannot be found by the index, and must be sought without that aid. It appears on p. 85. While it is well to have the text of the Memoirs in this form of a limited edition, yet a very good opportunity of making it more valuable has been lost.

In connection with this reprint may be mentioned the same editor's 'Battle of Pell's Point,' which is an attempt to make a mere skirmish into one of the important battles of the Revolution. The effort is not successful, but the illustrations are of interest.

Of five volumes additional to the handsome "Versailles Historical Series" (Hardy, Pratt & Co.), four are given to the Memoirs of D'Argenson and the Cardinal de Bernis; the last, to the letters of Mademoiselle de Lespinasse. These translations, by Miss Wormeley, are literal enough to give one a definite impression of the original styles, and thus reflect the mild fatuity of De Bernis quite as faithfully as the passion of the enamoured lady. But we must note that the following sentence from Sainte-Beuve is hopelessly un-English: "Let us return to the general character of Cardinal de Bernis, whom I did not at first intend to take so politically nor in a manner so grave." From this to Du Maurier's Frankingle (or Inglefrank) is no incredible stride. And *stürm und drang* would hardly pass for German in a school exercise.

The name of Madame de Lamballe suggests to the ordinary reader little more than a dramatic page of Carlyle, or perhaps a stanza from Thackeray's "The Chronicle of the Drum." M. Georges Bertin's complete, though disjointed, narrative of the unfortunate noblewoman's life seeks to em-

phasize her estimable character and the unmerited tragedy of the close. An obvious literary defect of this work may be found in the too liberal use of quotations, which greater literary skill would have blended with the author's own text. The translation now offered by Miss Arabella Ward (Godfrey A. S. Wieners) is therefore creditable as successfully dealing with a more than usually refractory original. An appendix of historical notes is not unwelcome.

Mr. Norman Hapgood's 'George Washington' (Macmillan) deals mainly with the life of Washington down to his election as President, the years subsequent to 1789 being but briefly surveyed. In general plan and method of treatment the work suggests the "true biographies," several volumes of which have lately appeared. There is the same copious quotation from letters and journals, the same interesting emphasis upon details, and the same distinctly personal impression as in the well-known biographies by Ford, Curtis, and Fisher. Like those writers, too, Mr. Hapgood brings into prominence sides of Washington's character not commonly dwelt upon —his thoroughly practical and matter-of-fact mind, his mingled modesty and self-confidence, his outward show of courage and faith in spite of inward doubt and trial, and his conscientious devotion to the small details of private and public duty. The result is a presentation of Washington on his human side which, while at times somewhat painful to hero-worshippers, happily avoids the belittling manner into which this style of biography easily falls. As an illustration of Mr. Hapgood's skill in holding the balance true, we may instance his treatment of the brief period, on the eve of the Seven Years' War, in which Washington's ill-concealed desire for a military appointment was coupled with a determination not to accept an appointment save on terms as advantageous to himself as they were commensurate with the need of the colonies. The volume is attractively printed and bound, and the pictures, especially the reproductions of manuscripts, are well executed. We note an obvious misprint on page 8, where 1848 should, of course, be 1748.

'Memorials of William Charles Lake, Dean of Durham, 1869-1894.' edited by his widow (London: Arnold; New York: Longmans, Green & Co.), tells the uneventful story of one who was useful and prominent rather than eminent. Archbishop Temple writes that "he was a very able man" and "a very good man," and Canon Rawlinson calls him "one of the noblest and most remarkable personalities of our day"; but his sphere and fame were wholly Anglican. The portrait shows a fine, strong, kind face; the text seems to disclose a character safe, sound, and solid, one of the men who, short of individual greatness, go far to make up that of England. He was one of Arnold's boys at Rugby, and intimate with Stanley there and at Oxford, where he became fellow and tutor of Balliol, and held various University and governmental posts, and, as afterwards at Durham, did much ruling and reforming work. A High Churchman but not a Ritualist, he "had sympathies with the three different schools," kept friends with members of each, and opposed the persecution of any. His intimates were disappointed that he missed the great prizes as an undergraduate, and perhaps (though this is not admitted) that he made no more noise in later life; but he raised the University of Durham to honorable rank. His brief autobiography is eked out by letters, newspaper articles, etc., enough to make a goodly octavo, which is yet rather a thing of shreds and patches.

Dr. Edward J. Chinnock's 'A Few Notes on Julian, and a Translation of his Public Letters' (London: Nutt) is a modest booklet by a British scholar, of interest to students of the last pagan Emperor. One of the notes suggests that, as "all the accounts we have of St. George were written by his deadly enemies," perhaps he was not as black as he was painted.

The college student of to-day who should make mistakes in the choice of his college or the conduct of college life would not do so for lack of good advice. In 'The College Student and his Problems' (Macmillan) Mr. Canfield offers the counsels of one who has directed two Western universities and is now officially connected with a third in the East. The difficulty about this sort of book is that the student who might be the better for reading it is not the sort of person who could be induced to glance at its contents. Probably oral advice to collective gatherings of students in their first year is the only sort that will come home to the naturally shiftless or indolent among them. Mr. Canfield's warnings against the abuse of the elective system—which he aptly compares with dynamite as at once dangerous and useful—against too much athletics, and, finally, against the waste of those four precious years of opportunity are well reasoned and convincing. Perhaps he is too much inclined to give both sides of each question with such force that (as, for instance, in the matter of choosing between a university and a college) one is left with a more vivid impression of the difficulties involved than of his cautious solution; but it is well to have these questions carefully argued, and in any case one is likely to make a decision with a sublime disregard of advisers. In his appendix Mr. Canfield gives a useful table of the expenses of students at the thirty-one more important colleges and universities.

In 'My Host the Enemy, and Other Tales: Sketches of Life and Adventure on the Border Line of the West' (Fleming H. Revell Co.), Mr. Franklin Welles Calkins tells of real Indians and lifelike borderers a number of stories, ranging from indifferent to excellent. While by experience made master of his material, he frequently slights it, for some of the better tales are the merest framework, and disappoint by bareness and brevity. In the title story the narrator takes refuge from a blizzard in the tepee of hostile Sioux, who give him full measure of hospitality until the blizzard is past and he departs. Then the Sioux pursue and shoot at him for some miles. Here was opportunity for a fine story, but Mr. Calkins has so good an eye for dramatic situations that he neglects the stage business that helps them along, and shears the tale of half its legitimate measure. However, if we must have faults, brevity is a good one, and the bald style at least convinces of the veracity of the narrative. Mr. Calkins will do excellent work when he adds to his forceful way of driving on a story a little grace in embellishment. As a rule, we prefer prefaces to "forewords," but Mr. Calkins's few lines of introduction come well under the latter designation.

Among recent popular books pertaining to trees is one by G. Frederick Schwarz, entitled 'Forest Trees and Forest Scenery' (New York: The Grafton Press). The author discusses briefly some of the characteristic features of the forms of trees belonging to the broad-leaf and cone-bearing types, and indicates the relation of these features to their beauty. The influence of the undergrowth and of the climbing forms, the manner of attachment of the leaves, and other features, are considered in their relation to the æsthetic effect produced. Plainly the writer has studied trees and forests closely, and knows them well, although he really gives but little information in his book. He has rather concerned himself in accounting for the beauty of the forest by an appreciative examination of its component parts.

Granting the necessity of compressing so large a subject as the history of architecture into so small a compass as to be carried in a waistcoat pocket, Mr. P. Leslie Waterhouse's 'The Story of the Art of Building' (D. Appleton & Co.) is an admirable performance. It is evidently the outcome of much careful study, and shows a good grip of the subject. The relative importance of its several parts is well considered. Its very brevity forces it to pass so quickly from the work of one age to that of the next that the reader is not likely to weary for lack of change of scene. Beginning with the work of the ancient Egyptians, it moves rapidly through that of the Assyrians and Persians to the firm ground of Greek architecture, a safe point of departure for a journey through the many styles that have intervened between the time of Pericles and the twentieth century. The book will be of use to persons who desire some knowledge of the subject, yet lack opportunity to study the longer histories. To such it may be commended as a clear and reliable statement of well-ascertained facts. It would have been greatly helped by a more liberal supply of illustrations, and it has been distinctly injured by a chapter on Architecture in America added by the American publishers—a chapter bearing no proper relation to the other parts of the book, and greatly inferior to them in both its matter and its manner.

The fatherhood of God is usually regarded as the first tenet of modern theology; yet the Rev. W. J. Miller, in his preface to 'The American Church Dictionary and Cyclopædia' (Whittaker), would limit it by St. Cyprian's antique apothegm, "He cannot have God for his Father who has not the Church for his Mother." From this specimen brick one might construct, or anticipate, the entire edifice; but this is an undogmatic age, and the "dictionary" appropriately begins with Ablutions and ends with Zuchetto—which, the uninstructed may learn, is a skull-cap, black for priests, purple for bishops. "Doctrines" are indeed promised, as well as "facts, customs, and usages," but Atonement and Inspiration are not among the titles, and Apostolic Succession is judiciously stated to be "more of a fact than a doctrine." On the other hand, here is no lack of Vestments, Orders, Saints' Days, and the like; and here be such strange terms, for our enlightenment, as Antependium and

Proanaphora, which latter, we are told, should by rights be substituted for Antecommunion. The work is very much smaller and slighter than Mr. A. A. Benton's 'Church Cyclopædia' (1884), and others that have preceded it. One would not like to say that it is "laid level to the meanest apprehension," but it is apparently intended for a certain class of those who take their ideas from the sermon and the Sunday school (not graded). Deep thinkers and earnest inquirers would scarcely select Mr. Miller as a guide; yet there are many of him, and their audiences and following are large.

Mr. Lummis's very individual monthly magazine, the *Land of Sunshine*, published at Los Angeles, takes on a new name, *Out West*, with the first (January) number of its sixteenth volume. The change sounds like a topographical expansion eastward, in accordance with the proverbial eastward longing of the "Slopers," but the Pacific Coast will, we judge, be still the peculiar province of this periodical. An obvious expansion is in the bulk, which is a sign of prospering, and the ever abundant illustrations seem even more numerous than usual. For tourists ignorant or needing to be reminded of the building of a branch of the Santa Fé Road from Williams to the Grand Cañon of the Colorado, the editor supplies some fresh views from the Bright Angel trail, where the railroad company is about to erect a commodious hotel. They will pitch it, not on the very brink, which would be like a desecration and would soon make the marvellous prospect commonplace, but in a spot where there is no hint of the Cañon, any more than from the railroad. One cannot, therefore, says this racy writer, "sit on the veranda and expectorate into the gorge." The tourist will get the surprise which is so large a part of the emotion on looking down into this mountain-peopled chasm.

The *Library Journal* for January sums up Mr. Andrew Carnegie's gifts to American libraries in the year just closed, and makes the total $13,813,000. No section has been neglected. Richmond and Nashville, at the South, got $100,000 each; and the same sum went to Leadville, Col., Ottawa, and Winnipeg, Manitoba. The Braddock, Duquesne, and Homestead Carnegie libraries received a million, as did St. Louis; New York city, five millions; Detroit and San Francisco, $750,000.

Commissioner Swan's fourteenth report on the custody and condition of the public records of Massachusetts shows the good effect of a law recommended by him enabling towns to choose a clerk for three years instead of annually; but he now desires that this be made compulsory, for obvious reasons. He exhibits photographs of the seemingly hopeless roll of Stockbridge records before and after being bound in silk—a marvellous transformation. He has also a sadly amusing chapter on the vagaries of ill-equipped official copyists of the elder records.

The International Congress of Historical Sciences, which met at The Hague in 1898 and at Paris in 1900, will hold its third meeting at Rome during April, 1902. The Congress will consist of sixteen sections, including all the departments of historical science; and as the section on Mediæval and Modern Literatures is as yet unrepresented by American scholars, an American Committee, including Prof. C. M. Gayley of the University of California, Prof. Henry A. Beers of Yale, Dr. F. I. Carpenter of Chicago, Dr. J. E. Spingarn of Columbia, and Prof. H. A. Rennert of the University of Pennsylvania, has been formed (1) to interest the American public in the literary section of the Congress, and to increase its membership; (2) to obtain an adequate representation of American scholars in the section, so that European scholars may become more familiar with American work in literary scholarship; and (3) to consider the possibility of inducing the Congress to hold its next meeting, in 1904, in some American city. The membership fee of twelve francs should be sent to the President of the section, Prof. Francesco Novati, 25 Via Borgonuovo, Milan, Italy. This nominal fee procures the Publications of the Congress, and a number of important special privileges, including reduced rates on all the Italian railroads. All papers presented to the Congress will be printed in its Publications, and it is hoped that scholars who cannot be present in person will be able to send some original contribution to be read at the meeting of the literary section. Further information may be obtained from Prof. Novati, or from the Secretary of the American committee, Dr. J. E. Spingarn, Columbia University, New York.

The Association for Promotion of Scientific Research by Women announces that applications should be received before March first for the American Women's Table at the Zoölogical Station at Naples. For the summer of 1902 the Association offers the free use of an Investigator's Table at the Marine Biological Laboratory at Wood's Holl, Massachusetts, to any applicant who is eligible for the Naples Table, and who may desire the benefit of preliminary work at Wood's Holl. Application blanks and further information may be obtained from the Secretary, Miss Cornelia M. Clapp, Mount Holyoke College, South Hadley, Mass.

—In line with the interest in art and artistic improvement noticed in other of the February magazines, *Harper's* gives place to a sketch of the movement initiated nearly a decade ago by Eugene Broerman for the artistic embellishment of the cities of Belgium. This took the form of an organized society, "L'Oeuvre Nationale Belge," in Brussels, in 1894, whose object was "to clothe in artistic form all that progress has made useful in the public life," such as street signs, flag-poles, street lights, poles for electric railways, bridges, etc. Treated with contempt at first by the municipal government of Brussels, the "work" soon gained such general popularity as to command the respect and aid of both national and local authorities. Dr. Süring of the Royal Meteorological Institute, Berlin, gives an interesting account of the upper atmosphere, based on ascents made last July. He was accompanied in the first of these ascents by Dr. von Schröter of Vienna, and Mr. Berson, who had previously made very high ascents in Germany and England; on the second occasion he ascended with Mr. Berson alone. On the first voyage the physiological effects of height on the body were carefully noted, with the conclusion that the rarity of the high atmosphere in itself produces no material modification in the functions of the heart and lungs, as usually supposed, the difficulty with these organs being due solely to lack of oxygen. The height reached in this ascent was only 24,000 feet, but on the second voyage, with a good supply of compressed oxygen along, an elevation of 35,000 feet was registered, with a temperature of —40 degrees Fahrenheit. Dr. Süring discredits the height of 37,000 feet said to have been attained by Glaisher and Coxwell in 1862. The conclusion of Mark Twain's "Double-Barrelled Detective Story" seems to admit of its classification as an intentional burlesque on the overwrought detective tale.

—The fifth volume of the "Writings of James Monroe" (Putnams) begins with the termination of Monroe's futile negotiation with Canning on the affair of the *Chesapeake*. Curtly rebuffed by that minister, Monroe returned to America with a double grievance against the Administration, for he resented the appointment of Pinckney as a colleague, and he keenly felt the rejection of his English treaty. He at once took up the task of vindicating his course, and, after an explanation and reconciliation with Jefferson, fastened upon Madison as a proper object of his revenge. The labored defence outlined for political use is entirely characteristic of the writer, for he sought to defend Jefferson at the expense of the Secretary of State. From the "Republican minority," now hostile to Jefferson's Administration, he held aloof, yet conducted a campaign for the Presidency on his own behalf by personal solicitation and criticism of Madison. When Madison had won, Monroe asked Jefferson to send him on a mission to France or to England, the scenes of his diplomatic defeats. A refusal brings out a long account of the foreign relations of the United States, proving his ineptitude as to the broader aspects of the questions involved. He felt hurt that Madison did not call him to the Department of State, or place him at the head of the army, and rather resented a suggestion from Jefferson that he accept one of the governments of Louisiana. This period, from his return from England to the end of the war of 1812, places him in an unlovely light, that of a needy and undignified office-seeker.

—That Monroe had good cause to complain of the treatment accorded to him by Jefferson and Madison is true; but his portentously long expressions of his feelings make wearisome and unprofitable reading. Tazewell and Taylor were made the depositaries of his confidences, and a letter of thirty pages in print suffices for no more than a beginning of his grievances. Yet in these letters the Monroe of later years begins to appear. He is the conciliator, the politician who is to silence party strife. He believes the President should cease to be the head of a party, and blames Jefferson for abusing the power of removal in such a way as to perpetuate the Federalists' influence. He refuses to attack Madison's administration, and, exhibiting himself as a man who has suffered much, pleads with other malcontents for moderation and forbearance, such as he has himself shown. He reaps his reward. A short term as Governor of Virginia was followed by his appointment to the Department of State by the very man he had so bitterly been criticising for months. The war made his place

almost a sinecure, and he was eager to take a military command. As temporary Secretary of War he wrote some memorials on proposed campaigns, but disaster after disaster to the American army rendered it hopeless to experiment on the offensive. Eustis and Armstrong, Hull, Dearborn, and others went into retirement, and Monroe emerges with credit! We regret that Mr. Hamilton gives so few of Monroe's public papers, consigning the few printed to an appendix. They are essential to a proper understanding of his character.

—'Cavalier and Puritan in the Days of the Stuarts,' by Lady Newdigate-Newdegate (Longmans), has been "compiled from the private papers and diary of Sir Richard Newdigate, second Baronet, with extracts from manuscript news-letters addressed to him between 1675 and 1789." Compared with 'The Cheverels of Cheverel Manor,' published by the author some three years ago, this volume is less attractive in form and less striking in contents. The Cheverels of 'Mr. Gilfil's Love-Story' were Sir Roger and Lady Newdigate of Arbury in Warwickshire. Sir Richard Newdigate was also the master of Arbury, but in character and originality he falls far short of the later Sir Roger. His chief merit was that he had the taste "to employ Wren, Lely, and Grinling Gibbons in beautifying his home for posterity." His besetting sins were carelessness and extravagance, carried to the point of burlesque. One meets with such characters in 'Castle Rackrent,' and fiction does well to make the most of them, but it is not often in real life that one encounters a man who, after alienating a large number of inherited acres, can write in his journal: "And whereas I rose this morning £55,000 in debt, I shall go to bed without owing more than £4,000, and towards that I have £3,000 of the assignment, which will carry a perpetual interest three years hence. Blessed be God's holy Name." Many other entries in the same journal are naïve enough to be amusing, *e. g.*, the following under August 6, 1682: "This day I fasted as a revenge upon myself for sin, and pray'd fervently tho' little. . . . Troubled with toothache, cured with sack." Perhaps the largest ingredient of this compilation is furnished by the news-letters which Sir Richard Newdigate took and preserved. Every one is familiar with the character of such compositions and the degree of their reliability as material for history. Sometimes they are entertaining, often they are padded out with all kinds of gossip derived from the coffee-house or the writer's own imagination. Lady Newdigate-Newdegate's own part in the piece is well done, and if her present work falls below the level of 'The Cheverels,' that is the fault of her records. On the whole, this sketch of social life at the close of the seventeenth century is fairly interesting, though not important. It suggests in some ways the class of book which is prepared by Mr. John Ashton, but possesses greater unity and deals with persons of a more aristocratic type.

—Mr. F. B. Sanborn's 'Personality of Thoreau' (Boston: Charles E. Goodspeed) is his third attempt to describe Thoreau, and, although the briefest of them all, is the most satisfactory, mainly for the reason that it confines itself more closely to direct personal impression than the 'Life' of 1882 or the 'Familiar Letters' of 1894. We have at the outset a rejection of the too common notion that Thoreau was a deliberate copy, which only succeeded in being a caricature, of Emerson. Their minds were of one family, but of external resemblance there was little beyond that of the handwriting. Still, can Lowell and others have been so much mistaken here as Mr. Sanborn thinks? It is true, as he says, that it is difficult to copy Emerson, but it is less difficult to take on something of his form through vital sympathy; and what Brownlee Brown did, and John Albee has done more recently, Thoreau may sometimes have done without impeaching his originality and without justifying the least possible reproach. Mr. Sanborn's account of the Thoreau family is vivid, and has the accent of complete sincerity with its items of Mrs. Thoreau's social tartness and her husband's genial assumption of a worse defect of hearing than he had, in order to escape responsibility for the harsher sallies of her wit. Mr. Sanborn's earliest note on Thoreau's appearance remarked "a huge Emersonian nose," for which the wags held Thoreau responsible, and "his collar turned over like Emerson's." The character of his walks, which Mr. Sanborn shared, is distinguished from that of Emerson's and Channing's in a delightful manner. He did not trust his memory of natural appearances, but made his notes "with his eye on the object." Thoreau's singing of "Tom Bowline" is, perhaps, the most surprising of Mr. Sanborn's reminiscences. The most pathetic passage is that touching Thoreau's partial alienation from Emerson; the most instructive that on Thoreau's classical scholarship, "better than Emerson's, Channing's, or Hawthorne's," and not inferior to Lowell's, each judged in middle life. A book about Thoreau limited to five hundred copies seems a queer paradox, when one thinks of the unsold copies of 'The Week' dumped on the author's hands. This book is beautifully got up in every respect, but it is a pity that its cost will make it the collector's trophy, when it should be widely read. Why should not Mr. Sanborn treat Emerson, Ellery Channing, and Alcott in this concise and personal manner, and put the four studies into one democratic book? We do not advise the inclusion of Hawthorne, who, for all his Concord residence, was a spirit of another color.

—Those familiar with the Rapenburg and Stationsweg in Leyden will recall the familiar figure and handsome face of Prof. Dr. Cornelis Petrus Tiele, which, during the last five years, showed increasing signs of age and infirmity. Born on the 16th of December, 1830, at Leyden, most of his life (almost eventless from the point of view of the man of action) has been spent in his native land. After passing through the elementary schools, gymnasium, and university of his native city, he entered the Remonstrant Seminary at Amsterdam, and received his doctorate of theology after a paper of Annotations upon the Gospel of John. He served in the pastorate from 1853 to 1873, first at Moordrecht and then at Rotterdam. Called to be professor in the Remonstrant Seminary in Leyden, his inaugural address was on the Place of Ethnic Religions in the History of Religion, an address worthy to be called epoch-making. Four years later he was made professor of the science of religion in the University of Leyden, and his opening lecture was upon the Results of Assyriology for the Comparative History of Religion. Thenceforward he continued steadily his researches in theological science, producing those solid works on the comparative history of the Egyptian and Semitic religion and on Babylonian and Assyrian history which have been reproduced in several languages. He wrote many articles for the great encyclopædias in Dutch, French, and German, corresponded with many learned societies, and delivered in 1886 the Gifford lectures at the University of Edinburgh, which institution, like that of Dublin, bestowed upon him a doctor's degree. The American Oriental, Royal Asiatic, American Philosophical, and the London Biblical Archæology Societies, and the Society of Biblical Literature in America, honored themselves by bestowing honorary membership upon him. Dr. Tiele belonged to the Royal Academy of Sciences in Amsterdam, and had been decorated with the orders of Orange-Nassau, of the Netherlands Lion, and of the Belgian Eikenkroon of Leopold. His 'Outlines of the History of Religion,' published in 1888, has been translated into seven languages. Almost to the very day of his death at Leyden on Saturday, January 11, he was intellectually active and intensely interested in affairs, especially in South Africa. The Dutch newspapers are full of his praises.

NICHOLS'S LETTERS OF ERASMUS.

The Epistles of Erasmus, from his Earliest Letters to his Fifty-first Year, arranged in order of time: English Translations from the early correspondence, with a Commentary confirming the chronological arrangement and supplying further biographical matter. By Francis Morgan Nichols. Longmans, Green & Co. 1902.

This is the first attempt to translate the Letters of Erasmus into English in any systematic fashion. The more familiar ones, especially those bearing more directly on the life of the writer or of his contemporaries—such, for example, as the so-called Epistle to Grunnius, the Epistle to Prior Servatius, and those containing descriptions of Colet, More, and Froben—have often been done into English more or less freely. The rest have been exploited over and over again by biographers of Erasmus, and by all who have attempted to describe the civilization of the Reformation period.

Mr. Nichols, an English scholar best known by his edition in 1865 of Britton's 'Commentary on English Law,' has performed a new service, not merely by translating the letters, but by attempting to arrange them in a satisfactory chronological order. The present volume contains the correspondence down to Erasmus's return from Italy to England in 1509, and the editor holds out the expectation that he may, at no very distant day, put forth a second volume containing the letters to the outbreak of the Lutheran Reformation in 1517. That he has made substantial progress upon this second instalment is witnessed by the chronological Register published here and containing all the letters to 1517. It is greatly to be hoped that he will be able to fulfil his promise.

Of the two objects held in view, a sound translation and a usable chronological scheme, the second will have the larger interest for scholars. Down to the beginning of the eighteenth century the editors of the Letters, including Erasmus himself, had but the slightest regard to their arrangement. The chief interest was the literary, even the rhetorical one; and the historical, scientific side of the matter was left to take care of itself. The great edition of LeClerc in 1703-06 had at least the merit of bringing together all then available material and of suggesting the importance of an accurate chronology; but it came painfully short of its own requirements. It made a feeble effort here and there to correct some of the more obvious errors, but left more of these than it amended, and did not even attempt to establish any principle by which letters undated or wrongly dated could be referred to their proper places. Yet for two centuries this edition has served as practically the only source from which biographers and historians have been compelled to draw. In 1891 Dr. A. Richter devoted a doctorate dissertation to an attempt to fix the chronology of the letters as far as 1509, and was followed in 1896 by Dr. Max Reich, who attempted the same service for those between 1509 and 1517.

These are the sole modern predecessors of Mr. Nichols. He has utilized them without slavishly following them. His conclusions differ from theirs at many points, and he has generally given with sufficient clearness his reasons for his own results. It would be too much to say that he has laid down any precise leading principles which could apply even in a majority of cases. Indeed, any such laying down of principles must have resulted in immediate disaster. The vast correspondence of Erasmus, especially the early portion of it here under discussion, is singularly detached from the general movement of human life. There are but few points at which he can be corrected by reference to events well fixed as to chronology. His early correspondents are men whom he has illustrated rather than men who can throw light on him. It seems like a gleam in the darkness surrounding Erasmus's birth-year when we learn from him that he was a few months older than Colet; we consult the biographies of Colet only to find that they all fix his birth by reference to this same passage of Erasmus. So we are always in danger of the vicious circle. Yet it is by internal evidence of this sort that most of the points of attachment for a sequence of the letters have to be gained.

An obvious clue in many instances would be the reference in letters to the several periods in Erasmus's own life; but here again the limits of these periods have to be determined chiefly by the letters themselves. If we decide, for example, that he must have been in Paris between certain dates, it is clear that a letter dated from England in that interval is misdated as to either place or time. All this would be plain sailing if we were only quite sure of our first premise; but unfortunately much of this fundamental fixing of bounds is sadly like guesswork.

Mr. Nichols has evidently given great care to this part of his work. He has been obliged to read the letters thoroughly, because he has had to translate them—an advantage his predecessors have not always enjoyed. He has weighed his evidence bit by bit, carefully, and has in general used it with discretion. He has been modest in his claims to final accuracy, and pretends to no more than he has really accomplished, namely, to furnish to the student of Erasmus and his time a plausibly consistent scheme of his early life and correspondence. It is altogether probable that the future biographer of Erasmus, if he be writing in English, will accept Mr. Nichols's system as a ready-made device likely to be as nearly accurate as any he could construct for himself; but how far we are still from a result upon which independent inquirers working each in his own way are likely to agree, may be seen from a comparison of the registers of Mr. Nichols and Dr. Richter. The number of cases in which they agree in placing the same two letters in immediate sequence is about one in every five. Yet Dr. Richter's system, taken as a whole, has as much to recommend it as has that of Mr. Nichols. Each is simply the result of accumulated intelligent guessing on a great number of separate points. We do not think that the cause of historical learning would suffer greatly if either of these schemes were to be followed by future scholars. We simply point out that neither of them, nor indeed any other likely to be worked out by comparing them, can claim to have solved once for all the many knotty problems involved.

In regard to the translations themselves, there is much to commend. They are intended to include at least a portion of almost every letter, no matter how unimportant it may appear, and in so far the plan is to be praised. It is a matter of regret, however, that Mr. Nichols has not been willing to go a step further and to give us each letter complete, even if it were at the cost of somewhat lessening the luxury of type and paper. No editor can assume just what part of a work is going to prove "interesting" to his readers. It is the fatal English subjectivity again. If such a collection as this is of any use, it must meet a great variety of demands, and the only way to do this would be to give the letters entire and leave the selection to each reader according to his need. Mr. Nichols goes so far as to indicate generally by asterisks where he makes an omission. "But when it is immaterial, the reader is not troubled with these signs." In other words, the reader can never be sure that parts of a letter are not left out without any notice to him. Cases of this offence are happily rare, but they are of a piece with the suggestion that "the judicious reader will pass with a rapid glance over the Epistles contained in the two first chapters." How can the editor tell what the judicious reader will do? Certainly, the more judicious he is, the more he will prefer to use his own judgment in picking out what he needs for a special purpose. To take an example or two at random: A letter (No. 135 in Mr. Nichols's register), written to the Abbot of St. Bertin, contains a long account of a religious performance near Orléans, which is full of interesting matter for the student of popular superstitions. It is here omitted entirely. The well-known letter to the Princess Anna of Veere is given only in fragments, so that its value as a specimen of Erasmus's literary style is quite lost. It is true that it is made up chiefly of rhetorical turns and phrases, but this is precisely characteristic. It is a pity that the reader should be deprived of Erasmus's defence of Laurentius Valla as an author worthy the attention of good Christians (ep. 182), merely because to give it would have added another page or two.

The quality of the translation is excellent. Mr. Nichols has generally succeeded in giving the spirit of the original without sacrificing the quality of his own English. He has been willing to recognize that Erasmus was not always bent on cultivating the "grand style." Erasmus's Latin was a very flexible instrument. He could preach, philosophize, scold, beg, brag, whine, joke, or protest in it with equal skill, and it is the obvious duty of the translator to follow him in all his moods without fear of consequences. It may be thought even a shade too free when Mr. Nichols (p. 178) translates "manus enim manum fricat" by "caw me, caw thee," since "one hand rub the other" is what Erasmus said, and good English, too. Why say: "A horse that might be bought for an old song," when the writer said: "for a farthing (*obolo*)" (p. 181)? In his rendering of proper names, Mr. Nichols falls into some oddities through an excess of desire to be as English as possible. "Batt" is really no improvement on "Battus," and why "Gillis," when "Giles" is the usual English for Aegidius? But these are trifles. In the main we have here a thoroughly sound translation, even and accurate.

The running commentary accompanying the translations gives us the detail of the process by which the results embodied in the Register were obtained. It shows a long, patient, and careful occupation with things Erasmian in all their great variety. It is not free from conjectures—with such material no work could be—but in general the conjecture has some reasonable basis. The principle of arrangement is usually that the comment precedes the letter, but it sometimes follows it, and it is not always easy to bring together all the evidence bearing upon a given epistle. For this the typographical scheme is partly at fault, the paragraph of comment always looking as if it belonged with the preceding instead of with the following epistle. We venture to suggest for the second volume the plan of placing first the Register number, then the commentary, including the dates as given in the several editions and as corrected by the editor, and then the text. This would make each letter and its comment appear under one distinct heading. Further, we should be glad to be spared the utterly useless page-headings, and to have in their place something that would further the purpose of the book—perhaps the number of the chapter and letter on the *recto* and the headings of the sections of the Register on the *verso*.

We are especially indebted to Mr. Nichols for his care on points of geography. He corrects Mr. Drummond and others by placing the castle of Tournehem, not on the island of Walcheren, where the chief property of the Marchioness of Veere lay, but near Calais. He gives us bits of archæological reference which show careful information, presumably from personal inspection, regarding the scenes of Erasmus's early life. His bibliographical allusions are numerous, and generally useful in fixing some point of chronology. On the very delicate point of determining personal mo-

tives, Mr. Nichols is no more to be trusted than others. He takes Erasmus's own statements too readily at their face value, though, like all other editors, he feels how slippery they are. It is certainly odd that no letters from Battus have been preserved, but it is quite gratuitous to suppose that Erasmus destroyed them because he was ashamed of their style.

But, after all is said, the fact remains that this is the most important contribution of recent times to the subject of Erasmus. We look forward with interest to the appearance of the second volume.

SAINTSBURY'S EARLIER RENAISSANCE.

The Earlier Renaissance. By George Saintsbury. [Periods of European Literature.] Charles Scribner's Sons. 12mo, pp. xvi, 423.

In considering Professor Saintsbury's latest book, it is pertinent to inquire, after the manner of Gibbon's famous dictum, what the not unscholarly reader may expect to find in a volume dealing with European literature during the closing years of the fifteenth century and the first half of the sixteenth. These are the limits of his subject as defined by the author himself, and the *communis sensus* which he so often invokes may reasonably look forward to the solution of certain historical problems, and the exposition of certain important literary developments, which are most intimately connected with this particular period.

The fifteenth century in Italy is remarkable for the rise and development of a great movement connected with the revival of classical literature, which, while not immediately productive of great works of the imagination, bore fruit, in the next century, in the fields of creative literature, of speculative philosophy, and of natural science. The progress and influence of Humanism are among the most important facts in the history of the modern spirit, and an adequate account of them may be expected in a series which professes to be "a complete and continuous history" of European literature. The period of origin does not, indeed, lie within the province of the present volume, but, for the sake of unity and continuity, the author of the preceding volume on the 'Transition Period' has wisely left to Mr. Saintsbury the whole subject of humanistic culture, for exclusive and exhaustive treatment in his opening chapter, on "The Harvest-Time of Humanism."

Here the first disappointment awaits the reader. The chapter swarms with Latin poets and prose-men, from Politian, Folengo, and Johannes Secundus to Erasmus, Buchanan, and More; and, as a summary of the Renaissance accomplishment in Latin writing, it is interesting and satisfactory. But the history of Latin verse is not the history of Humanism, a movement which has formed and colored literary taste and fixed the scheme of higher training in schools and universities for centuries; a movement whose feeding-roots go deeper into the human spirit, and whose influence on modern literature and thought is of far vaster consequence, than the achievements of individual Latinists. Starting with the ideal conceived if not fully formulated by Petrarch, the philosophical historian of Humanism might have traced the initial spread of the ideal through Petrarch's disciples, such as Boccaccio, who initiated that fondness for patient and laborious scholarship which has permeated Germanic erudition; Luigi Marsigli, who founded the first learned society or academy; and Coluccio Salutati, through whose efforts Humanism was given rights, and an honorable position, in the state. Such an historian would have shown how the movement, gathering strength as it proceeded, devoted itself at first too exclusively to minute investigation and to servile imitation of classical antiquity; how it was then given critical direction and scientific method by such a man as Lorenzo Valla, the direct ancestor of modern German scholarship; how it was soon afterwards married to æsthetic taste in the work of a Politian; and how, finally, under the dictatorship of a Bembo, it was systematically grafted on the vernacular literature, and permeated popular taste. Perhaps Mr. Saintsbury's lack of the historic sense, and his well-known impressionistic methods of criticism, precluded the possibility of his giving an adequate survey of Humanism in this particular manner; but no justification can be found for a mode of treatment which gives three pages to Johannes Secundus, while indicating Filelfo by name only, ignoring the great influence of Bembo on creative and especially on critical literature, and relegating to a footnote Lorenzo Valla, "il più ardito novatore e il pensatore più originale del secolo," according to the latest historian of Italian literature.

In a volume dealing with the Earlier Renaissance, however, the reader may reasonably expect to find more than an account of Humanism in Italy. Through its influence the literatures of Europe first became infused with the modern spirit, and, through the influence of vernacular Italian, first assumed a definite literary form. In a history of this period it seems fair to demand through what channels these influences came, what were their immediate effects, and how finally they bore fruit. Here again the reader is doomed to disappointment; Italian influences are scarcely if ever considered, and some of the great names in the history of Transalpine Humanism, of English and French Hellenism, are conspicuous by their absence. What shall be said of a history of the early English Renaissance which does not even mention by name such men as Grocyn and Linacre, or William Lily and Dean Colet? What shall be said of a history of the French Renaissance which ignores such men as Budæus, the first of French Hellenists, Ramus, whose philosophical radicalism infuses his rhetorical treatises, Robert and Henri Estienne, the great publishers and scholars, Amyot, prince of translators, and a dozen others? It is no sufficient answer to say that some of these scholars left behind them no enduring works of literature for the historian to label and appraise. This is the basis of Mr. Saintsbury's impressionism, but the historian of literature is ever obliged to deal with men, like Dr. Johnson, like Sir Philip Sidney, whose personal influence far outweighs the value of their extant works. The movement inaugurated by Wyatt and Surrey is unintelligible without some account of its antecedent preparation by Grocyn, Linacre, and Colet; but as yet Early English Humanism has not received satisfactory treatment.

A third great factor in the history of this period is the revival of criticism. The recovery of Aristotle's 'Poetics,' joined with the critical spirit of Italian Humanism, produced in the sixteenth century a remarkable outburst of criticism, that first formulated those canons of neo-classical art which were to dominate European literature until the end of the eighteenth century. It is due to Mr. Saintsbury to say that his is the first history of the Renaissance to include a chapter on this important theme. But it must be added that his treatment, with some slight differences of judgment rather than of fact, is almost wholly, and confessedly, borrowed from a recent monograph devoted to the same subject. Aretino, perhaps the most influential critic of the Cinquecento, and Erasmus, as great in this field as in so many others, are discussed elsewhere in the book, but not in the chapter on criticism. Dr. Karl Vossler's interesting study in the *Neue Heidelberger Jahrbücher* (1900, X. 38 *seq.*) supplies the deficiency in the case of Aretino, but no satisfactory account of Erasmus as a literary critic has yet appeared. We trust that Mr. Saintsbury will see fit to supply it in the forthcoming volume of his monumental 'History of Criticism.'

The early Renaissance witnessed not only the birth of Humanism and Criticism, but also, as is pointed out in the preface, the beginnings of the modern drama. Here Mr. Saintsbury's accomplishment coincides more satisfactorily with the expectation of the reader. His account of the origins of the vernacular drama in Italy, France, Germany, and England is not without merit; but his survey of the artificial Latin plays of the sixteenth century is especially worthy of praise, as being without a prototype, at least in English, and as a most accessible and interesting introduction to an obscure subject.

Finally, the historian of the Renaissance must be tested by his judgment of the great authors and his interpretation of the great literary monuments of the period—the 'Orlando Furioso,' the 'Courtier' of Castiglione, the Sonnets of Michelangelo, the 'Gargantua' and 'Pantagruel' of Rabelais, the 'Colloquies' of Erasmus, the political and historical writings of Machiavelli. These are the tests of his critical judgment, as the former were of his historic sense; and, in either case, Mr. Saintsbury's virtues and shortcomings are sufficiently manifest. His deficiency in the latter regard and his contempt for all standards of taste make his criticism, in the end, merely and wholly a matter of individual impression. He cannot understand Machiavelli; he does not fully recognize the chief glory of Michelangelo's genius; he is blind to the high qualities of the 'Cortegiano'; but his fondness for Erasmus, and, above all, for Rabelais, is justified by some excellent, if not always very discriminating, passages of criticism. His is, after all, the method popularized by Swinburne's prose—the method of lyric rhapsody and Elizabethan vituperation. This we feel especially when (p. 80) he compares the "coarse and earthy partisanship of Luther, the sour fanaticism of Calvin, and the reactionary Machiavelism of the Jesuits," with the genial and urbane tone of Erasmus, which we miss only too often in his own pages. Considering his slipshod style, his barbarous coinage of words and phrases, his cocksure and arbitrary spirit, his bitter and narrow

partisanship, we are often tempted to echo his own words regarding the Revised Version (p. 249, note), and to think that in this volume, too, "the laity might surely be spared its frequently controversial alterations of sense and its generally hideous cacophonies of sound."

It were unjust, however, to part with Mr. Saintsbury on such bad terms. This, like all his other books, gives many evidences of a wider reading than is usually associated to-day with English scholarship; and the reader will find in it much valuable information difficult to find elsewhere. We have noticed several slight errors, or perhaps slips of the pen; *e. g.*, "Burckhart's *Deutsche Dichter der 16ten Jahrhunderts*" (p. 348) should be "Brockhaus's *Deutsche Dichter des 16ten Jahrhunderts*."

RECENT NOVELS.

The Imp and the Angel. By Josephine Dodge Daskam. Charles Scribner's Sons.

A Lighthouse Village. By Louise Lyndon Sibley. Boston: Houghton, Mifflin & Co.

A House Party. Boston: Small, Maynard & Co.

Margaret Warrener. By Alice Brown. Boston: Houghton, Mifflin & Co.

Marietta: A Maid of Venice. By F. Marion Crawford. The Macmillan Co.

There be children's books for children, and children's books for adults; children's books, too, there be which over the children's shoulders exchange mocking winks with the grown-ups, like Roman augurs. Miss Daskam's book does not belong to the first class, though, in saying so, we do not forget the historic shower of contradiction poured upon the unlucky reviewer who predicted that 'Alice in Wonderland' would appeal mainly to grown-up readers. A children's crusade was the sequel. We venture to call Miss Daskam's book a very engaging member of our second class. He who writes such an one, let him take great heed lest he fall into the third. Miss Daskam has escaped this peril nearly throughout. Her tales are full of simplicity, naturalness, fun, and charm, and no one of any age will be sadder for reading them. The illustrations are unusually pretty and suitable; the little hero Imp, in particular, winning his way straight to the affections.

'A Lighthouse Village' is an absolutely unpretending little book, its sketches made so slightly as often to seem mere note-taking. But, for all that, or because of that, there is excellent entertainment between its covers. The salt of a lighthouse is like no other salt in the world. Its savor penetrates these modest pages. When the lighthouse is on the New England coast, its local color has found a name. Mrs. Sibley has intimately felt both phases of her subject, and gives us brine and dialect, pathos and absurdity, with understanding, and for the most part in that pleasantest of all ways, the unannotated words of the actors. Her own appreciation of it all is kept in the background, leaving it naïve to a degree which, if it sometimes reaches thinness, yet always tinkles true. It is, furthermore, mainly cheerful, and that is much in a day when finding a book to lend an invalid is a baffling problem. Even an invalid will be willing to endure the few touching pages for the sake of elsewhere reading of the man who was "double peculiar," or of her who "often said to him as feelin' as I could, 'Was your wife's health mostly pretty good 'fore she died'?"

To know that a book of stories is published as a puzzle in authorship is to set the mind in a guessing attitude, and almost to "impossibilitate" (as Dr. Donne says) cool judgment of them as literary matter. Nevertheless it is the reviewer's office to forget the question "Who's who?" and to ignore the almighty-dollar issues of the answers. Renouncing the inclination to point out real or fancied indications of origin, he must leave it to a happier public to conjecture whether here lies the mark of the Churchill or there the trail of the Twain. The plan of the symposium is novel. Stories have been dramatized before this (and worms have eaten them), but it is a new venture to dramatize the story-tellers themselves and cast them for parts in a rain-bound house-party. Mr. Ford, who alone is unmasked, plays his part of introducer with as much lightness and ease as such a rôle can command. "Aunt Nancy's Annuity" we think the gem of the collection, while "Dawson's Dilemma," "Mother," and "A Surrender" excel, each in its way. Indeed, there is not one out-and-out dull story in the series, though some more than others must have served to reconcile the company to the return of fair weather.

Alice Brown's latest book has the merits and demerits of earlier work of hers noticed in these columns. But the former gain. The hold is firmer, the "Meredithyrambics" are fewer. 'Margaret Warrener' stands noticeable among recent minor novels. It convinces at sight of the writer's divining power as to human motives, her understanding of the blended weakness and strength that spoil lives, "quietly, without noise," as De Grignon says in the play, and of the tragedies that make noise and do not seem to spoil anything. The story is sufficiently interesting to float the human-nature study which constitutes the real strength of the book. It wavers from time to time, and taxes credulity, perhaps, in places, but not in a way to irritate. The scene lies in a metropolitan Bohemia (Boston, disguised by a gauze veil), where artists and writers work and play together. To enumerate the characters—poet, actress, painter, journalist—seems to be naming a hackneyed *dramatis personæ*, but these are no hackneyed types, nor are they often impossible. The greatly aspiring and self-renouncing Margaret may do incredible things, but she is not incredible. The essentially noble Brandon, with his "nine or ten masquerading selves," is the novelistic guardian angel in a form that is new from its very truth to his more complex side. Perhaps his shoulder-wings are something over-prominent for so human a creature, but he is delightful. The old doctor and his sister are guardian angels, too, whose big wings sit naturally, but they are kept within healthy mortal limits. The world must grow older and colder before it consents to part with the omniscient doctor in fiction. The millionaire, prospering on soap, but shipwrecked in stock speculations, though so familiar to the ear, moves here without exaggeration in fresh paths. Even the *ingénue*, the singer who has lost her voice, displays an unexpected originality of character when her crisis time occurs. The central figure of darkness, the woman journalist, "promoter," and converter of blood into copy, plays the vampire with such plausible gleams of altruism that it was no wonder she attracted and warmed the breadwinners whom she intermittently helped. The feeble, faithless Llandaff, like many other heroes of novels, seems hardly justification for such good red devotion as Margaret lavished on him. We find ourselves forced to take for granted his powers of "luring sirens out of the wave." Remembering Titania and Bottom, however, we say no more. The few pages of hospital experience are done with remarkable effectiveness. In fact, this writer shows a great power of getting quietly behind the truths of life, be they mental or physical, and pushing them forward through her pages into the prick of instant recognition. Even he who exclaims, "How unlikely!" is sure to add, "How true!"

The tale of a Murano glassmaker in 1470 affords Mr. Crawford one of his most characteristic opportunities. Venice of the past, Venetian color on land and sea, a touch of history, a hint of politics, a panorama of manners and fashions, the great glass-making art with its secrets and rivalries, a glow of costuming, a glitter of jewels, little shivers of fraud and conspiracy, a love-tale running rough just long enough to acquire an impetus for smooth sliding at last—these are the features of a pleasant tale pleasantly told. Mr. Crawford's intimacy with his period as ever conveys itself to the reader, who feels admitted to the inner circle of Venetian interests in the fifteenth century. His characters stand well apart in their several personalities spite of a tongue common to them all; for all, whether fair lady or gondolier, Doge, Dalmatian, Georgian slave, patrician of Venice, or Greek pirate, speak Crawford. He, as is his wont, writes as if he had taken to heart Lord Chesterfield's dictum that "everything should be done in minuet time." There is no "sick hurry" in these well-conducted pages. Here one may enjoy history, millinery, and blood-curdling in good form and with gentlemanly leisure.

Richard Wagner, his Life and his Dramas. By W. J. Henderson. G. P. Putnam's Sons.

Great as is the number of books on Richard Wagner, Mr. Henderson has succeeded in adding one to the list which occupies a place of its own. He has studied the wants of opera-goers, and has endeavored to meet them all in a single volume of 504 pages. He has "told the story of Wagner's life, explained his artistic aims, given the history of each of his great works, examined its literary sources, shown how Wagner utilized them, and set forth the meaning and purpose of its principal ideas." Though much condensation was necessary in telling the story of Wagner's multitudinous adventures in 153 pages, the author has succeeded in making these chapters entertaining, by careful selection of the more important episodes. He has made good use of the materials supplied by various predecessors, but in some cases missed the chance of improving on them by utilizing interesting disclosures made in letters of Hans von

Bülow and Liszt, in Wagner's letters to Heckel and Wesendonck, and in Weissheimer's volume on Wagner, all published in recent years.

Mr. Henderson's estimate of Wagner as a man and a composer has undergone considerable change since he first began to write about him. Familiarity with biographic facts and with the operas has bred more and more admiration. At one time inclined to side with the peculiarly shallow estimate of Wagner's personality made by Jullien, he now assumes a much more sympathetic and yet judicial attitude. While setting forth on one page his foibles more clearly than any other biographer has done, he shows in the chapter on "The Character of the Man" a deep insight into Wagner's mind and the causes that shaped his attitude toward the world. If Wagner "possessed the gentle art of making enemies as few other men could, yet he was highly successful in gaining friends, and those whom he got he kept." By way of accounting for Wagner's irritability, Mr. Henderson might have dwelt more on the hostile criticisms which constantly ruffled his temper. But, after all, his disappointment was caused less by these direct attacks than by "the failure of the world to grasp his ideals." The author believes that this disappointment would have continued had he lived longer. "Even now only a few ardent lovers of the loftiest things in art have entered fully into the spirit of his conceptions."

A unique feature of Mr. Henderson's book is a full record of first casts in the case of every Wagner opera, in both Europe and America. In the latter case the records could not be made quite complete because the journalists of twenty-five years ago "did not realize their obligations to posterity." However, this is no great calamity: the missing names were probably of fifth-rate singers. A clear account is given (pp. 77-79) of the Praeger-Ellis controversy. Exception may be made to the statement (p. 118) that "Tristan und Isolde" "never was really *sung* until within the last half-dozen years." Vogl sang the rôle admirably; and how about Wagner's idol, Schnorr? Mr. Henderson himself supplies evidence in a footnote, ten pages further on, that Schnorr had a beautiful, sweet voice, and that "he approached in his singing the manner of Jean de Reszke."

In commenting on the music of Wagner's operas, the author follows the sensible plan of printing some of the leading motives in musical type, but not all of them; and he properly emphasizes the fact that while it is an advantage to know these motives and their significance, one can enjoy Wagner's music without having them all by heart. But the most important feature of Mr. Henderson's book is that he everywhere champions Wagner's idea that "the play's the thing," and the music merely its illustration and intensification. He has a thorough appreciation of Wagner's originality and power as a poet. Many opera-goers, perhaps, do not care much about the sources of the poems which underlie their favorite works; but they cannot fail to be interested in Mr. Henderson's comparisons showing how, in every case, Wagner, the dramatist, improved on his poetic predecessors. Concerning the "Flying Dutchman," he says justly: "He ceased to be a mere libretto-writer, and became a dramatic poet. His version of the famous old legend is a lovely one, and much of its increased beauty is the product of his own genius." Concerning "Tannhäuser" Mr. Henderson goes so far as to maintain that the music commands less admiration than the book. He "wrote no mightier tragedy than this." Tannhäuser's narrative "is the climax of power in the opera, one of the most intensely tragic pieces of writing in all dramatic literature." In the case of "Lohengrin" the reader is shown act by act how skilfully Wagner used his borrowed poetic themes, and made them dramatic by ingenious improvements. The author sees the true humor of "Die Meistersinger," and says regarding the great Tetralogy: "His reconstruction of the story of the end of the gods, of their release from the burden of sin by a voluntary, vicarious sacrifice, raises the poetic issue of his drama to a plane far above the conceptions of the old Norse and Teutonic skalds. With 'Der Ring des Nibelungen,' in spite of its defects, Wagner set himself beside the Greek dramatists." But it is for "Tristan" that Mr. Henderson reserves his most glowing enthusiasm:

> "As is invariably the case, his treatment of the story draws together all the beauties of the original material, and moulds them into a compact, consistent whole, instinct with dramatic force and poetic beauty. In attempting to set forth the Wagnerian arrangement of materials, I find it difficult to proceed coolly and systematically. There is a witchery in this marvellous drama of fatal love that masters my mind. . . . 'Tristan and Isolde' is a drama of human emotions, uttered in tones. As such it must be conceded a place among the mightiest conceptions of the poetic brain."

A History of Architecture in Italy, from the Time of Constantine to the Dawn of the Renaissance. By Charles A. Cummings, Member of the Boston Society of Architects, Fellow of the American Institute of Architects. With nearly five hundred illustrations. In two volumes, pp. xix, 314; ix, 325. Boston: Houghton, Mifflin & Co. 1901.

Mr. Cummings's book is one of descriptions, full, careful, minute, of a great number of Italian buildings. It is composed as if intended to be published without illustrations, or with few illustrations; and, as there are 462 pictures, most of them half-tones, it happens rather often that the reader is told in words, at some length, what the photograph shows sufficiently well. A certain farther elaboration of the text might have caused the verbal and the pictured account of the building to work together for enlightenment with a more perfect harmony of purpose. Apart from this there is no fault to be found with the descriptions, as such. They are long enough, but not too long, and their relative length is well proportioned. As the description flows on, the doubtful points are well stated, with a shrewd discrimination between the probable and the wholly unsettled. The Tomb of Theodoric at Ravenna has greatly interested the author, and he devotes to it two pages of text with three cuts, and here the serious uncertainty that exists with regard to the original form and character of that unique building is perfectly well stated. In all this there is only one more point to make as to less satisfactory quality, and it is as follows: When, as on pages 254-5 of volume i., the exterior of Saint Mark's is in the way of being described, it is an obvious omission that "the lion of St. Mark on a blue ground of mosaic" and "the ogee gables [in itself a faulty phrase] decorated with wildly extravagant crockets" and the general effect "of indescribable strangeness," are not mentioned as accessories of much later date than the mass of its chief details, and as all apart from the original design. It is, of course, well that the description of the church *as it is* should be given fully; one could even wish that the church as Ruskin and other enthusiasts saw it in 1850, or even in 1870, were contrasted with the less fascinating building of the days since the late restoration; but what is especially needed here is something more than any one description, and the successive additions of the eleventh, fourteenth, and succeeding centuries need to be discriminated.

The book is thoroughly in sympathy with the nobler works of the art it deals with, as with the humble efforts of the beginners. This sympathy would not be perfect were it not for the author's readiness to see and recognize what is strong, what is original, what must have been very novel in building. Even in the case of perfectly well-known monuments, this readiness to look into the essence of the thing and to note the brilliancy of one and another design of long ago is most remarkable, and on this account, very largely, the book seems to be almost all that the general reader on subjects of fine art could possibly require. Indeed, the only change which, from this point of view, it is seen to require, is a little more attention to references from one passage to another, in description or in criticism.

The Soverane Herb: A History of Tobacco. By W. A. Penn. London: Grant Richards; New York: E. P. Dutton & Co. 1901.

How men first came to smoke tobacco is not known; but two things are clear: that the practice was originally a religious rite, and that it was brought in the sixteenth century from America to Europe, whence it spread to Asia. All three modes of using the weed—cigars, pipes, and snuff—were found in vogue among the natives by the earliest discoverers. In the narrative of the first voyage of Columbus, we are told of the astonishment of the Spaniards at seeing the natives of San Salvador puffing cigars, or rather enormous cigarettes. On his second voyage, the islanders were observed snuffing the powdered leaf through a hollow cane. On the mainland, pipe-smoking was the universal custom, but still retaining much of a ritualistic character. So tobacco went to Spain as cigars, to France (through Jean Nicot) as snuff, and was carried to England with the pipe by Ralph Lane, Governor of Virginia, on his return in 1586. Raleigh, though he adopted the practice, was not (as is often stated) its introducer. England gave it to the Dutch, and the Dutch carried it to the Spice Islands and farthest Cathay, so that, almost before the century closed, tobacco had girdled the world. Not, however, without opposition. King James's futile crusade against the weed had no effect except to stimulate poets like Jonson, Ford, Sylvester, and smaller fry to curry court favor by satirical abuse of smoking

and smokers. Shakspere never alludes to the practice; and his silence may be interpreted either way. Sultans, shahs, khalifs, and czars put forth their might against it, and Pope Urban launched a bull against its use, but all in vain; the frail, withered leaf was stronger than popes and kings.

As Mr. Penn has omitted the famous anecdote associated with this bull of Urban's, we venture to retell it, old as it is. On the publication of the bull, a paper was found affixed to the statue of Pasquil, containing the text: "Contra folium ostendis potentiam tuam, et stipulam siccam persequeris?" (Job, xiii, 25). Urban made proclamation that, if the author would declare himself, he should receive reward. On the next morning the pasquil was found signed "Job."

Despite both spiritual and secular fulminations, tobacco held its own, and even —what few monarchs have done—conquered the Church. The present Pope takes snuff, the finest in the world, which is specially made for him in Baltimore. But fashions in tobacco-taking, as in other things, have varied. In the eighteenth century the pipe sank in reputation in England, and the snuff-box arose. On the Continent, snuff had always been aristocratic, and leaders of fashion had rivalled each other in the costliness and beauty of their boxes, the exquisite flavor of their contents, and the grace with which the pinch was inhaled. England never quite attained these high levels of elegance, and in the nineteenth century went back to the cigar. The Crimean war brought in the cigarette, the use of which the English had learned from their allies, and in late years the pipe has come once more into favor.

The forms of pipes are bewildering in their variety, but, for simplicity (and we might almost say sublimity of conception), that of the Bechuanas surely bears the palm. The native, wanting a smoke, selects a patch of damp clay soil, on which he lays a slender switch and packs clay over it, after which he draws out the switch, and the pipe is made. All he has to do is to burn some tobacco over one end of the tunnel, and apply his mouth to the other. The favorite pipe at the present day seems to be the brier, made from the root of a species of heath growing on the shores of the Mediterranean. The wood has a beautiful grain and color, imparts no taste to the smoke, and is practically incombustible. Smokers who have fine briers will do well to cherish them, as our author tells us that the supply will be exhausted in ten years. The meerschaum is the aristocrat of pipes. The material is a fine magnesian clay found in Asia Minor, and the pipe must be carved from the natural block, after which it is treated with various fatty substances which produce the mellow brown tints dear to the smoker. Vienna is the headquarters of the manufacture, though its birthplace is at Pesth, where the coloring effect of wax was accidentally discovered more than a hundred and fifty years ago.

The finest and costliest tobacco in the world is grown in a very limited district in Cuba. According to Mr. Penn, not more than 30,000 cigars of the very highest grade are turned out every year, to be the luxury of kings and millionaires. A dazzling prospect, however, is offered us by a German chemist who has discovered that the flavors of tobaccos are produced by microbes associated with the process of fermentation, and that, by proper inoculation, he can give the vilest *mundungus* the aroma of the choicest product of the Vuelta Abajo.

Both those who use and those who abuse tobacco will find entertainment and information in this little book, from which they may rise either with livelier gratitude for the bounties of nature, or with keener regrets at the perverseness of man.

BOOKS OF THE WEEK.

Austin, Mary S. Philip Freneau, the Poet of the Revolution. A. Wessels Co. $2.50.

"Worthy to rank with Lewes' 'Life of Goethe,' . . . written charmingly, . . . brightened with kindly humor and wise comment."—*Chicago Evening Post* on

Thomas's Schiller.

With photogravure illustrations. 12mo, $3.25 *net.* (Postage 21c.)

Henry Holt & Co., New York

The Failure of Success.

A Novel. By Lady Mabel Howard, Author of "The Undoing of John Brewster." Crown 8vo, $1.50.

LONGMANS, GREEN, & CO.
93 Fifth Avenue, New York.

The BOOK for PRINCE HENRY

A little episode, interesting to the literary world, occurred recently in Berlin. Prince Henry of Prussia called at the American Embassy to discuss with Ambassador White his projected tour in the United States of America. His Highness is keenly interested in being well posted beforehand. In the course of his visit the Prince was recommended to peruse the standard handbook by Bryce, and was urged to read also

THE LAND OF CONTRASTS

By James Fullerton Muirhead

New Edition. 12mo. $1.20 net

Being "A Briton's View of his American Kin."

The author is well fitted to write on American Life and Customs, being a much "travelled" man, whose wife is a member of a well-known Boston family. Indeed, his book is gallantly dedicated "To the Land that has Given me what makes Life worth Living."

JOHN LANE, 67 Fifth Avenue, New York

The JESUIT RELATIONS and ALLIED DOCUMENTS

JUST COMPLETED

by publication of the two large Index Volumes, one of the most extensive indexes ever issued in the country. It makes available for the first time in history this immense mass of archæologic, historic, biographic, geographic, and ethnologic material.

Of the edition, strictly limited to 750 numbered sets, over seven] hundred have been subscribed.

Only 48 Are Unsold.

Every Important Library should secure this set of books before it is too late.

Address the Publishers,

The BURROWS BROTHERS Co.
Cleveland, Ohio.

JOHN FISKE

"We have lately lost a very distinguished example of the teacher not only of history but of morals, and of the vital connection existing between the two. . . . What a splendid monument he has left! . . .

" . . . The true historian must be a philosopher, and if a philosopher, then an inquirer into moral tendencies, into the great drift and trend of national life. . . . We are too apt to take up the study of history in mosaic fashion, here a bit and there a bit, quite carefully worked over and prepared, but without any idea of how it fits together."—CAROLINE HAZARD, President of Wellesley College, in the *School Review* for December, 1901.

Fiske's History of the United States for Grammar Schools. $1.00, *net.*

Fiske's Civil Government of the United States for High Schools. $1 00, *net.*

ANNUITIES.

If applied for promptly, I can supply a limited amount of absolutely safe life annuities on exceptionally favorable terms.

If at all interested in this, the only conservative way of securing a high rate of interest, send age and address and receive full particulars. EDWARD F. SWEET, 66 West Broadway, New York City.

MATTHEW ARNOLD IN THE "NINETEENTH CENTURY."

"The New York NATION—a newspaper which I read regularly and with profit, a newspaper which is the best, so far as my experience goes, of all American newspapers, and one of the best newspapers anywhere."

THE NATION

an independent weekly journal, was established in 1865. Its contributors include the most prominent names in literature, science, and art, both in this country and abroad. It is emphatically found in the homes of people of culture and refinement. No intelligent American, desirous of keeping abreast of the best political and literary thought of the day, can afford to be without it. Subscription price, $3.00 a year, postpaid.

The Nation

VOL. LXXIV—NO. 1911. THURSDAY, FEBRUARY 13, 1902. PRICE TEN CENTS.

APPLETONS' SPRING BOOKS

SUNDAY LEGISLATION

Its History to the Present Time and Its Results. By Dr. A. H. LEWIS. New Edition, Revised and Enlarged. 12mo. Cloth, $1.00 net; postage, 10 cents additional.

In view of the discussion regarding the observance of Sunday, and the arguments pro and con the opening of saloons and the recognition of various forms of recreation, it becomes peculiarly important to know the exact status of American sentiment as defined in our laws. The appearance of this new edition has a special timeliness in New York, and it is believed that there is no other volume which summarizes this important subject in a form so succinct yet comprehensive.

APPLETONS' LATIN DICTIONARY

Revised by J. R. V. MARCHANT, M.A., Wadham College, Oxford, and JOSEPH F. CHARLES, B.A., City of London School, formerly Merton College, Oxford. 122d thousand, Edition of 1901. Crown 8vo. Cloth, $1.50.

Prepared especially for students of classical Latin; hence, a large number of archaic or post-Augustan words have been omitted. It is sufficient commendation to say that in the revision the invaluable Dictionary of Professor Georges has been followed.

The First Volume in Appletons' World Series

BRITAIN AND THE BRITISH SEAS

By H. J. MACKINDER, M.A., Student of Christ Church, Reader in Geography in the University of Oxford, Principal of Reading College, Editor of Appletons' World Series; or, the Regions of the World. With numerous Maps and Diagrams. 8vo. Cloth, $2.00 net; postage 19 cents additional.

Each volume in this most important new Series presents a great region of the world. The volumes picture these regions as stages of human action, and they illustrate the relations of man to the grand features of physical geography.

The first book is by the editor, one of the best equipped geographers in Great Britain. It is a broad, comprehensive review of the position of Britain and the characteristics of the British seas; the structure of the islands, their physical history, weather, climates, racial and historical geography, etc.

BOOKBINDING AND THE CARE OF BOOKS

A Handbook for Amateurs, Bookbinders, and Librarians. By DOUGLAS COCKERELL. Illustrated. The first volume in the Artistic Crafts Series of Technical Handbooks, edited by W. R. Lethaby. 12mo. Boards, $1.20 net; postage 8 cents additional.

With the growth of book collecting and large libraries and the increased attention given to the garb of books, there has arisen a demand for practical and simple information regarding the dress of books which this clearly written and useful volume will supply.

THE STRENGTH OF THE WEAK

A Novel. By CHAUNCEY C. HOTCHKISS, author of "Betsy Ross," "In Defiance of the King," etc. 12mo. Cloth, $1.50.

The delightful outdoor quality of Mr. Hotchkiss's novel forms a charming accompaniment to the adventurous happenings of the romance. The diary of a soldier of the New Hampshire Grants and the situation of an English youth holding a seigniory in Canada at the beginning of the French and Indian wars provide a variety of dramatic incident.

An Educational Directory.

SCHOOL TRUSTEES, PRINCIPALS, TEACHERS, and others interested are invited to consider the advantages offered by *The Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism *The Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the inteiligence of the country, *The Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The advertising rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

Orders may be forwarded through any responsible advertising agency, or directly to

BY THE AUTHOR OF "PAOLO AND FRANCESCA," "HEROD," ETC., ETC.

ULYSSES

Bound in Cloth, 16mo, **$1.25** *net* (postage 8 cts.); Japanese vellum, large paper, **$5** *net* (postage 10 cts.).

The new play just produced in London by Beerbohm Tree, of which it is said:

"It is the most imaginative production the present generation has witnessed."
—DAILY EXPRESS, London.

"There are some haunting lines of beautiful verse which fix themselves in the memory."
—DAILY TELEGRAPH, London.

"His work is packed with dramatic imagination from end to end."
—RICHARD LE GALLIENNE.

THE PRINCIPLES OF WESTERN CIVILIZATION

By BENJAMIN KIDD,
Author of "Social Evolution" and of "The Control of the Tropics," etc. Cloth, 8vo, $2.00 *net.* (Postage, 13 cents.)

A prominent conception here is that not past conditions alone, but the efficiency which looks toward the future, is the controlling element in the evolutionary process throughout life.

A HISTORY OF POLITICAL THEORIES, ANCIENT AND MEDIAEVAL

By WM. A. DUNNING,
Professor of History in Columbia University, Author of "Essays on the Civil War and Reconstruction," etc.
Cloth, 12mo, $2.50 *net.*
(Postage, 18 cents.)

A LIFE OF NAPOLEON I.

By J. H. ROSE, M. A.,
Author of "The Revolutionary and Napoleonic Era. 1789-1815." Illustrated.
2 vols., 8vo, $4.00 *net.*
(Postage, 35 cents.)

THE SCENERY OF ENGLAND; And the Causes to which it is Due.

By the Right Hon. LORD AVEBURY (SIR JOHN LUBBOCK).
With many illustrations and maps. Cloth, 8vo, $2.50 *net.*
(Postage, 20 cents.)

ELEMENTARY ELECTRICITY AND MAGNETISM

By **D. C. JACKSON,**
Professor of Electrical Engineering, University of Wisconsin, and **J. P. JACKSON,**
Professor of Electrical Engineering, State College, Pennsylvania.
Illustrated, cloth, 12mo, $1.40 *net.*
(Postage, 15 cents.)

Ready Shortly

THE MASTERY OF THE PACIFIC

By A. R. COLQUHOUN, F.R.S.,
Author of "China in Transformation." With forty full-page half-tones and 100 drawings in the text. Cloth 8vo, $4.00 *net.*
(Postage, 20 cents.)

A trenchant and exhaustive account of the development, history, and present status of the Far Eastern countries and of *our* present and future relations to them.

THE STORY OF THE MORMONS

By WILLIAM ALEXANDER LINN,
Sometime Managing Editor of *The New York Evening Post.*
Illustrated with facsimiles of plates from the Golden Bible.
Cloth, 8vo, $4.00 *net.*
(Postage, 21 cents.)

A SHORT HISTORY OF GERMANY

By **ERNEST F. HENDERSON, A.B. (Trinity), M.A. (Harvard), Ph.D. (Berlin),**
Author of "A History of Germany in the Middle Ages," etc.
Cloth, 8vo, two vols., $4.00 *net*
(Postage, 24 cents.)

Books published at NET prices are sold by booksellers everywhere at the advertised NET prices. When delivered from the publishers, carriage, either postage or expressage, is an extra charge.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 13, 1902.

The Week.

Senator Platt of Connecticut has removed any remaining doubt as to the securing of reciprocity with Cuba through the early action of Congress by this brief statement of his position:

"I am a protectionist, and have been so much so that I have been called a partisan. I am as strong a protectionist now as ever, but I believe that proper and reasonable tariff concessions can be made on Cuban products in return for Cuban tariff concessions on American products, which would greatly benefit the trade of both countries and not appreciably injure any American industry. I think the cause of protection is being wounded now in the house of its professed friends, and that the free-trader cannot injure the cause of protection as much as protectionists who insist upon unreasonable and unnecessary customs dues."

The significance of this declaration does not consist alone in the fact that Mr. Platt has always been a strong protectionist, and that he comes from a State whose tobacco-growers are making an earnest protest against any tariff concessions to Cuba. Mr. Platt is not only a Republican of the high-tariff school, representing what has been a high-tariff commonwealth, but he is also one of the half-dozen most influential leaders in the Senate, and in this capacity his support of Cuban reciprocity is of the first importance. Moreover, it may safely be taken for granted that Mr. Platt does not speak for himself alone as a leader in his body, but that Allison, Aldrich, Spooner, and the other men who usually control the action of the upper branch, have reached the same conclusion as to this burning issue.

The significance of Mr. Platt's statement, however, is not confined to the question of Cuban reciprocity. What he says on the broader issue of tariff revision is equally important as a sign of the times. This veteran New England protectionist sees and admits that the pending question is not simply one of doing justice to Cuba, or of promoting better trade relations between the two countries. He perceives and confesses that the whole cause of a protective tariff is involved, and that the high-tariff people who oppose concessions to Cuba are endangering the very duties upon which they depend for protection against imports from the rest of the world. The shrewd Connecticut Senator realizes, more clearly than some of the other protectionist Senators and Representatives from the East, that there is a sentiment in favor of tariff reform among the Republicans of the Middle West which cannot safely be defied. He understands that Congressman Babcock's insistence upon some reductions in the present rates is no personal eccentricity of the Wisconsin member, and that the support given to his scheme in the Ways and Means Committee by Congressman Tawney of Minnesota was not a bid for notoriety; but that these Representatives really represent their constituents in this matter, and that the people are in no mood to be trifled with.

While the Cuban medicine is working in the Committee of Ways and Means, another and larger dose of tariff reform is working in the House. The Babcock proposal to repeal or reduce the duties on steel and iron has taken a fresh start since it was offered in the Committee and failed by only one vote. Mr. Babcock now says that, if he could bring it to a vote in the House, it would pass by three to one. If this be true, or if it be true that it would pass by any majority, large or small, then the difficulty of getting it before the House is only a question of time. Chairman Payne is said to have warned Mr. Babcock that, if he did not stop his agitation, the Committee would "go up into Wisconsin and take the duty off lumber." Mr. Babcock is reported to have made a very hot reply in the committee-room. The answer he makes in an interview with the New York *Times* correspondent is as follows:

"I don't care whether he takes the duty off lumber or not. That is a threat that has no terrors for me. That won't hurt Wisconsin. The people who are going to make trouble, if the duty is taken off lumber, live in Pennsylvania and Maine, especially the hemlock people in Pennsylvania. If Mr. Payne makes that threat good, he will be hurting the East, not the West."

It will be a very cold day when Mr. Payne and the people he represents adopt the policy of retaliation on Mr. Babcock and his friends. The cause of tariff reform would be pushed forward many miles by such a falling out, and the gain that it would make would be permanent, and not fitful, as it was in 1890-94. It has often been said that the tariff ought to be reformed by its friends. There are now some signs that this saying may come true.

"Let us consider everybody damned," said the bishop to profane Lord Melbourne, "and pass on to the business in hand." So one might say to the Senate, after the promiscuous hanging which—by tongue only—was indulged in by that body on Thursday. "Let us consider everybody a traitor for whom hanging is too good, and get on to the real pith of the Philippine question." That continues to cry out for attention, no matter how skilfully Senators Hoar, Tillman, and Foraker may leave each other dangling from a metaphorical or logical gallows. It is highly indicative, however, of the changed temper of press and public that such outcries in the Senate, such frank admissions of technical treason by Senators, and such fustian as that of Foraker's about our troops never returning except "victorious," arouse no excitement. The people are, in general, languid about the whole affair. They have unmistakably grown weary of the old ranting on the subject, and have reached the "psychological moment" when a fresh and vigorous leadership in a new direction will appeal to them powerfully. This is the opportunity which President Schurman and Senator Hoar and the other advocates of justice to Filipino aspirations are seizing, and of which they are making such excellent use that the tardy *ipse dixits* of Gov. Taft are quite thrown in the shade.

Secretary Shaw's letter to Congressman Sulzer on the subject of deposits of public money in banks is an encouraging step forward in the pathway of rational finance. In reply to an inquiry from Mr. Sulzer, he says that a computation made in the Treasury Department by direction of Secretary Gage shows that, if the Government had deposited its surplus funds over and above a working balance of $30,000,000 in national-bank depositories without bond security, but requiring the payment of interest at 2 per cent. on quarterly balances, there would have been no loss; but that, on the other hand, there would have been a gain to the Government of $32,000,000, and that the banks of the country would have been enabled to extend $200,000,000 of additional accommodation to borrowers. This is on the presumption that the Government had a prior lien on all the assets of the banks. No change is required in the existing law in this particular. The Government's prior lien on the assets of failed banks has always been a feature of the national bank system. Now Secretary Shaw endorses the principle of depositing surplus money in the banks at interest without bond security. His predecessor, Mr. Gage, had never gone so far in his public deliverances, but it was known that privately he favored this policy, and it is quite clear that he paved the way for the step which Secretary Shaw has taken.

It is safe to say that public opinion will sustain the proposed measure, and that the only disputes likely to arise will be in reference to details. A bill introduced by Congressman Pugsley of New York provides that the Secretary may in

his discretion deposit with national banks having a capital of not less than $100,000, and a surplus of a like amount, such portion of the surplus funds in excess of $30,000,000 as may from time to time be in the Treasury. These deposits may be made without requiring United States bonds as security, but shall not exceed to any one bank 50 per cent. of the combined capital and surplus of the bank in which the funds are so deposited. It is contended by some authorities of high rank that no money should be deposited on these conditions in banks having a less capital than $500,000 and a surplus of like amount. This contention rests upon the belief that the small banks are more liable to become insolvent than the large ones. If this were a fact, it would not be a conclusive argument in favor of drawing the line at the figures named. It would still be necessary to show that the Government, with its prior lien on assets, would incur loss by such failure—which is a quite different proposition. It is not true, however, that small banks are proportionately more liable to failure than large ones. The statistics of the national bank system show that the proportion is about the same above and below the $100,000 line.

The report of the Industrial Commission has not yet reached the public, but a synopsis of its recommendations has been put on the wires from Washington. Among other things which the Commission proposes is an annual franchise tax to be imposed by the Federal Government upon all State corporations engaged in interstate commerce, calculated upon the gross earnings of each corporation from its interstate business. The minimum rate of such tax is to be low, but the rate is to increase gradually with the earnings. Accompanying this is a recommendation for a bureau of publicity in the Treasury Department, the duties of which shall be to register all State corporations engaged in interstate or foreign commerce; to secure from such corporations all reports needed to enable the Government to levy a franchise tax with certainty and justice, and to collect the same; to inspect the business and accounts of such corporations, and to ascertain whether the corporations are following the law; to enforce penalties against delinquents, and to collate and publish information for Congress. These recommendations, if carried into effect, will put the Trusts and combines under the same kind of inspection as the railroads are now subjected to by the Interstate Commerce Commission. An additional suggestion is made that another commission be appointed to inquire into the practice of some protected manufacturers of selling their goods at lower prices abroad than at home, and to report what concessions and duties may be made without endangering wages and employment at home. Considering the amount of testimony taken on this very subject by the Industrial Commission itself, and the amount of time consumed by it, great surprise will be felt that it has not made up its own mind, instead of referring the matter to another body which, if appointed and clothed with the necessary authority, may take two or three years more to reach a conclusion. The public mind is ripe for considering this subject now.

In default of any recommendation concerning tariff-protected Trusts, Mr. Phillips of Pennsylvania, an ex-member of Congress, and a member of the Commission, makes a minority report that has some spirit in it. He scouts the idea of turning this question over to another commission, and recommends that the tariff on metals be at once removed or greatly reduced, as provided in the Babcock bill, and that the same principle be applied to ores, wood pulp, spruce logs, and other raw materials which are in limited supply, and therefore subject to monopoly. The duty on iron ore, for example, is 40 cents per ton, and more than 80 per cent. of the ore beds of Lake Superior are already monopolized by the Steel Trust. It is impossible to suppose that Congress needs any more information than it already possesses in order to legislate on this subject. The recommendation to adjourn the question till another commission can be organized and can take testimony and make a report, can have no other effect than to prolong the present conditions. Mr. Phillips gives us some new and important information respecting railroad discrimination in favor of large shippers, showing how the small producer is crushed, not by the superior facilities of the large one, but by unjust and unlawful rebates on transportation given to the latter. These rebates are still given to the Standard Oil Company, as of old. Specific instances are cited which show that individual refiners are entirely excluded from large sections of the country by preferences given to the Standard Company by railroads, and that the officers of the roads, when questioned on the subject, lied about it in the most brazen way.

That was an extremely illuminating picture of the inside condition of the noble Republican party of Brooklyn which was drawn by the witnesses in the Guden hearing before the Governor at Albany on January 28. A Sheriff who bargained away all his receipts above $12,000 and all the offices at his disposal, and then repented of his bargain and tried to sneak out of it; a boss who demanded and secured the right to name the candidate for Sheriff after only one or two feeble protests, and then dictated terms to his creatures; an under-sheriff who tried to bribe a confidential secretary to betray her employer—these were some of the most interesting figures of the day. One witness testified that he had demanded at least three offices for himself, although only a member of the County Committee, and had indignantly spurned the offer of the chief clerkship. The virtuous under-sheriff, it seems, tried to plunder Mr. Dady's safe, and told his superior that he would like to wring the shrieval neck. The worthy and right honorable Sheriff would seem to have played fast and loose with everybody. If any one ever had any doubts about the standing and character of the Brooklyn Republican organization under the leadership of Woodruff, Worth, and Dady, he must be relieved of them now. Its own members have stamped it as being on a par with Tammany Hall in the character of its leaders, in its aims, and in its conduct in office.

An admirable feature of our revised charter is the provision which allows the head of any administrative department to occupy a seat in the Board of Aldermen, and authorizes him to participate in its discussions; and which also requires him to answer all questions put to him by any member relating to the affairs of his department, provided he has received forty-eight hours' notice of the questions to be put. The new system received its first illustration on January 28, when the Street-Cleaning Commissioner appeared at the regular meeting, and explained to the Aldermen the condition of that department and the urgency of its needs. The whole situation was thus at once made plain in a way which would have been impossible if the Commissioner had not been able to plead his own cause. So far as we can recall, this is the first time that the principle of giving department heads the right to speak in a legislative body has been applied in this country, and the workings of the new system will be watched with great interest.

First it was the Coroner's jury which found the New York Central guilty in the matter of the tunnel disaster. Now the State Board of Railroad Commissioners, after careful investigation, declares the Company to have been guilty of gross negligence. The next step will be the action of the grand jury, which may be expected to go a step further and fix the responsibility upon some of the officials. Should these again escape with mere censure, the offence of criminal negligence should be removed from the State's statute-book. Although some experts do not think the tunnel signals up-to-date, the Commissioners pronounce them of the best. There will be no dissent from the various common-

sense recommendations of the Commission, that the blocks should be increased in size, the signals raised to the level of the engine-cab windows, the use of anthracite coal enforced, and the station-yard immediately improved and enlarged. The Commission recognizes the impossibility of making the tunnel an open cut, which would best solve the trouble, but sees no difficulty in operating the tunnel with electricity, and recommends that the railroad be authorized by the Legislature to change its motive power. In every respect the report is judicial in tone, well within the facts, and a credit to the Commission.

The recent request of the Fine Arts Federation to the Mayor for the appointment of a commission to regulate the laying out of the city under a comprehensive plan, needs only to be understood to be favorably received. At present the borough system makes such a plan difficult, but the centralization of this power, through an amendment to the charter, should be easily obtained. The Fine Arts Federation appeals for a better and more intelligent planning of the newer parts of the city. The older part, says Mr. F. S. Lamb, the well-known architect, in an interview, can never be thoroughly done over, but the city can and should do something in providing new squares, and in supervising carefully the designs for the many bridges which must eventually span the Hudson and the East River. Private enterprise, too, can do much to relieve the situation. Property-owners far-sighted enough to combine to make a new Gramercy Park would probably realize upon their investment. The long blocks might be broken by north and south streets, like Astor Court. The suggestion that private initiative may in part remedy the early mistakes of the city government, and do so at a profit, is both novel and interesting.

Professionalism in the larger Eastern colleges is at an end with the action of Columbia in replacing a paid football coach with the captain of last year's team. This change confirms a movement of several years' growth. The more thoughtful graduates and the advisory athletic committees have long contended that college teams should be coached only by amateurs, and preferably by graduates of the college. It is no reflection upon the whole class of college players who have taken up paid coaching to say that these professionals have often made a mystery of their trade where mystery was none; have countenanced questionable methods of making up a team and of play, being naturally more desirous of proving their own competence by a victory than of maintaining the traditions of gentlemanly sport. Some or all of these evils must necessarily follow professional coaching. One need not argue that nobody is so likely as an alumnus and an old player to cherish scrupulously the honorable traditions of a college. It is this sense of representing the college in sport, and of being bound by all the obligations of gentlemen and sportsmen, that is more than winning championships. Columbia is to be congratulated on ranging herself with this sentiment, and it is to be hoped that the smaller colleges, where professional coaching is still common, will generally follow this lead.

Declined with thanks, was precisely the answer which Lord Lansdowne should have given to the Dutch peace proposals, and he made this response with every expression of good will to the Dutch Government and of humane intentions, both to the Boers in the field and to their delegates in Holland. The incident could have had no other ending. Premier Kuyper had absolutely no authority to speak, either for the Boer guerrillas or even for the representatives of the Boer republics in Europe. The British Foreign Office could not possibly have dealt with him on those terms. Lord Lansdowne was right, too, in maintaining that no binding negotiations are possible now except in South Africa. Botha and De Wet are to be reckoned with, and the rest count for next to nothing. Lord Lansdowne, however, expressed his willingness to hear the Boer delegates, and generally his note might have pleased Lord Rosebery for a certain "passive" peaceableness of tone. Technically, the Dutch are left in the awkward situation of an intermediary who is discovered to have no principal; but practically one must feel that matters look somewhat better for peace in the near future. All will concur in the hope of certain English journals, that subsequent peace negotiations may be conducted through the Foreign Office rather than through the Colonial Secretary.

Kitchener's block-house system had its crucial test last week, and partially failed. After manœuvring for many months, he had De Wet's command fairly caught between three lines of block-houses and an armed cordon holding a line forty miles long. It was precisely the advantage, in view of which the block-house system was established, and theoretically Kitchener, who directed the operations in person, had only to advance the mobile side of his square until he had the Boer leader caught between his fire and that of the block-house line. It was a well-matured plan, which appears to have been executed faultlessly except in the main article of bagging De Wet. The fault here was apparently not Kitchener's; the meshes of his net were too large, and the Boers slipped through with considerable loss, to be sure, into the new and larger block-house quadrangle between Winburg and Lindley. The failure of the campaign shows that, while the block-house lines are an embarrassment to the enemy, they are not strong or closely built enough to prevent the passage of small bodies of Boers. Nor is there any likelihood that England will give Kitchener men enough to make these lines impassable. Short of that, it will take many months or some piece of extraordinary good luck to catch any of the Boer leaders, and the dispersion of the enemy into smaller commandoes will probably only exacerbate the guerrilla phase of the war.

It is impossible from the dispatches to measure the extent of the English army scandals. One would suppose that the devoted British officer had been effectively "brayed in a mortar." The remounts revelations show that that drastic process is, as King Solomon observed, in certain cases unavailing. The food-contracts scandal is of far uglier aspect. In a word, the contracts for provisioning the army were sublet many times, and always at a profit, until they reached the sphere of commercial influence of Mr. Cecil Rhodes. Even the ultra-Tory *Saturday Review* admits that the Government has been swindled atrociously, and the British taxpayer, who is fairly used to attacks upon his pride, will resent with double bitterness this attack upon his pocket. It is edifying to imagine the tirade upon the corruption of vulgar republics which would have enlivened the *Saturday Review* if the food-contract scandals had been not British, but American.

That colonial expansion and trade expansion are by no means convertible terms was strikingly shown on Friday in the Reichstag by Herr Richter, the Radical leader. He proved from official statistics that there are but 3,762 Germans, including officials and missionaries, in the colonies; that each colonist costs the Empire 6,000 marks a year; that if colonial trade has more than doubled (from 11,000,000 to 25,000,000 marks) in the past five years, during the same period colonial expenditure has nearly trebled (from 7,000,000 to 19,000,000 marks); finally, that the apparent increase in exports to the colonies was chiefly due to Government and military supplies—quite as the case was found to be in the Philippines—and so was actually a charge upon the home country. When it is remembered that in these same five years Germany has confirmed her standing as one of the greatest exporting Powers, the "trade follows the flag" axiom, which had already begun to bear a damaged look, will need no further refutation.

CUTTING THE PHILIPPINE KNOT.

We have now entered on the fourth year since, by ratifying the treaty with Spain, the United States acquired a bloody war in the Philippines, and apparently embarked on a permanent career of conquest and empire. But at no time within the three years have the signs been so clear as to-day that the country is about to pause in that mad course, to listen again to the older voices which have given us our national watchwords and marching orders, and to turn back, all in good time, to the path from which, in an evil day, it unwittingly wandered. That promise is now bright in the sky for those who have watched steadfastly for its rising, without bating jot of heart or hope. They may now be more confident than ever that the nation of their love and pride will not be compelled, by stupid persistence in a mistaken policy in the Philippines, to

> ——"drain the bitter dregs of woe
> Which ever from the oppressed to the oppressors flow."

"The Americans," said an English newspaper recently, in disgust at what it thought the unmanly whining of certain Englishmen about the war in South Africa—"the Americans have been fighting a guerrilla war in the Philippines for three years, but they are not saying anything about it." Oh, but they are! They are, in fact, saying more about it just now than for a long time past. That is the most hopeful element in the present situation. Free discussion has reasserted itself; and all that liberty and justice ever asked is an open debate before open minds. The former terrorism which would impose silence on freemen in America, lest their speech should make freedom seem to men in the Philippines a thing better worth struggling and dying for—that folly is overpast. Representatives speak their minds without rebuke. Senator Money snubs Senator Beveridge to the delight of the galleries. The Opposition Senators have formulated a deliberate policy looking to ultimate withdrawal from the Philippines—and no one wants them hung for treason. We have recovered the right of free speech on that subject, and it is being freely exercised. That is one of our enormous gains, after three years of a war about which, it was said, no patriotic American would lisp.

Another great gain is the final discrediting of the leaders who induced Congress to take the mad Philippine plunge. Their prophecies are so ludicrously falsified that it would be cruel even to recall them. Their expectations have fallen to the ground. Their golden phrases have turned to ashes in their mouths. "Gems and glories of the tropic seas," was President McKinley's grandiloquent description of the islands. From that to President Roosevelt's blunt characterization of them as "a great burden," is a long distance. It is the distance between the cocksure elation of 1899 and the universal disappointment of 1902. Not even Beveridge, not even—to go to a lower depth of silliness—not even Secretary Wilson, would dare to repeat to-day their first glowing predictions of the wealth which was to flow to us from the Philippines. No one now denies that we have already flung away millions there which will never yield us a return. The only question to-day is, not how to get our money back, but how to get our honor back.

We cannot do it, clearly, by further accepting the leadership of the men who have to acknowledge that their policy has been one long series of calamitous mistakes and forecasts brought to naught. "Yes, it is true," say in effect Lodge and Beveridge and Foraker and the others, "the thing has not worked as we thought it would. The ratification of the treaty, the sending of more troops, the dispatch of the first Philippine Commission, the recall of Gen. Otis, the supersession of Gen. MacArthur, the giving the chief command to Gen. Chaffee, the appointment of Gov. Taft, the capture of Aguinaldo—none of these things, we admit, has resulted as we confidently hoped and positively predicted. But"—and this is the amazing, the illogical inference they draw—"our policy is the right one, and if you only keep on trusting us, after all our blunders, we shall surely, take our word for it, bring you out right in the end." This is new and strange doctrine. The American way has been to change a policy which has proved itself a failure, not to stick to it doggedly and count upon "floundering through somehow." Our people are not in the habit of letting themselves be twice led into the ditch by blind leaders of the blind; and we do not think they mean to begin it now.

There is an old English saying, "They have tied a knot with their tongue which they cannot unloose with their teeth." It aptly describes the plight of the framers of our Philippine policy. The knot has got to be cut, and there is just one way to do it. An official proclamation by the President of the United States, authorized by Congress, assuring the Filipinos that we intend to acknowledge their independence, and leave them to work out their own destinies, would at once insure peace with honor throughout the archipelago. About this we discern a strange hesitancy in many minds. Gov. Taft, for example, speaks of independence as a thing to be contemplated possibly, but not to be mentioned now. Others whisper independence, but say it must not be spoken in audible tones. But why not? Apparently because if we openly say "independence," it will make the Filipinos, whom we wish to see independent, desire to be independent! We cannot understand this. If our goal is independence, why not say so, and boldly walk towards it? It is said that we must first stamp out the insurrection and establish a stable native government. But how if a solemn official promise were the surest way to cause all arms to be grounded and the experiment of self-government most speedily undertaken? There we have the new policy which may be hopefully tried in place of the decrepit and discredited old one. In the one phrase, ultimate independence and ultimate withdrawal, we have the true sword wherewith to cut the Philippine knot. Where one man thought so and said so a year ago, a hundred are saying so to-day. It is only a question of time when the President of the United States will join the President of Cornell University in announcing his conversion to this view, and all the people will say, "Amen!"

THE PHILIPPINE INQUIRY.

Gov. Taft's testimony before the Senate Committee on the Philippines is alone enough to justify Senator Hoar's persistence in demanding a special inquiry into the conduct of the war in the Philippines. He is only the civilian Governor, obviously not in direct touch with the military situation in all parts of the archipelago, yet he has to admit that some of the ugliest stories about barbarities practised by American troops are true. There have been, he stated, cases of "unnecessary killing" (polite official phrase for murder), some cases of whipping and of the use of the "water cure" (that is, torture). Of course, he added, such things had been done against orders. They always are. The Spanish generals never put these things into orders—that was neither necessary nor convenient. And if the horrified army officers who have privately told Senator Hoar and others of the cruelties and atrocities committed in the Philippines in the American name—if they could go before the Senate Committee and state what they know, we do not doubt that we should get tales more grewsome in their particulars than anything known to Gov. Taft.

By his evidence alone, however, is now established what has been indignantly branded as a baseless calumny. An interesting correspondence between Senator Lodge and a Boston clergyman, the Rev. Charles F. Dole, was made public the other day. His clerical constituent wanted to know why the Massachusetts Senator opposed an inquiry into the Philippine matter, if for no other purpose than to set at rest the minds of those who feared that "cruel things are being done in those islands under the shadow of our flag." In reply, Mr. Lodge protested that he was not antagonizing an investigation, but declared that he was "slow to be-

lieve the rumors and tales" which, he said, he was "told" were circulated about men wearing the uniform of the United States. "I certainly shall not believe such charges without proof," he said. Well, we suppose he must consider the admissions of the highest civil officer in the Philippines to be proof. This being so, can he wonder that the Rev. Mr. Dole should say that "the conscience of our people is uneasy" about matters in the Philippines?

What will not let our conscience sleep is not merely the fact that we are at war, nor that the war is a lustreless and ignoble one; but that we are caught doing the very things which led us to go to war in solemn protest and in the name of an outraged humanity. When it was the Spaniards who were guilty of "unnecessary killing" (in Gov. Taft's elegant words) and of torture and of reconcentration, in Cuba and in the Philippines, we did not fall back on the cold philosophic comfort that "war is inherently a cruel thing"; that it is necessary to be "severe," and that, the more truculently we make war, the sooner will the enemy ask for peace. No, those salves we prudently reserved for our own conscience. The Spaniards we denounced to high heaven as monsters without excuse. Our war against them was to be a "holy" war; and it was as champions of religion and the tenderest humanity that we unfurled our banners, only to find that we were soon to allow, or at least to apologize for, in ourselves the things we had fiercely condemned in others. This is the moral tragedy of our Philippine war.

For the rest, Gov. Taft's testimony is a fine example of that official optimism on the husks of which we have been fed for three long years. When asked how his statements about the temper of the Filipino people could be reconciled with Gen. Chaffee's and Gen. Bell's, he could only shrug his shoulders and say that he looked at matters "from a different point of view." But which point of view is more apt to be correct—that of a civil governor, immersed in business and drawing his information mainly from natives in his pay, or that of a military governor, getting almost daily reports from his subordinates in all parts of the archipelago? However that may be, Gov. Taft's urging of a policy of the utmost "severity" against the Filipinos still in arms is likely to have a very bad effect, both in the Philippines and at home. It will be strange indeed if it does not lead in the islands to more of those cruelties which the hot-blooded soldier, not under the eye of an officer, will think are just the thing to employ against people who, Gov. Taft says, have "worn out their right" to lenient treatment and are committing a "crime against civilization." This, by the way, is a strange definition of crime to come from an American judge. A struggle for independence against enormous and apparently hopeless odds has been differently described by earlier American authorities. But we have changed all that, as we have also, in going over with Gov. Taft to the notion that a passion for liberty can be strangled by "severity," forgotten our other historic maxims. It is a problem of statesmanship, not of bloody war, which confronts us in the Philippines, and to the statesman, as John Bright said, "force is no remedy."

WHAT IS OUR "COMMERCIAL STRATEGY"?

The rambling report of the Senate Committee on Foreign Relations, urging the ratification of the treaty for the purchase of the Danish West Indies, speaks of the islands as "of great importance in a strategic way, whether the strategy be military or commercial." As for the military strategy involved in the proposed acquisition, everybody knows that it is the creation of our high naval theorists at Washington, who spend their time over a kind of transcendental *Kriegsspiel*, planning all sorts of likely and unlikely, possible and impossible attacks and defences. They are the chief advocates of the addition of St. Thomas to the other undigested lumps of empire now lying heavy on the national stomach, and but for them the appetite of the Senate, grown a little queasy as respects islands, would not be eager to swallow the Danish morsels. All this metaphysical strategy of the navy we must, of course, leave to the adepts in that recondite art; but what is meant by the "commercial strategy" of the Senate report? What do our Jominis of commerce refer to when they speak of our having a commercial plan of campaign at all?

If we have such a thing, it must be illustrated in our present attitude towards trade. No change is intended. We are to display our "strategy" in the Danish Islands just as we have done in the Philippines, just as we are doing in Cuba. That is, if St. Thomas and St. Croix have anything to sell, we shall do our best to prevent them from disposing of it, and shall set ourselves skilfully to the task of so impoverishing their inhabitants that they will be unable to buy anything of us. That, according to Gov. Taft, is the net result of our commercial tactics in the Philippines; that, as Col. Bliss testified, and as every wind that blows from Cuba tells us, is the able strategy which we have employed in that island. Thus we begin to see what the nature and aim of our commercial strategy really are. As those battles are considered the most subtly planned which result in the greatest possible victory with the least possible loss of life, so we plume ourselves on the exceeding slyness of our commercial methods, which enable us to keep imports and exports at the lowest possible figure. In other words, our commercial strategy consists, so far as our present laws and policies are able to determine it, in discouraging commerce.

Turning from the islands which we control to the great markets of Europe, we perceive that our strategy is directed to the closing of the doors which are now partly open to us there. Strategy in commerce must be like that of war in at least this respect, that it aims to divine the intentions of the enemy and to frustrate them. But ours we brag about most when it plays right into the enemy's hand. Our greatest existing commercial enemies in Europe are the Agrarians of Germany and the high protectionists of Austria and France. What they are hoping we will do is to reject all reciprocal trade arrangements, and keep our tariff rates on their goods at prohibitory figures. That will aid them in their plans for retaliation and for a complete shutting out of our exports. Mr. Vanderlip's article in *Scribner's* forcibly points out this peril, particularly in the case of Austria. Yet our profound trade policy, of which the Senate report speaks, is nicely calculated to do precisely what our opponents desire—to provoke hostile legislation and reduce our sales. This may be strategy, but it looks uncommonly like folly. We are falling into the same old stupid blunders which ruined the Dutch-English trade at the time when Canning wrote his celebrated poetical dispatch:

> "In matters of commerce the fault of the Dutch
> Is giving too little and asking too much;
> With equal advantage the French are content,
> So we'll clap on Dutch bottoms at twenty-per cent.
> Twenty per cent.
> Twenty per cent.
> *Nous frapperons* Falk with twenty per cent."

Our strategic cleverness in international commerce is strikingly illustrated by current events. Demand has outrun production in some lines of steel manufacture. Several of our railways are in urgent need of steel rails, but cannot get them made at home, and are seriously thinking of placing orders abroad. But our strategy has placed in the way a tariff of seven-twentieths of one cent a pound. That shows how smart we are. Yet at the same time, as the latest instalment of the report of the Industrial Commission shows again, "some of our exporters [notably steel-rail manufacturers, *teste* Mr. Schwab] make lower prices abroad than at home." This seems to us a new proof of our astuteness in trade, yet the Commission speaks of it as an abuse which Congress should investigate and correct. It also recommends that "tariff modifications" be made, along with "reciprocal legislation or arrangements," to take advantage of our "commercial opportunities." But commercial strategy, we should think the Commission would know by this time, looks to making the least possible of our commercial oppor-

tunities. It cannot nullify them altogether. In spite of our laws, some trade will leap over the barriers we erect. But so far as we have any strategy written in statutes, so far as we have any commercial policy dictated to and accepted by a protection-frightened Congress, they are a strategy and a policy against international trade.

It is time that the tariff Rip Van Winkles at Washington waked up. With every skilled observer like Mr. Vanderlip warning us of the imminent danger of persistence in a policy of trade exclusion, with Western Republicans growing more and more outspoken in their demands for tariff revision, the sleepwalkers in the Capitol go on towards the precipice over which they and their party and the country are in peril of falling, unless they open their eyes and retrace their steps. "Strategy" may be against their doing anything, but common sense and the obvious needs of our commerce cry out for laws and treaties to make trade instead of killing it.

IRREPRESSIBLE IRELAND.

"An Irish stew," said disgusted Admiral Field, in the great Home Rule debate of 1893, "was the first thing they offered me when I landed in San Francisco. As if I had not enough of that at home!" But the signs are thickening that the English palate must resign itself to another taste of the delectable compound. The everlasting Irish question has lately been pushing itself to the front again in British politics, and bids fair to resume something like its old place in Parliamentary debates. Lord Salisbury, in his casual manner, dropped a remark the other day about Ireland being more unanimously and bitterly hostile to English rule than ever. This was a really pathetic confession, coming from an aged statesman who had devoted so many years of his life to successive "settlements" of the Irish difficulty. Yet it was as if his prophetic spirit were brooding on things to come, for in a couple of days there followed the election in East Down, where a traditionally safe and even uncontested seat was wrested from the Government, as the first fruits of the new "land-purchase" plan of campaign.

This, as everybody knows, is the movement to which the principal impetus has been given by T. W. Russell, M. P. for South Tyrone. The surprising thing about his attitude is, as our readers know, that he was formerly a stanch Unionist, even at one time a member of the Conservative Government, and a determined opponent of the Irish Nationalists. But he became convinced that Ireland had substantial grievances. He saw that behind the political question stood the land question. Even with the abolition of the grosser forms of rack-renting, even with the new system of judicial rents, even under the Irish Local Government Act wrung from the reluctant Conservatives, Mr. Russell found that the lot of the Irish farmer was intolerable. Indeed, the Government itself almost admits as much. It is now proposing a bill to enable tenants to buy out landlords. But Mr. Russell contends that this remedy is only skin-deep; that it will prove but one more of the half-way and now discredited acts for land purchase in Ireland; and he strikes boldly for a comprehensive measure which will everywhere in Ireland replace landlordism by "occupying ownership." Details of the scheme are set forth in his book, 'Ireland and the Empire.' The thing to note with present interest is the fact that he has won his first electoral battle with the Government, even on ground most favorable to the latter, and is defiantly challenging it to a fight all along the line.

The persistent vitality of the Irish agitation was well shown in the two nights of the debate on the Address from the Throne, when the spokesmen of Ireland held the floor. It was not simply that their speeches were witty, and lit up what had been a dull scene by flashes of invective and gleams of sarcasm. It was not alone that Messrs. Redmond and Healy were more than a match, both in eloquence and logic and law, for the Attorney-General for Ireland, who intervened, with lofty official condescension, in the debate. The great fact was that these Irish orators spoke, and knew that they spoke, for a united people, a people filled with a sense of burning wrongs and animated by a determination to protest and agitate and organize until redress was won. This was really the only vivifying part of the debate. On the South African question there was no sharp division of parties, no cleavage piercing below the surface. But Irish griefs and Irish demands were pressed home upon the attention of the Commons with a force and earnestness which may be temporarily rebuffed, but cannot be permanently quenched.

It should not be supposed that no measure of justice for Ireland can be passed until the Tory Government is turned out. Lord Salisbury has, as a matter of fact, accepted legislation for Ireland more radical, in some respects, than anything Mr. Gladstone advocated. Reference has already been made to the Irish Local Government Act—a Tory law, put upon the statute-books by the very Prime Minister who, in 1885, had declared that local government would never be applied to Ireland. It was the same Salisbury who, in 1887, called Heaven to witness that neither he nor his Government would ever interfere with judicial rents, but who afterwards found that what he called "existing circumstances" compelled him to do so, despite the outcries of Irish landlords. Mr. Morley, indeed, brought out of his scrap-book an awful extract from a speech of Lord Salisbury's in 1885—nothing less than an apology for Irish boycotting; the Conservative leader being, in that year, not at all sure that he should not have to rely upon Irish votes to become Prime Minister. "Let us, after all," said he in his beautifully detached and dispassionate way, "look at boycotting. It is more like the excommunication of the Middle Ages than anything we know now. The truth about boycotting is that it depends upon the passions of the population." It is this extreme adaptability, to speak of it handsomely, of English Conservatism which lends some plausibility to the belief of Sir Charles Russell that Irish Home Rule would yet be granted by the Tory party.

"On my word," Barry O'Brien reports him as saying, "I often think that we shall get Home Rule from the Tories. Remember that the Tories gave us Catholic Emancipation. Never mind [at a gesture from me] how or why they gave it to us. They did give it. They have now given us Irish Local Government, which is the complement of Catholic Emancipation; why should they not give us Home Rule, which would only be the complement of Local Government?"

Ireland's hope is in peaceful agitation. Fenianism and the Clan-na-Gael are her enemies, and are, we believe, more and more felt to be so by the Irish leaders, in spite of the wild and whirling words which they sometimes use, by way of keeping up their spirits. And there can be little doubt that Parliament will, in the end, listen to the measured and reiterated representations of the Irish people. But they must work in the spirit of the Irish poet Ingram, quoted by Mr. Russell:

"Each nation master at its own fireside—
The claim is just, and so one day 'twill be;
But a wise race the time of fruit will bide,
Nor pluck the unripened apple from the tree."

THE INVESTIGATOR AS TEACHER.

President Eliot, in his annual report, raises the question whether the position of a professor doing full work in a university is favorable or unfavorable to original research. He recalls that recent founders of professorships have specified that the holders should be allowed "leisure enough to contribute to the advancement of learning in their several departments." Behind such a provision there clearly lies the conviction that college professors generally do not have "leisure enough" for productive scholarship. That the present conditions of academic service in America are not favorable to investigation is, in fact, the chief, if not the sole, reason for great endowments for research like the Carnegie Institute. Of such endowments President Eliot sagaciously observes that "the world has little experience of wise schemes for this purpose," and he appears to believe that college and university professors, with all their

disadvantages, are still quite as likely to be productive in research as the investigators who are free from academic trammels.

Certain drawbacks of the professorial life are, indeed, mainly imaginary. The majority of young investigators who carry their doctoral laurels to a minor instructorship consider their teaching simply a necessary evil. Classes and the innumerable details of college work seem so many obstacles to research. But it is inevitable, and most desirable, that these young men should drop from the sublimated atmosphere of the graduate school to the solid ground of ordinary serviceableness. That jolt does no harm, and often does much good. Even as specialists, most students gain distinctly by serving as teachers. It is a clarifying work. To present the main features of a subject to a class of young men or women is in some way to fix not only the methods of a specialty, but its wider relations to other specialties and to culture. This is a discipline without which the specialist remains more or less of a cave-dweller. Anything that brings him into ordinary useful human relations, short of undue encroachment upon his time, is distinctly to his benefit.

But it remains true that most of our college professors are needlessly hampered in their capacity as investigators by the quantity and conditions of their class work and by the miscellaneous administrative duties which fall to their lot. A university professor in America teaches more hours a week than his French or German colleague, and his work is of a more exacting sort. Where a Continental scholar gives from six to eight lectures a week, the American gives from ten to sixteen. In the one case the greater number of hours is filled by lectures delivered in rotation; in the other a considerable amount of drudgery is involved, such as the assigning and correction of exercises, the conducting of frequent examinations and informal tests, the keeping of elaborate records of scholarship, and even of attendance. From these things the professor at a European university is relatively free. That is, the American not only works more, but works harder than the French and German professor. The very measures taken to remedy this state of things bring almost as much work as they abolish. Promotion to be head of a department means, to be sure, a reduction of hours of teaching; but it also means the correlation of a score of courses, the appointment and supervision of associates and assistants, a new set of committees to direct and of records to keep.

Beyond the range of a professor's immediate duties, there are equally pressing claims upon those precious moments which should be consecrated to settling "*hoti's* business" and the "doctrine of the enclitic *de*." If he displays administrative capacity, the university will welcome him to a dozen working committees. Learned societies will make a bookkeeper of him, and teachers' conventions will require addresses. All of these demands, be it observed, are strictly professional, and may not be disregarded lightly. It would be easy to name more than one great investigator whose time, between departmental and general administrative duties, is fairly torn to tatters, and whose production in research is seriously diminished, both in quantity and in character.

The remedy is, obviously, to reduce the hours of instruction of the productive scholar, and to relieve him, so far as possible, of all part in general university administration. But this is easier to say than to do. First of all, it is not wholly easy to recognize the investigator who is worthy of this special exemption. The greater part even of university professors are not notable investigators, but find their largest usefulness precisely in their teaching and in their administrative activities. Next, it is frequently difficult on financial grounds to lessen the number of courses assigned to a professor; for some one else must be paid to do this work, and university budgets are notoriously in straitened circumstances. It should be, however, the duty and the pride of presidents and trustees to make just this discrimination, and to see that the great scholars, whose fame will be the prestige of the university, are not forced unduly into the mere work of administration. The governing bodies of universities, unluckily, have not much more soul than the average corporation. It is very likely that one of the most valuable functions of the Carnegie Institution will be not only to provide leisure for many an overtaxed investigator, but incidentally to stimulate both presidents and trustees to a keener appreciation of the high value of productive scholarship. Investigators generally should teach. Here we agree perfectly with President Eliot. But they should not teach as much as those who bring nothing to the university but approved civic and pedagogic capacity.

CUBA AND JAMAICA.

December, 1901.

It is only ninety miles from Cuba to Jamaica, and the smaller island resembles the larger in so many natural features that the visitor expects to find their population and their social character (allowing for the differences between English and Spanish rule) generally similar. The eastern end of Cuba is mountainous, and the mountains of Jamaica, which may be seen from Cuba in exceptionally clear weather, are of nearly the same height and covered by equally rich and beautiful forests. The climates are much the same, though that of Jamaica may be a trifle hotter. The staple products are the same. Both have relied upon the sugar-cane, and in a less degree upon tobacco and coffee, though the Cuban cigars have secured a higher place in the world's favor than those of Jamaica. Both produce excellent oranges and bananas. Both are naturally healthy countries, and may expect, now that science has shown itself certainly able to reduce, and probably able to extirpate, yellow fever, to become favorite health resorts in winter, to which visitors will flow in increasing numbers from North America and perhaps even from Europe.

Nevertheless, there are differences enough to make each seem new and strange after the other, and to give an interest to an examination of the causes of the differences. To begin with, Jamaica is by far the more densely peopled. Cuba, with an area of 36,000 square miles, has only 1,575,000 people. Jamaica, with 4,000 square miles, has nearly 700,000—that is to say, it is only about one-ninth of Cuba in size, with not much less than one-half of the population of the larger isle. Of these 700,000 only 15,000 are whites, whereas in Cuba nearly two-thirds are reckoned as whites, and little more than one-third as colored. It is true that in Cuba those who are not black are apt to be classed as whites, so that probably there is a good deal more than one-third of negro blood in the population taken as a whole. Still, even allowing for this, the African element is incomparably larger in Jamaica; and whereas thousands of Europeans are coming every year to settle in Cuba, scarcely any come to Jamaica, whose population is evidently destined to remain quite as largely a predominantly colored population as it is at this moment. Being so much more densely peopled, Jamaica is also far more fully cultivated. In the forest tracts of Cuba one finds only a stray clearing here and there, with a negro family or two dwelling in seclusion among its bananas, living on what the patch of land produces, and caring but little to carry vegetables or fruits or poultry to a town which may be many miles distant. Even in the fertile and open lowlands which cover so large a part of Cuba, great tracts lie untouched by the plough and unstocked with cattle. But in Jamaica it is only the rough and stony ground and the swamps (not very extensive) that remain unused. Among the steep ridges of the Blue Mountains, as high and as rugged as are the hills of Cuba, nearly all the available ground has been turned to account for bananas, or for coffee, or for the cultivation of vegetables by the negroes for their own use, so that there are tracks all over the slopes, and one seldom goes far without finding houses. This gives quite a different character to the landscape, and has much to do with that variety and richness which is one of the conspicuous charms of Jamaican scenery. There is perhaps less breadth of effect than in Cuba; and one feels everywhere, with the sea closing all the views from high ground, that one is in a small country. But there is great richness and finish of detail, the sense of human presence and human labor supplying an element which is frequently absent in the more ample landscapes of Cuba.

When one comes to the towns, the contrast is still more marked. Though Jamaica is less distinctively English than

Cuba is Spanish, its streets and houses witness to the presence of a very different people. Here the advantage is with Cuba. Small cities like Cienfuegos and Trinidad, Manzanillo and Santiago, are cities, neatly laid out in Spanish colonial fashion, each with several large churches, two or possibly three centuries old, each solidly built, either of stone or of bricks, covered with plaster painted in bright colors. There is always a central plaza, and probably it is planted with handsome trees and flowering shrubs, with walks, and it may be a fountain. Usually there is also an Alameda on the outskirts. The whole place has a certain air of dignity. It seems to feel itself a city, with a respectable past, even if it has no ancient buildings and if it entirely lacks the tall piles and picturesque irregularity of the towns in old Spain. There is scarce anything of this in Jamaica, for even in the ancient capital, which the Spaniards called Santiago de la Vega, and which now goes by the name of Spanish Town, not many traces remain of the once dominant race. The towns of Jamaica have much less of a city air. Kingston, which is far the largest, with a population of 46,000 (the others are little more than villages), is entirely built of brick and wood. The brick, often dilapidated, is of an ugly color, and the wooden houses have a tumble-down look. There is a general air of squalor in the meaner streets and in the poorer suburbs, while even in the business parts of the town and in the villas of the richer people little has been done for beauty. One does not see the pretty *patio* which is characteristic of the Spanish house—an internal court, with its tiny garden and, perhaps, its fountain. The English, being a severely practical people, have built their warehouses, and offices, and even their villas with a view solely to business and to comfort. They keep the streets in better order than the Cubans do, or did before the reforming energy of the United States began to work upon places like Havana and Matanzas and Santiago. They provide a better surface for the cab driver and the wheelman. But Kingston, though the style in which the houses are built, with a sort of brick veranda or piazza raised above the street, gives it a kind of picturesqueness, is rather a mean-looking town, far less attractive than such places as Santiago or Cienfuegos.

The one merit of the Jamaican town is the extreme beauty of the trees, many of them showing brilliant flowers, which line the roads that lead out of it; and this merit belongs rather to nature than to the English. Yet, it is fair to add, when one speaks of the neglected and semi-squalid air of the poorer parts of the Jamaican towns, that something is due to difference of population. These towns are, except the warehouses and stores and the few villas of the Europeans, in reality negro towns. The negro, even when tolerably well off, has no care for neatness, and lives anyhow. In Cuba the negroes are the country-folk. In Jamaica they are the townsfolk also. Whether they are, as some say, more lazy and less intelligent than their Cuban brethren may be doubted. They are somewhat better educated, for the English have taken more trouble to provide instruction for them, and the Protestant missionaries have been more active among them than the Catholic priests have been in Cuba. But they don't seem, taken all in all, to be superior to the colored people of Cuba, though they have enjoyed freedom much longer.

There is another point in which the two islands may be compared. Both are, or think themselves to be, commercially unfortunate; and in both the planters ascribe their ill-fortune to the action of other countries. Both have depended chiefly upon sugar cultivation. In Cuba and in Jamaica one hears nothing but complaints of the depressed state of cane-sugar and the impossibility of making a profit out of it. The Cubans lament the protective tariff of the United States. The Jamaicans bewail the hard-heartedness of England, which has hitherto refused to impose upon the bounty-aided beet-root sugar of Continental Europe that countervailing import duty which would—so the Jamaican planters declare—save them from ruin. In both islands foreign optimists suggest similar remedies, telling the sugar men that if they would only introduce newer machinery, they could hold their own easily against beet-root sugar, and advising the extension of orange planting, in which both islands ought to be able to compete successfully with Florida, which has frosts to fear, and with southern Europe, whose fruit is generally inferior to that of the West Indies.

Here, however, the resemblance ends. Cuba needs labor and hopes to get it in greater quantity and in far greater efficiency by the immigration of Spaniards, especially the industrious peasantry of northern Spain. Jamaica has labor enough, and must be content with the kind of labor which she has, for no Europeans will come in to work in a country already tolerably well filled by a colored population. Black she is, and black she must remain. She may no doubt improve the quality of her black workers, but that will be a slow process. Cuba, moreover, sets great hopes on the development of her internal communications by the construction of a trunk line of railway, with branches north and south, in the eastern part of the island. Jamaica has already, if not as many railways as she needs, yet more than she can afford, for the Government to which they belong makes no profit out of them, and does not think of extending them at present. Unfortunately, they have been built with too wide a gauge. Thus, Cuba can at least feed herself upon bright prospects, which have no place on the more limited horizon of Jamaica.

Neither has Jamaica any political questions before her comparable to those grave and exciting ones which Cuba is called to solve. She has had no serious internal troubles since 1865. The disturbances of that unhappy year, due to unfair treatment of the negroes by the planters, led to the withdrawal of the form of representative government which then existed. Under the present Constitution, the Assembly is rather an advisory than a truly legislative body, for the Governor can when he pleases appoint a sufficient number of nominated members to enable him to pass the measures which he, or which the Colonial Office in England, wishes to see carried. There is always some grumbling in the British Crown colonies when acts are passed by a majority of nominated members against the votes of a majority of the elected members of any legislative body, and at present the elected members of the Jamaica Legislature complain of their practical impotence. But everybody admits that a country in which some 25 per cent. of the population are of African race, and in which from 80 to 90 per cent. have neither knowledge of nor interest in political questions, is not fit for self-government under representative institutions. She must depend upon the wisdom of those who rule her despotically in a more or less paternal spirit, either direct from England or through officials sent from England. The great bulk of the people appear, so far as a visitor can judge, to be content with her present position. The negroes and the people of mixed color, who in Jamaica hold themselves rather aloof from the pure blacks, are quiet and peaceable, and, for the most part, indifferent to politics. The whites are occupied with their economic depression, and want to get more help from home for the development of their industries. The finances of the island are in a depressed state, and even the aid which the mother country has given does not enable things to be done which ought to be done.

A concluding word may be said on the attractions of the two islands to visitors. Jamaica is perhaps the more beautiful of the two, for it not only has a more luxuriant vegetation, with a profusion of flowering trees, but has shores more generally picturesque. Nothing can be imagined more charming than the line of the north coast, with romantic bays, backed by richly wooded mountains and bright, foaming streams, descending to the sea in waterfalls or from the recesses of the limestone rocks. The climate is, however, a little warmer and perhaps a little moister. As respects hotel accommodation, Jamaica has less than she ought to have or might easily have, if her people were more enterprising, yet far more than Cuba can at present offer. Outside the neighborhood of Havana, there is scarcely a hotel in Cuba to be recommended. Jamaica has, however, besides two good establishments, one in and the other quite near Kingston, a creditable hotel at Port Antonio, to which most of the steamers from the United States ply, and several places in the interior offering tolerable quarters. If these were further improved, Jamaica might become a most attractive winter resort, for the interior is in many places high, and with a climate which is, especially in the western half of the island, fresh and even bracing, while never chilly. For the beauty of skies and landscape, no praise can be too high.

OMPTEDA'S NOVELS.

BERLIN, January 22, 1902.

The list of books for the Christmas season of 1901 was enlarged by the addition of 'Cäcilie von Sarryn,' by Georg Freiherr von Ompteda. The appearance of a new novel by Ompteda has grown to be a literary event of some importance in Germany. According to the reports gathered from all parts of the country by *Das Litterarische Echo*, he was the novelist second in request in 1901, while he stood first in 1900. Of single books his 'Eysen' was the one most called for in 1900, and held the second place among all German novels in 1901. His newest book appeared presumably too late in the year to affect the final result. Two

of his principal novels are already approaching their tenth edition. In this land of many books and small sales, such figures show a comparatively large demand. The verdict of the lending-library and the book-shop is, of course, not necessarily conclusive as to literary values; but, in the case of Ompteda, popular favor has certainly not been won by sensational methods.

In the December number of *Das Litterarische Echo*, he writes briefly about the events of his life before the force of circumstances made him choose literature as his vocation. The family is of Friesian origin, and fled to Hanover to escape the persecutions of the Duke of Alva. In the new home, it rose to prominence, and played an honorable part in the history of the adopted land. Ompteda was born at Hanover on March 29, 1863. His father was the Lord Chamberlain of King George V., and voluntarily followed his master into exile after the events of 1866. The family settled in Dresden in 1872. Here young Ompteda entered upon a gymnasial course, but was afterwards transferred to a military school and became eventually an officer in the German army. He was an inattentive pupil, and his school days were by no means happy. In 1892 partial deafness, resulting from an accident, compelled his retirement from the army. Scribbling had long been the occupation of his leisure hours, and he had, indeed, issued a volume of verse, under an assumed name, as early as 1890. It was, therefore, natural that the changed circumstances of his life should transform the officer into the novelist.

Between his first book, 'Von der Lebensstrasse,' of the year 1890, and his last, 'Cäcilie von Sarryn,' of the year 1901, there is a longish list of others, almost entirely novels and short stories. It cannot be said with fairness that all are really worth reading. The list is rather long for the few years in which it has been in the making, and the author has perhaps had his difficulties in learning to use the tools of his new vocation. But he is at least never trivial. His statement that almost all that he has written was years in assuming shape in his mind before he went at the easier task of putting it on paper, may be the simple explanation of both his successes and his failures, for his weaker novels do not suffer so much from imperfections in plot and character-drawing as from bungling and inadequate expression. On the other hand, he has had his successes,which, though they may not rank among the great masterpieces, are enough to make him justly a prominent figure among German novelists of to-day.

Ompteda is at home in two places, the barracks and the city. He makes only brief excursions into village or country. What he knows best and treats best is, of course, the German officer, although not half of his heroes wear the uniform of the Kaiser. In his best military vein is 'Unser Regiment,' which appeared in 1895, and is a series of capital sketches of garrison life in a small city. The city might, indeed, as well be large as small, for it has next to nothing to do with these sketches, which depict the life of the young officer at work and at play, in the casino and on the drill-ground, on the march and by the bivouac fires during the autumn manœuvres. They are undoubtedly, in part chapters from the author's own life. Until the year 1889 he served as lieutenant with his regiment in the little Saxon city of Grossenhain.

In his 'Sylvester von Geyer' (1897) Ompteda tells the story of a representative of that large class of officers who turn to the army from a sort of instinct. For generations the men of their family have followed no other career. On innumerable battle-fields they have fought for their sovereign, and in times of peace have drilled his troops, until the habit of being an officer has passed over into the very blood of their descendants. The Geyers are such a family. The father, to be sure, was not very successful in his profession, and resigned before the birth of Sylvester, to live, as best he might, on his scanty income in Dresden. The boy was not to enter the army, but the instinct in him was too strong for all parental plans. He exchanged the gymnasium for the military school, and afterwards served as lieutenant with his regiment in Meissen. In spite of periods of discontent and of inner protest against the sometimes irksome duties in the barracks and on the drill-ground, he felt himself in his proper element, and grew steadily in all the virtues of the officer until the author saw fit to cut him off at the early age of twenty-four. Ompteda, too, passed from the gymnasium to the military school in Dresden, and knew Meissen, where the family owned a vineyard, from his childhood. Perhaps 'Sylvester von Geyer' contains more than one page of autobiography. Be that as it may, it is certainly a charming boy's book for grown-up people. It and 'Unser Regiment' are the most interesting of all of Ompteda's works for the foreigner, if not for the German.

His 'Eysen' (1900) and 'Cäcilie von Sarryn' may also be counted among his best, the latter being perhaps more satisfactory than the former in both plot and execution. 'Eysen' may be briefly described as a problem novel of to-day, seeking to answer the question, How shall the German nobility adjust itself to the conditions brought about by the upgrowth of the aristocracy of wealth? The different persons in the book who bear the name Eysen face the problem each in his own way. Some make a failure and others a success of life, but the problem remains unsolved after all.

These two novels and 'Sylvester von Geyer' are loosely united in a series under the general title of "Deutscher Adel um 1900." This title has its obvious fitness for 'Eysen,' and does well enough for 'Sylvester von Geyer,' but can have only the most superficial connection with 'Cäcilie von Sarryn.' Nothing in the novel has to do with the privileges or prejudices of the nobility as such. It is a story of pathetic self-sacrifice, which could as easily have found its heroine in any burgher family which has too much money to starve and not enough to live on. Cäcilie is the Cinderella of the family, gifted only with a strong sense of duty and an immense capacity for loving. She scarcely dares to dream of wedded happiness for herself. When it at last approaches her in the guise of a middle-aged widower, and she is for once in her life almost ready to be selfish enough to desire something for herself, a railway accident results in the death of a sister, and leaves her in charge of a family of small children. Her pathetic struggles and her triumphant success in making useful men and women of the family thus thrust upon her, are told simply and well, although with so much of detail as to become tiresome at times.

Ompteda is a keen observer of every-day life. This fact explains both his limitations and his strength. The unusual seems not to exist for him; but what he sees on the streets and in the houses of Dresden or Berlin, he describes as few others can. The reader's pulse beats no faster as he occupies himself with one of his novels. They tell of no deeds of daring nor of tender hearts broken beyond the mending. German matrons will not lose sleep over them, as Barrie's mother did when she declined to go to bed till she saw how Stevenson got the laddie out of the barrel. On the other hand, it must not be forgotten that Germany is passing through a tremendous transformation. Commerce and manufacture are coming to the front, agriculture grows yearly less important relatively. Already it is true that the army and the city *are* modern Germany, and Ompteda is at home in both.

CHARLES HARRIS.

CHURCH LEGISLATION IN ENGLAND DURING THE XIXTH CENTURY.

OXFORD, January, 1902.

In 1832 "the Church of England as by law established" appeared to be destined to all but certain destruction. It was a time of reform nearly turning into revolution, when a man as cool-headed as Macaulay believed that the House of Lords would not last for ten years longer; and of all English institutions the Church Establishment stood to all appearance on the most shaky foundations. It was undermined by two patent defects. The obvious abuses of the Church were at least as bad as the obvious abuses of the State; the Church, again, which was termed national, had for more than a century ceased to be the church of anything like the whole nation. Even an optimist who was not terrified by the revolutionary aspect of the day might, with some assurance, have predicted that the Episcopal Church would, long before the century was over, either cease to be the church of the nation, or else be so remodelled as to comprehend within its limits the whole body of English Protestants. There seemed to be no alternative to either Disestablishment or Comprehension. This reasonable forecast has been falsified by the event. The English people have, during the nineteenth century, rejected the policy alike of Disestablishment and of Comprehension. The connection between State and Church has been preserved by the singular and unforeseen system of Concession combined with Conservatism. My aim is to explain, as far as is possible within the limits of a single letter, the nature and the causes of a course of proceeding which is recorded in a series of Acts of Parliament.

The first note of English ecclesiastical legislation has been Concession. Within the twenty years that followed the Reform Act, satisfaction was given to the demand for the removal of abuses which scandalized Churchmen no less than Dissenters. The Ecclesiastical Commissioners Act, 1836, the Church Discipline Acts, and other enactments soon made pluralism and the non-residence of the clergy matters of the past. Proper management of ecclesiastical

property at once increased the resources of the Church, equalized the revenues of the bishops, and all but removed, among other abuses, the scandals connected with translation from an ill-paid to an overpaid bishopric. Practical reforms of this kind, owing to the respect paid by English law to vested interests, could not produce their whole effect at once. Still, they worked with rapidity. The Establishment of 1850 was the Establishment of to-day and not the Establishment of 1800. Abuses which, at the beginning of the nineteenth century, had not excited the attention even of religious men, had, by the middle of the century, become intolerable even to men of the world. When we remember that reform began practically only about 1836, the legal and moral effect produced by legislation of fourteen years may amaze the historian of law and opinion.

Concession, again, was made to the demand for the removal of any practical grievance whatever which was not absolutely involved in the maintenance of the Established Church. Dissenters and (to anticipate the phraseology of to-day) Agnostics detested the law which required that every marriage should be celebrated in accordance with the rites of the Church of England. The Marriage Act, 1836, permitted marriage in a Dissenting chapel in accordance with the forms used by a congregation of Dissenters, and created a form of civil marriage for the benefit of any one who deprecated the use of any religious ceremony. The Universities, which had been, in effect, institutions for the education of members of the Church of England and particularly of clergymen, were, step by step, opened to Dissenters, and at last (1878) made something like places of national education. The demand, to take another example, for divorce, which was theoretically denied to every one, but in practice was granted by Act of Parliament to the rich, was in 1857 satisfied by the creation of the Divorce Court.

These, of course, are merely examples of the general trend of legislation. Let a student go back beyond the date of the great Reform Act, and consider the effect of the repeal of the Test and Corporation Acts, 1828, and of the Catholic Relief Act, 1829. He will then see that, from the very commencement of the era of reform, Parliament has, for seventy years at least, in matters affecting the Church, made a continuous series of concessions to the demands of any class strong enough to force some practical grievance on the attention of the Legislature.

Concession, however, has been constantly combined with Conservatism, which has often assumed the form of illogical compromise of principle. Not a step has been taken in the direction of Comprehension. The national Church is not, in 1901, any more than it was in 1801, the church of the whole nation. Concessions to the demands of justice or of obvious expediency have been constantly, not to say systematically, compromised or marred by deference to the principles or the sentiments of Churchmen or of the clergy. The line of Marriage Acts which were intended to remove the grievances of Nonconformists or Agnostics did not entirely achieve either object. They did not, till recently, place a marriage celebrated in a dissenting chapel in the same position as a marriage celebrated in a parish church; and when, two years before the close of the nineteenth century, this more or less sentimental grievance was removed, the result was achieved in a way opposed to public interest, namely, by allowing the absence of a Registrar from any marriage celebrated either in a church or in a chapel. And the law which instituted an optional form of civil marriage has not as yet made the civil ceremony, with which alone the State is concerned, compulsory. Parliament, again, has, as it would generally be asserted, abolished church rates; it has, in fact, simply abolished the compulsory payment of church rates, but has saved the dignity and consulted the interest of the clergy by allowing a church rate to be imposed while abolishing the power of exacting the payment thereof. Parliament, to give a last example, has, in the face of clerical opposition, legalized divorce, but, with a want of logical consistency which may lead to very bad practical results, has allowed a clergyman of the Church of England, and therefore an official of the national Church, to refuse to celebrate the marriage of parties either of whom has been divorced from a husband or wife still living—with the result that the clergyman is allowed to treat the morality of the State of which he is an official as opposed to the morality of the Church of which he is a minister.

This system of Compromise, combined with Conservatism, has achieved a singular success, of which every critic must estimate the worth or the worthlessness in accordance with his own religious convictions. The Anglican Establishment is in 1901 more popular and more influential than in 1801. Disestablishment has been avoided, not a single doctrinal concession has been made to Dissenters; the position of the Church has rather been shifted than essentially changed.

What have been the circumstances which have made possible this strange though more or less successful policy? The answer lies in the study of public opinion, and may be summed, though I fear scarcely explained, in a few sentences. At the era of reform the Church was not really unpopular. It still possessed great influence, as was amply proved by the political annals of the years immediately following the Reform Act of 1832. The reformers of the day, whether Whigs or Benthamites, were assuredly not ardent Churchmen. The Whigs looked very coolly on the clergy, who as a body were Tories, and regarded religious enthusiasm of any kind as a dangerous sentiment, closely allied with intolerance. The Benthamites, some of whom were really Agnostics and might have been called without gross unfairness Atheists, looked with no sympathy on any kind of religious Establishment. But neither Whigs nor Benthamites had, by the time when they began to direct Parliamentary legislation, elaborated any scheme of church reform. One celebrated disciple of Bentham's did, it is true, put forward proposals which he thought might give some utility to the Establishment: James Mill propounded a scheme which, considering his character, one cannot suppose to have been advanced as a joke, for converting the Church of England into an institution for the propagation of utilitarianism, and the practical cultivation of the virtues which, according to the philosophy of Bentham, were best calculated to promote the happiness of mankind. To a modern reader this plan of reform—drawn up, by the way, very nearly at the date (1834) from which Church historians date the rise of the High Church movement—proves only that a philosopher of great mental power and, from some points of view, of strong common sense may totally misunderstand the condition of the society which he proposes to reform. Neither Whigs, therefore, nor Radicals were in 1832, or, indeed, at any time, prepared to reform the Church. All they could really do was to pursue the course which they in fact took: they removed patent abuses and abolished any privilege of the Establishment that was felt to be a pressing grievance by the classes which stood outside the boundaries of the Church. This conduct, as far as it went, was wise, but it had the unexpected though perfectly natural effect of increasing the influence because it removed the unpopularity of the Established Church.

Meanwhile, at the very moment when reformers who had conceived no scheme of Comprehension, and dared not, even if they wished, carry out any plan of Disestablishment, were in fact restoring the moral prestige of the national Church, the High Church movement, which itself was due to causes far wider than the special circumstances of the English political world, began to reinvigorate the energy of the clergy, and to create slowly but certainly a condition of sentiment utterly foreign to the Individualistic Liberalism which governed English legislation in every field of law from 1832 to say 1865. Nor has the change of political sentiment which has marked the last quarter of the nineteenth century, been otherwise than favorable to the moral influence of the Church. Here, however, it may be well for me to hold my hand, for it is not to be expected that the columns of the *Nation* should be open to long disquisitions on the connection between the changes in English law and the changes in English public opinion. My aim will have been attained if I can impress upon your readers the peculiarity of the course of modern ecclesiastical legislation in England, and suggest the conclusion that it is due to the general current of English opinion during the nineteenth century, taken in combination with the cross-current of opinion or of feeling of which the High Church movement has been the visible sign.

Correspondence.

THE COMMON LAW FOR THE PHILIPPINES.

TO THE EDITOR OF THE NATION:

SIR: Apropos of Philippine legislation, I had always supposed that, in attempting to govern the islands, we should administer justice according to the forms which have obtained there ever since the people were introduced to European civilization. The civil law and the common law are systems so entirely different and distinct that I did not for a moment suppose that any of us, even the most enthusiastic, would seriously entertain the idea of compelling the Filipinos to conform to our methods of pro-

cedure. You may imagine my surprise and consternation, therefore, when I glanced over the pages of the Philippine Code of Procedure (Pub. Laws & Res. U. S. Phil. Com., 1901, No. 190), and find but little less than an attempt to foist a common-law practice upon a civil-law community—and this before we have fairly taken possession of their country, and before the people of those unfortunate islands have become familiar with our tongue; much less, therefore, with our jurisprudence. I wish you thought it worth your while to devote a few remarks to this phase of the Commission's legislation.

Very truly yours, LOUIS L. HAMMON.

MINNEAPOLIS, February 2, 1902.

AN ART-FOR-SCHOOLS ALLY.

TO THE EDITOR OF THE NATION:

SIR: Among the altruistic movements of the day there are two of much prominence which, growing up side by side, have done so irrespectively of each other, though they ought to be allied. These are the Municipal-Art—the effort to bring more beauty into cities and towns—and the Art-for-Schools. As yet the latter depends on private initiative and energy. Pictures are contributed by individuals and by organizations within and without the school—by teachers, classes, parents, by men and women acting through public spirit, by clubs which raise popular funds for the purpose, or, finding the object sufficiently in line with their own desires, contribute to it out of the club fund. To the latter group of donors the Municipal Art Societies and Village Improvement Associations should belong. For is not the purpose of the Art-for-Schools movement the education of the child in the knowledge of true beauty and the cultivation of his love for it? Is it not to train a generation which shall know and love beauty, to develop a public taste that shall make beauty law in home and street and city? What permanence for its results can city improvement expect or hope, if it have not such a public to appreciate and defend from spoliation its hard-earned victories? In so far, then, as the movement for civic æsthetics looks into the future, its cause and that of the effort to bring art into the schools are the same. Each would educate the child in culture—the one acting for the child's sake primarily, the other for the anticipated result upon the community.

The Improvement Society, in loyalty to itself, may even seek specifically its own ends while aiding the Art-for-Schools endeavor. Suppose, in the case of the high school, it confine its contributions to Municipal Art subjects, either scattering these pictures through the different rooms and halls of the school, or taking charge of a corridor and devoting it to a suggestive, logical, scientifically arranged, and locally pertinent exhibit. Pictures that properly belong to this subject—including, as they must, examples of monumental sculpture and architecture—are found in all the lists of "pictures appropriate for school decoration." The plan, therefore, would not mean the introduction of a new subject, but the more certain provision of the very pictures which are wanted, and then the increase of their efficiency and value by grouping, if desired, and inevitably by the child's perception of their local application merely through connecting their presence in the school with the donors' obvious ulterior object.

So long is the list of appropriate pictures, with plazas, *piazzas*, and bridges, with civic sculpture, with water-front and street scenes, with religious and Government buildings and mural paintings, that one is tempted to take up the fascinating task of going through the catalogues to prepare a special city-improvement list. It would deserve to find a ready demand if attention were given not merely to the titles but to their order of sequence. But at best such a list, if general, could be only suggestive. The collection, to attain the greatest value, would require local appropriateness. Suppose a river, bisecting the town, gives to it a conspicuous water-front which in the past has been neglected. Clearly, the Town Improvement Society in selecting a list of pictures for presentation—we will say to the high school, where a main corridor has been set apart for it—will do well to choose several views showing successful water-front treatment. These can vary from the elaborate Thames Embankment or the formal and costly quays and bridges of Paris to waterside parks, as the Lakefront at Chicago; to playgrounds, as Charlesbank, Boston; to drives, as the Speedway in New York or the Shore Drive in Chicago; or to the quiet walks at the edge of Amsterdam's placid canals. These pictures would not form the whole of the exhibit, but a conspicuous and suggestive portion of it; and if the subtle influence of pictures upon the mind of a child be as potent as is claimed, there would grow up a generation that would not be satisfied with the continued neglect of the town's river-front.

What is done to point out this opportunity might be done as well for the other local problems—for a dominating hill, for the intersection of important diagonal thoroughfares, for the grouping of public buildings, for the treatment of parks, squares, or playgrounds. And if the town itself have something good in the way of civic art, this should be emphasized and given a place among the other examples gathered from all the world, its comparison and classification made unmistakable. Thus, with the cultivation of municipal ideals, with education, there will grow up in the child an intelligent civic pride. If the town does not have something good in the way of civic art, its shameful lack should be as plainly pointed out.

There is one other thought in this connection. The Art-for-Schools movement is now dependent almost wholly upon voluntary contributions for support and extension. Some of its friends, indeed, look forward to a day when the decoration of the schoolrooms with photographs of artistic objects will be held to be as strictly the duty of the municipality as the tinting of the walls is now coming to be and as the provision of desks has been. May not that result, or at least its attainment in part, be hastened if the Municipal Art value of the movement be pointed out? For then city or town may frankly ask itself whether, maintaining its own the municipal standpoint, it may not properly include this among its other efforts for the advancement of the community—whether it be not, in fact, its duty to itself thus to teach its future citizens to love and wish for civic beauty, inspiring in their hearts a wish to make their own environment as beautiful or splendid as other cities are or have been, and to have done in its behalf what has been elsewhere done. An appropriation to be used for this phase of the Art-for-Schools movement would be an expenditure of public moneys for public art in a double sense. It would have popular approval far more quickly than would the municipality's purchase of photographs or casts of Grecian deities, its provision of animal pictures, of views of scenes in English history, of landscapes, and so on.

In the alliance of the two movements there appears to lie such certainty of benefit to each that the marvel is that they have been for so long indifferent to each other. CHARLES MULFORD ROBINSON.

ROCHESTER, N. Y., February 5, 1902.

Notes.

Prof. Willard Fiske of Florence, whose American address is in care of Cornell's Librarian, has raised a modest hue-and-cry after a missing manuscript on the game of chess from the pen of the Rev. Louis Rou. In the middle of the eighteenth century Mr. Rou was pastor of the French Protestant church in this city, and his controversial treatise was, in 1859, at least temporarily in possession of the late George Henry Moore, librarian of the New York Historical Society, who lent it to Mr. Fiske. It has now been lost to view. It is a thin small quarto of twenty-four pages, and may be lurking in some private library of a descendant of Mr. Rou. Portions of the treatise were printed in 'The Book of the First American Chess Congress' in 1859.

Dodd, Mead & Co. make the important announcement of their intention to reprint from the original manuscript, verbatim, the Journals of Lewis and Clark, to be edited by Reuben Gold Thwaites, who thus "rests" from his arduous labors upon the Jesuit Relations. The late Dr. Coues had the benefit of this long-hidden manuscript for his monumental commentary on Biddle's recension of the narrative, but not till the work was well under way. Probably he would have discarded Biddle altogether had he been informed in time.

During the present month D. Appleton & Co. will bring out a new edition of 'Personal Memoirs of Philip Henry Sheridan,' by his brother, Brig.-Gen. M. V. Sheridan, extended from 1871 to the elder Sheridan's death in 1888; a new edition of the fateful third volume of Maclay's 'History of the United States Navy,' modified in accordance with the findings of the Schley inquiry; 'The Pageant and the Ceremony of the Coronation,' by Charles Eyre Pascoe; 'The Earth's Beginning,' by Sir Robert Stawell Ball; 'Practical Forestry,' by Prof. John Gifford; and a 'History of Ancient Greek Literature,' by Harold N. Fowler.

Messrs. Putnam's speedily forthcoming publications embrace a "King Edward Edition" of Traill's 'Social England,' in six volumes, with 2,500 illustrations and numerous colored plates; 'The Administration of Dependencies,' by Alpheus H. Snow; 'The Famous Families of New York,' by Margherita Arlina Hamm; 'The Banquet Book,' a classified collection of quotations, by Cuyler Reynolds; 'The Story of the Vine,'

by Edward R. Emerson; and 'Field-Book of American Wild Flowers,' by F. Schuyler Mathews.

R. H. Russell's spring announcements include 'The True Napoleon: A Cyclopædia of Events in his Life,' by Charles Josselyn, and 'The Speckled Brook Trout,' by various experts, illustrated by Louis Rhead.

The Abbey Press has in preparation 'A Tour in Mexico,' by Mrs. James Edwin Morris, and 'A Soldier's Honor, with Reminiscences of Maj.-Gen. Earl Van Dorn,' by his comrades.

Frederick Warne & Co., who have removed to No. 36 East Twenty-second Street, will shortly issue a romantic story, 'Gripped,' by Silas K. Hocking.

Stephen Phillips's poem, "Ulysses," is to be published as a separate volume by Macmillan Co. It has just been put on the stage in London.

Messrs. Scribner announce 'Reconstruction and the Constitution,' by Prof. John W. Burgess.

The Pennsylvania Society of New York's Yearbook, now in press, summarizes "the more important historical and patriotic events of the year as they relate to Pennsylvania." It will be illustrated. The editor is the Society's Secretary, Mr. Barr Ferree.

We have received from Messrs. Lippincott further volumes in the Dent series styled the "Temple Bible," to which we have already favorably directed attention. Leviticus has been edited by J. A. Paterson, D.D., who points out that "the progress of Biblical criticism, especially in recent years, has really been due to the application of the Evolution theory to the problems of Israel's development. . . . It may safely be averred that Darwin's theory has contributed as much to the progress of intelligent study in the departments both of History and of Religion, as it has to the advancement of any branch of Natural Science." The editor of Exodus is A. R. S. Kennedy, D.D., who has a section on the literary problem of the Pentateuch. The gospels of St. Matthew and St. Mark have been cared for by the Dean of Ely. All these volumes are prefaced by mottoes for edification, and critical introductions, and conclude with "Biblical References in English Literature."

The defects in the natural history of the Scriptures (King James version) are touched upon incidentally in the interesting little volume on 'The Animals of the Bible,' by Gambier Bolton (London: George Newnes; New York: Scribners). Thus, the hyena is nowhere named, though it is generally agreed that Isaiah (xiii. 21) mentions this very common beast in Syria and Mesopotamia. "We must remember that many of the animals to which we shall refer were quite unknown to our English translators of the Bible in 1604." They were not, however, perhaps responsible for the coney's chewing its cud (Lev. xi., 6). The text is illustrated.

Lord Durham's Report on Canada in 1839 has long held its fame as a model of wise statesmanship, and its reprint now (Methuen & Co.) undoubtedly breathes the hope that its principles of leniency and conciliation may be applied in distracted South Africa as they were with such happy effect in Canada sixty years ago, when the High Commissioner found "two nations warring in the bosom of a single state." Indeed, no name has been oftener, in the Commons, thrown in the teeth of Chamberlain than Durham's, unless it be Burke's; and the Report is, in truth, a very arsenal of weapons against the Chamberlain policy.

In their 'Short History of England for School Use' (Macmillan) Miss Coman and Miss Kendall undertake a task beside which the preparation of a learned monograph is mere child's play. Every one will admit that it requires special talent to write a first sketch of any kind; but only those who have read one manual after another, each dryer than the last, until they think they know every modern work of this sort, can fully realize the difficulty of writing an English history for beginners. The usual fault is that the author is determined to pack too much information into his narrative. Miss Coman and Miss Kendall have succeeded better than most of their predecessors, but, if any shortcoming need be looked for, we would suggest that they have gone too far in the other direction. They are so strictly on their guard against overloading with detail that the element of fact, as opposed to dissertation, sometimes tends to appear rather light. The volume with which this may most fitly be compared is S. R. Gardiner's 'Outline of English History.' Miss Coman and Miss Kendall may claim an undoubted superiority in respect to their illustrations, their maps, and the mechanical features of their volume; but when it comes to the text, we cannot express the belief that they will drive Gardiner out of the field. As a practical textbook, however, their addition to the literature of this baffling subject is distinctly meritorious.

What are called "laboratory" methods of anthropology are illustrated in 'Experimental Sociology, Descriptive and Analytical,' by Frances A. Kellor (Macmillan). Delinquents in general are here dealt with, questioned, measured, and tested in the various ways known to physiologists and psychologists. Incidentally, some facts concerning the penal systems of the Southern States, which are of interest, are communicated. The scientific value of such investigations was clearly determined by Mill, in his 'Logic,' and this work illustrates his reasoning. It would, in any case, be difficult to believe that researches deserving the name scientific could be described in English so obscure, so slovenly, so ungrammatical, even, as is here sometimes employed.

There is a refreshing directness of speech, proceeding from clear ideas and well-digested plans, in the latest report of the Librarian of Congress. Much the larger part of the handsome volume (well worth its binding) is occupied with a select list of accessions and with a detailed account of the organization and present collections of the Library, with numerous departmental photographic views. Mr. Putnam has to tell, in his report proper, of his epoch-making scheme for the sale of printed cards to all the libraries of the country; of his regular exchange of cards with some of the more important, so that knowledge of the contents of the National Library may be readily accessible at many centres. He relaxes nothing of his request for a sufficient number of cataloguers, nor of sufficient compensation for expert service. The position of head of the Division of Manuscripts became vacant a year ago and more. "I have not filled it," says Mr. Putnam; "I cannot fill it properly until the salary shall be placed upon a reasonable basis. It should be $3,000"—against $1,500 assigned to it. The Library, he remarks, depends wholly upon its annual appropriation. No money gift has ever been made to it. It is outbid at auction sales by other libraries. The memory of Caleb Cushing and Edward Everett is revived in connection with the account of the Oriental collection and of the acquisition of a Columbus codex. Perhaps the most curious function of the library is the provision of a room for reading aloud and for musicales on behalf of the blind.

Simultaneously with the report are issued 'A List of Books, etc., on Samoa and Guam,' and the scheme of classification adopted for Class Z—bibliography and library science. The Library also distributes among its exchanges the Handbook of the Library building compiled by Herbert Small, and published by Curtis & Cameron, Boston, with copious illustrations.

Another fine library building is illustrated in the memorial volume, 'The State Historical Society of Wisconsin' (Madison), compiled by Reuben Gold Thwaites, and embodying the exercises at the dedication on October 19, 1900. The cost of this building was 20 cents per cubic foot, or 29 cents inclusive of equipment. The leading address, by Charles Francis Adams, is here reproduced at length. An appendix to it should not be overlooked, for it contains a full transcript of John Quincy Adams's several utterances in Congress maintaining the war power over slavery, with pertinent extracts from his diary. This and much other interesting matter is revealed in the index. A few years ago, who would have thought of indexing a work of this character?

There comes to us the first number of *Records of the Past*, published monthly at Washington by Records of the Past Exploration Society, and edited by the Rev. Henry Mason Baum and Frederick Bennett Wright. It declares itself "a strictly scientific publication." The initial contents relate to American antiquities, archæological interests in Asiatic Russia (contributed by Prof. G. Frederick Wright, fresh from the scene), and Pompeii. There are plentiful illustrations—those from Siberia most interesting.

The Quarterly Statement for January of the Palestine Exploration Fund contains an interesting description of the celebration of the Samaritan Passover on Mount Gerizim, by the Rev. Dr. J. E. H. Thomson. The partakers of the seven paschal lambs were 160 in number, all above the average height and with noble faces. There were apparently no Jews present, but a great crowd of Moslems, who were with difficulty prevented by the Turkish police "from bursting through the ring of celebrants and, by touching the lambs, desecrating the sacrifice." The high priest, in answer to a question in regard to a Samaritan Greek version made as an offset to the Septuagint, asserted "that when Ptolemy sent to Palestine for 70 translators, they in Jerusalem sent 65 and they in Samaria sent 5, . . . and that they had still the 5 versions made by their representatives." Among the other contents are articles on the Hospital of St. John by the late Dr. Schick, with an elaborate ground plan; on Golgotha by Gen. Sir C. W. Wilson; and

archæological notes by Prof. Clermont-Ganneau.

In the *Annales de Géographie* for January two large charts show graphically the results of observations of the Aurora Borealis at numerous stations in both hemispheres. We mention an article on the intimate relationship between geography and sociology, and a powerful appeal for the reforesting of the Pyrenees. A large number of facts and statistics, fortified by striking photographs showing the effects of erosion, lead up to the statement that "the Pyrenean water courses are more and more insufficient for the economic needs which they create; their average discharge is diminishing. There is only one remedy, that which the Russians, Americans, Spaniards, etc., employ to-day—to plant trees." There is further an illustrated description of the principal topographical forms of Burgundy, and an examination of the Elbe system, as a contribution to the special science known as potamology.

Longfellow is evidently held in high esteem by the French educational authorities. They have selected nine of his poems, including "The Village Blacksmith" and "A Psalm of Life," in which the candidates for the diploma essential for an appointment as professor of English in normal and high-class schools will be examined during the next three years. The other works chosen are selections from Aikin and Barbauld's 'Evenings at Home,' and Miss Corner's 'Every Child's History of England,' and Wordsworth's "Michael." The diploma for second-class schools requires examination in Mrs. Browning's 'Aurora Leigh,' Thackeray's 'Four Georges,' Macaulay's Essays on Milton and Warren Hastings, and Pinero's 'The Princess and the Butterfly.' This is the outcome of a movement for the exclusive teaching of foreign languages in French schools by Frenchmen or persons willing to be naturalized.

—The February *Atlantic* has two articles of special literary interest, "Reminiscences of Walt Whitman," by J. T. Trowbridge, and a study of the "Fame of Victor Hugo," by George McLean Harper. Mr. Trowbridge knew Whitman intimately from an early period of his career, and writes with a warm appreciation of his virtues, both as a man and as a poet, though with no disposition to make virtues out of mere eccentricities of character or deficiencies of training. In the first edition of 'Leaves of Grass,' he found much that seemed to him formless and needlessly offensive, and these faults were emphasized in the second and third editions. Yet he felt the spell of "the tremendous original powers of this new bard, and the freshness, as of nature itself, which breathed through the best of his songs or sayings." Mr. Trowbridge throws light particularly on Whitman's life in Washington during the civil war, and his relation to Emerson. Professor Harper's conclusion as to the fame of Victor Hugo is that the unfavorable attitude of the great critics, such as Nisard, Faguet, Lemaître, and Brunetière, is a safer indication for the future than Hugo's popularity with the masses. Even more than the public of his own day, posterity will appreciate his wonderful mastery of the French language, his energy and versatility, his exuberant imagination; but his intelligence will be regarded as of a secondary order. William Garrott Brown of Harvard contributes a good paper on "Lincoln's Rival," Stephen A. Douglas, or rather on Lincoln and Douglas together. The value of the paper lies in its recognition of the fact that the right side of the great struggle for negro enfranchisement can best be presented by a thoroughly fair treatment of those who, for one reason or another, ranged themselves partly or wholly on the side of the wrong. An editorial review of the Scudder biography of Lowell repeats what is perhaps the only serious blunder of the types in the two volumes, by which the poet is made to say, in the closing lines of "The Oracle of the Goldfishes":

> "And I am happy in my sight
> To love God's darkness as his light."

—The Caxton Club of Chicago has printed a handsome quarto volume by Mr. Cyril Davenport of the British Museum, upon the work of Thomas Berthelet, "Royal Printer and Bookbinder to Henry VIII., King of England." The name does not occur in the great Dictionary of National Biography, but this is not surprising in view of the fact that never, in Great Britain, has the artist in what are called "subsidiary" or "minor" arts been taken very seriously. Even in France the dictionaries of reference, previous to the as yet unfinished Grande Encyclopédie, are inadequate in their treatment of such followers of the byways of intellectual life. A very bad painter, a Fuseli or a Haydon, goes, but the best of decorative artists is assumed to be of little interest, he or his works, to the reading public. As to Berthelet, however, and to the book about him, the documentary evidence concerning him and his work is arranged in chapter ii. of thirty pages, and his book-bindings are criticised and the more remarkable of them closely described in chapter iii. of forty pages more. The pages previous to chapter ii. are devoted to an account of English bookbinding before the time of Henry VIII. All this is the work of an admitted expert, one who is also the author of three separate books on bookbinding in addition to other treatises on kindred subjects. It is, however, the illustrations which will most charm the student. Nothing better in the way of printing in color and gold has yet been offered. A trustworthy observer of such matters said to the writer not long ago that these were the finest reproductions in color of the flat covers of books that had yet been made—that is to say, those in which the illusion of reality was the most perfect; and only the recollection of the magnificent work done for the Burlington Fine Arts Club, and of a certain volume, a bookseller's venture, by Quaritch of Piccadilly, prevents our complete adherence to that view. As regards the two books especially named, the leathers in the Burlington Club book are represented as dim and soft in tone, as the morocco of two hundred years ago usually is, and as we love to see it, while those in the Caxton Club book are shown gleaming, as if newly oiled. We admit the possibility of a difference of opinion with regard to this. Perhaps the examples copied by the workmen (unnamed) who made the plates for the American book were in the possession of some amateur who loved to keep his treasures in high apparent condition, fresh and shining; and this again is a matter of taste. Besides the bindings, the Caxton Club book gives the facsimile of a title-page of 1532: 'Jo Gower de Confessione Amantis. Imprinted at London in Fletestrete by Thomas Berthelette, Printer to the kingis grace An MDXXXII, cum privilegio'; and opposite page 16 a reproduction of the *impresa* which the printer used—a more elaborate and more pictorial scheme than is generally used for such a device. There are, moreover, several other illustrations in the text, copies, printed in red on a tint, of heraldic bearings, mottoes, and the like, which are not given in the plates; and plate iv. has especial interest as showing the edges of a volume bound up for the first Defender of the Faith, since these edges bear a royal motto in gilded capitals.

—We thought we had said our last word on the 'Jesuit Relations' (Cleveland: Burrows Bros. Co.), when the publication of documents ceased, but the appearance of the general index brings us back to the subject once more. This last part of the work—so essential a feature of its usefulness—has been wonderfully well done. By glancing through vols. lxxii. and lxxiii., one can now see what a wide range of subjects the series embraces, and how fully it illustrates the history of New France. That proper names and subjects are both represented is a most inadequate statement. The index forms a complete analysis of contents. Take, for example, the word "bark (of trees)," and follow out the entries under it. "*As material:* for cabins [96 references]; canoes [57 references]; casks, boxes, etc.; cords; snares; cradles; household utensils; kettles; shields; sledges; tombs. *Other uses:* beds and bedding; litter for sick; (birch) in place of writing paper; dead shrouded in; eaten in time of famine; embroidery on; in Indian medicine; packages wrapped in; torches." We have given the number of references only in the case of bark cabins and bark canoes. Altogether, there are hundreds of references under the word "bark." "Mosquitoes" is treated with a like respect. "Beaver" receives greater prominence still, with heads, sub-headings, and hundreds of special references. These may be taken as minor examples. In the case of a large subject like "Indians" the classification becomes much more elaborate, and recalls the arrangement of a public library. Forty-seven pages of the index are given to Indians in general, apart from the numerous references to separate tribes. It is unnecessary to multiply details. This long set of the 'Jesuit Relations' closes with a complete and exhaustive index which is based upon logical methods and worked out with scrupulous care.

—'The Tale of the Great Mutiny' (Scribners) swells the number of those warlike and patriotic volumes which Dr. W. H. Fitchett seems bent upon producing. No one is a more convinced defender of his cause, or shows himself more anxious to defend the reputation of Englishmen for vigor and ruggedness. As J. K. Stephen, in merry mood, once observed of England:

> "The Saxon and the Celt
> She equitably rules;
> Her iron rod is felt
> By countless knaves and fools."

Dr. Fitchett, when he can discover his "masterful" Englishman (and it is no difficult matter), makes the most of him, especially if he is charging an armed Sepoy

half-drunk with bhang. "The level pistol, no doubt, had its own logic; but more effective than even the steady and tiny tube was the face that looked from behind it, with command and iron courage in every line. That masterful British will instantly asserted itself." We need not expect to find in this book a complete or dispassionate account of the Mutiny. Dr. Fitchett neglects to describe the general state of feeling in India when the rebellion broke out, and he closes promptly with the storming of Lucknow. His main theme is the promptness and daring which were so abundantly displayed when once the disturbance had arisen. We need not recall the Lawrences, Havelock, Edwardes, Nicholson, Outram, and the other heroes with whose names these pages chiefly abound. As a work of edification Dr. Fitchett's "tale" is well done. He does not make the tragedy of Cawnpore too lurid or the defence of the ridge at Delhi too superhuman. His praise of British valor is unceasing, but under the circumstances it cannot appear extravagant. By drawing largely from the memoirs of the period, which are abundant, he has added the proper touch of local color, while his love of incident does not seriously interfere with his delineation of the drama as a whole. In style this is a book which will be best appreciated by boys, but its graphic pictures of catastrophe and courage need not be for the young alone.

—'The French People,' by Mr. Arthur Hassall (Appletons), is a new volume in the "Great Peoples Series," edited by Prof. York Powell of Oxford. Although there is much of interest and value in the book, we feel that Mr. Hassall has neglected to make the most of a fine opportunity. In other words, he writes of the land and its annals, where he should be writing of the nation. No European state equals France in symmetry of development; nowhere else is the growth of the national organism so easily to be followed. Moreover, it is the design of this series to accentuate the idea of national evolution by dwelling upon the life of the people rather than upon politics alone. Of one shortcoming Mr. Hassall may be altogether acquitted: he has not made his sketch a bare political outline. But, when we consider the beauty of the process whereby the West Francia of Charles the Bald became the France of Louis le Gros, and the France of Louis le Gros became the France of Louis XI., we can only regret that Mr. Hassall has not succeeded better in describing the welding of the nation during the Middle Ages. We do not mean to imply that this motive is altogether disregarded. We would say no more than that Mr. Hassall falls short of the opportunity which the subject offers. Instead of following the operations of the strongest force, or even of describing the duel between feudalism and the crown, he devotes his attention to a number of things which, while important, are not of the first importance. A sense of relative complexity is thus created, where the greatest stress should have been placed upon the attainment of unity. In a treatise like the present, considerations of space should always be kept in sight by the reviewer, as well as by the author; but our criticism is the less weakened at this point because Mr. Hassall might well have spared something from his account of the period since the Revolution. The seventeenth and eighteenth centuries are also disposed of too shortly, in order that the era from 1789 onward may receive a greater share of attention. Prof. York Powell, in outlining the conception of his series, says: "It will try and show how populations such as dwelt in the lands we now call France and Spain gradually came to be peoples with peculiar and characteristic nationalities of their own, and how, all through the progress of their development, they influenced other peoples materially, morally, and mentally, whereby certain elements of our own present-day lives and circumstances may be accounted for." Judged by the standard of his editor, Mr. Hassall has succeeded less perfectly with France than Major Hume did with Spain. Finally, this volume seems to show signs of hasty preparation and of a too negligent revision. Slips like Beaumanois for Beaumanoir, and Courbetin for Coubertin, are not infrequent; while on page 51 occurs the following piece of enumeration: "Six states were set up—Italy, Germany, Provence, Transjurane, Burgundy, and France." Moreover, the writer's attitude toward modern France is too deeply affected by the views of Mr. Bodley. Mr. Hassall has long since proved himself to be a good historian, but we cannot express the belief that this is one of his most successful works.

GENERAL ALGER'S APOLOGIA.

The Spanish-American War. By R. A. Alger, Secretary of War March 5, 1897, to August 1, 1899. With maps. Harper & Bros. 1901.

That President McKinley anticipated no armed conflict when he took office is clear from his choice of a Secretary of War, and the outcome of that selection shows afresh the kindly watchfulness of Providence over the American people. An Apology would be the better title for this exculpatory volume, whose preface disclaims presenting a full history of the war, and whose obvious motive is to put on record a plea in avoidance in the hope of obtaining partial relief from popular censure. Its declared object is to note some of the conspicuous conditions affecting the active army, with an account of the administration of the War Department, in the naïvely expressed hope that it "will serve a useful purpose as an example" in another crisis. Had "example" been frankly written "warning," it would have been better, for, whether recognized or not, 'The Spanish-American War' is the history of administrative blundering relieved only by the skill and courage of subordinate officers and their commands. The ex-Secretary lays just blame upon Congress for habitual neglect of the army in peace, gives numerous illustrations of Gen. Miles's professional unfitness for his responsible position, complains that the naval forces did not coöperate properly with the army in the field, and places upon the President the discredit of such appointments as were objectionable. He extols the chiefs of the administrative bureaus as models of intelligence and energy, defends General Egan in everything but his intemperate vileness of speech, minimizes the sanitary defects of the great camps, gives a rosy sketch (with no intelligent detail) of the situation in the Philippines, and appears to regard Gen. Shafter as the highest expression of military efficiency. The convincing section is the one in which he allows General Miles to condemn himself out of his own mouth as a commanding general. One illustration of this out of many was his proposal to transfer to Cuba, regardless of the difficulties of marine transportation and debarkation and of subsistence, 15,000 newly raised cavalry, and the assumption that there soon would be from 30,000 to 50,000 prisoners, of whom "we could employ at reasonable compensation such as desired occupation in road building." There is no concealment of Gen. Alger's contempt for the commanding general as a military counsellor.

When the war opened, there was nowhere a military body superior to the rank and file of the army in selected physique, individual character, and essential discipline. But it was very weak in numbers, and the temporary enthusiasm of the volunteer legions behind it poorly replaced instruction and experience. In its lower grades the permanent establishment was well officered, and it was by these officers and the superb soldiery immediately under them that victory was compelled. The generals were few, and in great part had been selected upon the principle which governs kissing. In the long years of peace, all of these were mere supervisors of geographical departments, administrative functionaries engaged in keeping at the lowest limit the expenses of their commands, and in receiving and preparing routine reports, usually of trifling concern. The system was at fault. It did not foster military efficiency. Those who remained soldiers were such by the grace of God and not by aid of the War Department, whose deadly centralization suppressed all initiative. The administrative bureaus of science and supply were similarly crippled. They had power of a kind, but they maintained a hand-to-mouth existence with no reserve and with no thought for the morrow. Back of it all was Congressional parsimony, due to a popular opinion which asked for nothing else. Unwillingness to appropriate beyond visible needs, incredulity as to the possibility of any war, faith that an essential virtue belonged to the baptismal rite of mustering-in, so that a volunteer received soldierly efficiency with his uniform, not only discouraged but made impossible in peace that preparation for war which immemorial experience has counselled. There thus grew up about the War Department a sentiment that the smallness of an estimate showed efficiency, and to turn into the Treasury an unexpended balance was brilliant administration. Congressional illiberality compelled administrative pinching, and complicated rules of financial responsibility led to timorous hesitation. The official conditions discouraged initiative and originality. The troops were fed and clothed, quartered and paid, better than those of any other army. There excellences ceased. The individual was well cared for, but the organization was stunted. The exception was a long-standing nominal provision for a coast armament, whose realization, indeed, had languished, but was now helped by hasty purchase with the defence fund of foreign guns before proclamations of neutrality closed the doors of sale.

The ex-Secretary has no shame for his predecessors or himself as at all account-

able for the chaos into which the first pressure precipitated this general unpreparedness. He seems to make a merit of it that anything was accomplished, and takes credit that there was not utter collapse. He will not admit that with authority goes responsibility, and that it was his urgent duty to have his Department equipped. Congressional failure to supply funds was the immediate fault; but Congress necessarily depends upon estimates for adequate appropriations, and upon convincing explanations of their necessity and how they are to be expended without waste. There is no sign that any such thing was done. Even now Gen. Alger fails to appreciate the essential weakness of his administration, both structurally and through his selected agents. He has no conception of the confusion which existed, of the disaster which impended, nor that, in the absence of disobedient inferiors, he was responsible for both. In our system, the Secretary is not merely a civil administrator, and theoretically a statesman who aids the President; he assumes actual military functions, and, either directly or through the untrammelled pen of his adjutant-general, issues orders of initiative and interference, so as, when sufficiently weak through rashness and vanity, to act as a sedentary field-marshal. Under such conditions, where he does not disavow them, he must accept as his own the operations of those subordinates who are under his immediate direction. Nor can he shield himself from accountability on the plea that it is the President, and not himself, who imposes conditions; for, while he retains the portfolio of a Constitutional adviser, he must share with the President responsibility in his own department.

Six weeks before war was declared, Congress placed fifty millions for national defence at the absolute disposal of the President. Of this, the great supply department, the quartermaster's, received a one-hundredth part; the medical department, through whose hospitals and along the hands of whose officers nearly every man must pass in a war of any duration, whether defensive or offensive, one-twenty-fifth of the quartermaster's allowance; the subsistence department, nothing. Mr. Alger asserts that the President interpreted "national defence" literally, and, while he gave freely to the ordnance, the engineers, and the signal corps, he would permit the other departments to take no step outside the usual routine, nor allow them either to procure or to order material or equipment, so that, because of this prohibition, "absolutely nothing had been added to the ordinary supply as it existed March 9, 1898." The text contradicts itself, but apparently small allowances were assigned, as noted above. If this is so, if any allotment at all was made to these non-aggressive branches, it should have been in some reasonable proportion to their natural requirements. If the heads of those departments thought that $500,000 and $20,000 respectively were adequate, and prepared such estimates, they were incompetent. But if the President, of his own motion, ruled that the defence fund could be applied only to restrain assailing fleets and invading armies, and did not merely act upon the Secretary's suggestion to that effect, then the latter's acquiescence, in the absence of formal remonstrance, renders him also responsible. Both were victims of a logic whose falsity was perceived later; for, when war began, the same appropriation was freely employed for all military purposes. Could not a war minister realize that there is an offensive-defensive as well as a defensive-defensive, and act accordingly? On the other hand, if there was, as stated, no allotment at all before the declaration, and these insignificant sums were those assigned to support actual war, then incompetence becomes fatuity. Alone, this question of money is a trifle; it is only as an illustration of army control that it is important. The navy, under the same President, but with another Secretary, appears to have been unfettered as to ways and means.

When we reach the war itself, one reads with still less patience. There was no military head and no digested plan of campaign. Detached operations were discussed in numerous conferences between the President and the Secretary, at which other members of the Cabinet and Gen. Miles frequently assisted. The civilians could claim no professional knowledge, and we know what was thought of Gen. Miles, so that, wise or unwise, his views carried no weight. There was no one competent to direct, except as the Executive was the final source of power. And what happened exactly agreed with what might have been anticipated. Much of the army, followed by unequipped volunteers, was crowded over two single-track roads into Tampa because at Port Tampa, nine miles away beyond swamp and sand, reached by one line of rails, was deep water. No one who could act perceived that Atlanta, with its salubrious climate and abundant railroad facilities, was the natural base. A depot at Atlanta, with, if necessary, Huntsville, Charlotte, Augusta, Sumter, Waycross, and other less-known railway centres as auxiliaries, and Charleston, Savannah, Mobile, New Orleans, and possibly Port Tampa and Jacksonville, as sailing points, would appeal to any soldier. In the next war, unless the beaches and inlets from Wilmington south are to be garrisoned by fixed divisions, the defence of the southern coast must be made from Atlanta as the focus of a military parabola whose railroad rays touch every important littoral point.

What is true of defence is equally true of the preliminaries of offence. Nevertheless, every agent of aggression was pressed into Tampa during May. Gen. Alger now admits that "Tampa was not adapted to the concentration and the effective handling of the vast body of supplies necessary for an army of 25,000 men," and he implies that he knew at the time that Port Tampa was fit only for the dispatch of a small force. There seems no excuse for this miscalculation of capability, this demanding from a dwarf the service of a man. It resulted in waste of time and property, in unnecessary discomfort, and sometimes in hardship; and, worse, engendered distrust of a head which, having once directed streams of troops and supplies to an inappropriate site, had not sufficient decision to divert or stop them, and persisted in a recognized blunder. There was well-founded complaint that most of the volunteers were immediately concentrated in masses so enormous as to be hurtful to them as new troops, instead of being collected in preparatory camps of organization and instruction for later consolidation. Mr. Alger's reply is the assumption that a camp would be required for each of the forty-five States, which on its face is absurd; followed by the allegation that there were too few staff officers to administer such numerous centres. State camps would have been mischievous, and the policy of establishing mixed brigades, which the experience of the civil war demonstrated to be the true one, was eminently proper. But there is a vital difference between forty-five camps and ten or fifteen, and the great encampments repeated and magnified much of the confusion and inefficiency that prevailed at Tampa. The deficiency in staff officers was not real, for the Secretary had at his disposal a proficiency record of every officer's special qualification which would permit appropriate assignments without delay.

The offensive policy was fragmentary and vacillating. There was first ordered an expedition of infantry, of cavalry (it is presumed dismounted), and an excess of light artillery, to Tunas on the south coast of Cuba, and thence by sea to an undesignated point on the north coast. These were to be raids to supply the insurgents with arms and ammunition, and the orders curiously illustrate the crudeness of the directing mind as well as its estimate of the general to whom they were addressed. He was, in all simplicity, instructed to injure the Spanish forces as much as possible, but to avoid serious injury to his own command; healthful locations were to be found, and yellow-fever or other epidemics to be shunned; "and you are not expected to have your command on the island of Cuba but a few days." This expedition was abandoned before sailing, as was one to seize Mariel as a base of operations against Havana; and the Santiago transports, crowded to repletion, were held upon the Gulf a week in June—all through fear of the Spanish fleet, whose ubiquity and offensive power suddenly filled the official mind with dread, as though the naval force of Spain had sprung into life without warning or anticipation. Gen. Shafter's final orders were to proceed with a large expedition to the vicinity of Santiago, and move so as to destroy or capture the garrison, in order to cover the navy's small boats as they removed torpedoes, "or, with the aid of the navy, capture or destroy the Spanish fleet" in the harbor. The Spanish fleet was the objective; the land forces were incidental obstacles to be brushed aside. Again the instructions were those becoming a military kindergarten. Thus, the commanding general is cautioned against putting too much confidence in persons outside of his own forces; he is to take precautions against surprises, ambuscades, or positions that may have been mined or are commanded by the enemy; and he is to accomplish the object with the least possible delay. Having performed the moderate task of capturing the enemy's fleet "with the aid of the navy," he was to reëmbark for Puerto de Baños and await further orders there, unless he received other directions or should "deem it advisable to remain in the harbor of Santiago"—"this with the understanding that your command has not sustained serious loss," etc., etc. Can there be clearer evidence that Washington looked upon such warfare as a minor operation, and need we be surprised that it was staggered when climate and arms together brought disaster in July?

One of the most serious and widely known embarrassments of that campaign, the lamentable deficiency of medical supplies ashore, was the fruit of ignorance and neglect. Rather than carry more than seven ambulances for 17,000 men, Gen. Miles's portable shields, each requiring the space on a transport that an ambulance would occupy, were taken. A machine of that bulk (weighing, it is said, a thousand pounds) for use with infantry in a tropical jungle does not commend itself to the imagination, but Gen. Alger writes: "Gen. Shafter has frankly assumed the entire responsibility." So did Burnside for Fredericksburg. But, regardless of ambulances, the ex-Secretary admits that when the transports sailed, "even hospital equipment" was insufficient, adding in palliation, that at Tampa it was thought it "could be made good . . . in a very few days." Gen. Shafter's contribution is: "I had no idea we were going to have 1,500 wounded." Perhaps he thought there would be no sickness, for those to whom the epidemic of July was "unexpected" knew no history. Without recounting the evils that followed incapacity of various kinds—for the tangle at Siboney seems to have been worse than that at Tampa, and certainly more imperatively in need of being unravelled—no one will dispute the Secretary's own verdict, applied especially to the medical property, but which some may take as a generalization, that "no excuse can be given for the carelessness in shipping these supplies, or for not putting them ashore with the army." As we understand it, this does not reflect upon the medical department itself, which appears to be entirely dependent upon others for the transportation of its property.

In a way, ambulances and shields, medical stores, a regiment more or less, a June week of crowded transports motionless on the Gulf, even the unnecessary loss of some lives, and the happening of much superfluous sickness and other hardship, are of small account in examining a great campaign. But this was not a great campaign, and these flaws are typical of its character. The real question is: Was it good military policy to operate against Santiago under the existing conditions? Should land operations, with all the available regulars, have been initiated on the verge of a season of known fatality, under a physically infirm general whose qualifications were conjectural, simply to "assist the navy" in overcoming a blockaded fleet that had no hope of succor? We think no competent strategist would commend the proposition, at least until he was assured that there was practically no opposing land force. The hostile admiral, carrying munitions for the Spanish army, had found his natural objective, Havana, inaccessible, and Cienfuegos, with its railway facilities for distribution, unavailable. He had rendered himself incapable as a military purveyor, and impotent as a breaker of blockades, by entering the harbor of Santiago, 300 miles in a right line, and many more by the country roads, from rail communication. He was bottled, and his supplies not distributable, and his destruction was probable, should he seek the sea. The navy might surely be thought competent to prevent the exit or to effect the capture of its special foe. The province of Santiago, the most distant in Cuba, would fall of necessity with the destruction of the central power, and the possession of the town should have had no appreciable influence upon the war. As it proved, Spain recognized the approach of the irresistible when San Juan Hill was occupied and the fate of Montojo's fleet overtook Cervera's. But it was the loss of the control of the sea, not the capitulation of Santiago and its outlying garrisons, that terminated the war.

Doubtless the army contributed to the flight of the fleet through the ultimate prospect of a plunging fire, but it is not a sufficient defence to assert that the result justified the method. No one may carry flame in a powder magazine in the hope that there will be no explosion. The army in possession was vanquished by the army of invasion, but the victors were absolutely defeated by the climate. Such a foreordained consequence was in plain view from the beginning. Even Gen. Alger, wise after the event, writes (p. 283): "Our army would not have been sent to one of the most unhealthful sections of Cuba at the worst season of the year, but for the fact that the Spanish admiral took refuge in Santiago Harbor." The reason is not competent, and the consequences to the invader, calamitous as they were, might easily have been fatal, or, at the least, fruitful of even greater and more persistent disaster. A very slightly prolonged resistance would have brought into fiercer action uncontrollable disease, the intelligent dread of which, already present, was depicted in the famous Round Robin. That remarkable communication, which violates nearly every principle of military propriety, does not show, as would seem at the first blush, insubordination by the soldiers (admirable as were most of them) who signed it, but their clear appreciation of the calibre and disposition of the persons in authority. It was at once a spur for action and a bridle for guidance. Imagine such a letter being addressed to Grant or Lee, to Sheridan or Jackson! Imagine their troops in a predicament from which they could only thus be extricated. The Secretary objects not to the letter, but to its publication.

To throw a little further light on the fragmentary and inconsequential nature of the War Department's actions, one may not call them plans, we note without comment the following facts: (1) The double mission of material relief to the insurgents at Tunas and on the north coast of Cuba was given up from fear of the Spanish fleet; (2) the expedition against Mariel, as a base from which to move upon Havana, was also abandoned from the same cause; (3) that fleet, blockaded by Sampson, was no longer a factor to be feared; (4) the army was diverted to Santiago to assist in the capture of the fleet; (5) after destroying the fleet, it was proposed, not to lay siege to Havana with the victorious army and the supplementary forces, but to transport it to distant Porto Rico, whose fate necessarily depended upon that of Cuba, not Cuba's upon Porto Rico's. The ravages of disease forced upon the War Department the repatriation of the Fifth Corps, which was not one of its own measures.

The farce of organizing, and proclaiming as "immune," regiments that possessed no immunity in fact or in theory, the crimination against the navy, the embalmed-beef controversy, the condition of the great camps and the reasons therefor, are among the serious subjects of which space forbids discussion. Space also debars consideration of affairs in the Philippines, regardless of any question of statesmanship as to their occupation under the treaty.

POLYPHONIC MUSIC.

The Oxford History of Music. Volume I. The Polyphonic Period. Part I. Method of Musical Art, 330-1330. By H. E. Wooldridge, M.A. Oxford: Clarendon Press; New York: Henry Frowde. 1901.

The book of which this is the first volume is the first part of an extensive History of Music from A.D. 330 to the Romantic period, the period of Weber, Schumann, and Chopin. Professor Wooldridge has undertaken this part of the work, which the present volume carries to the period of Discant, inclusive.

In music, if we would find real continuity, we must overleap the Middle Ages, which are an intrusion and a parenthesis. They may be compared to a disease, or to a long aberration from the right path. This is so clearly illustrated in the present work, that, though it is often too technical to please readers not skilled in this particular art, it will appeal to the student of art in general, and even to the student of the philosophy of history. Professor Wooldridge divides the history of music into the three great periods of Homophony, Polyphony, and Harmony, marked respectively by the preëminence of the single melody, of combined but independent melodies, and of harmony. He traces polyphony to the octave-singing of mixed choruses of men and boys in the Greek period, and holds that it is positively proved that, while the Greeks knew other consonances besides the octave, they never used them for musical purposes. The author appears to hold the most correct views on the Greek modes and their relation to the universal scale of the ancients and to the Transposition scales of their theorists. Polyphony, then, sprang from the decadence of Greek music. At first the Church accepted the conditions transmitted from this decadent art. It took the materials of music as it found them, just as it appropriated the pagan temples and, to some extent, the pagan rites and superstitions.

After the complete triumph of the barbarian invaders, about the middle of the sixth century, there is an absolute hiatus in the history of music until about 850, when we find ecclesiastical music provided with a set of eight modes, retaining in their nomenclature clear traces of their Greek origin, but put together in a bungling manner, the source of which is found by the author in the Greek Church in Syria. This wrong view of the modes seems to have been corrected under the influence of Boethius; and it was after this reform that the development of the polyphonic principle first became possible, since now the materials of music first assumed a permanent shape. We have here one of those interferences on the part of ancient Greek music which, as Gevaert has justly observed, have occurred at every critical point in the history of this art. For Boethius was merely an interpreter, however inadequate, of Greek theories.

The author regards the advance of music from this point as due to a new emotional

principle, the congregational emotion appropriate to collective worship. It seems to us that he is thinking back from the standpoint of later modes of thought. The idea that congregational music ought, in its very structure, to typify the "e pluribus unum," so to speak, of the congregation, does not seem to us likely to have occurred *a priori* to the musicians of the ninth century; nor is there any proof alleged that this view was taken, even *a posteriori*, by any thinker of that age. The Christian congregation had existed for eight hundred years without, apparently, feeling any need of such a mode of expression; and during that period its religious fervor had certainly not grown stronger, but much weaker, than it had been in the Catacombs. We think that a truer explanation is to be found in the waning of genuine religious feeling. Real and profound religious emotion makes but slight demands on art of any sort, while conventional religion and genuine but shallow religious feeling need the aid of elaborate art, and of that self-delusion which mistakes sensuous impressions received from without for true spiritual and inward emotion. If we are not mistaken, we must, then, include the birth of polyphony in the chapter of those timely accidents of which genius, in every age, has so readily availed itself.

However this may be, the recognition of chords, or simultaneous consonances, first appears in the ninth century, and in a form which shows great advances in the interval between our extant records. New chords, and even discords, are admitted; and there is a greater independence of the vocal parts. The part-singing of this period is called Organum, or Diaphony. The parts might be four; but two were mere repetitions of the two others; of the principal voice one octave below, and of the lower voice one octave above. The author gives numerous examples of this Organum, in one of which (on page 55) there seems to be an error in transposition, E G (three semitones) being represented by F A (four semitones). The explanation of this, not given by Professor Wooldridge, may be that the mediæval theorist was transposing by scales and not, as we do, by notes. The Scholia Enchiriadis quoted on page 53 actually profess this view.

To the strict Organum succeeded, not much later, our author thinks, the free Organum, in which the accompanying voice did not always follow the principal voice note by note. The origin of this is found in the necessity of avoiding the tritone—an interval of three whole tones (as F B), which the musicians called "Diabolus in Musica," the Devil in Music. Here we see how faults in systems lead to new discoveries. This necessity of avoiding the "Diabolus" caused a long stride to be made toward the still unsuspected goal of polyphony; that which had been resorted to as a remedy being now adopted for its own sake.

Guido d'Arezzo is now the chief exponent of musical theories; for we have reached the eleventh century. The intervals used to avoid the tritone are now studied and freely used, an advance which our author inclines to attribute to the readoption of the Greek scale. We are more inclined to see in it an effort to shake off theoretical dogmatism, a common phenomenon in the progress of all art, where Nature and Truth are ever protesting against canons of human invention. Guido yielded to this superior guidance, and the hesitancy and inconsistency of his alleged reasons are only a tribute to the authority of prevailing methods and prejudices.

Professor Wooldridge seems to undervalue the part of Guido in the advance of the musical art of the age. It is true that, after his death (about 1050), there was a reaction. The "passing" discords allowed between consonances disappear; and, in the new Organum, first expounded about 1100, there is a return to strict consonances. Variety is obtained only by the use of different modes of progression. But this led to constant efforts to write many different vocal accompaniments to one and the same melody, and the result was the creation of real third and fourth parts, no longer, as before, mere repetitions of the principal part and its Organum. Here, as the author himself admits, real progress was made by the irregular Organum of certain pieces in which all prohibitions against dissonances were disregarded. So that Guido, after all, had not wrought in vain.

The subject of Discant, or measured music, in which the consideration of rhythm (*i. e., tempo* apart from its speed) held the first place, is too technical to be discussed here; and the same may be said of the chapters on notation, in which the author has put some of his best work. The strict rhythms of this period are sometimes agreeable; but they confined composition unnecessarily and were doomed to a speedy end, like all arbitrary restraints in art, the true progress of which always lies in judiciously breaking rules. Their monotony led to violations, or to clever evasions, of the rules; and these soon became the usual practice. The free use of consonances led to new views as to the movement of the voices; and, at a time roughly estimated as between 1290 and 1300, we see Discant coming very near to plain Counterpoint. The elements of composition were still Tenor and Discant, but the Discant was no longer metrically enslaved to the "subject." Consonances were required in the strong beat of the measure only. "Composition at this time [with which this volume closes] was weak and tentative, deficient in resource, hampered by its conditions—the effect harsh, empty, and harmonically pointless." The prevailing forms of composition were the two kinds of Organum, the Cantilena, the Rondel, the Motett, the Hoquet, and the Conductus; the last two being to us mere names.

The Rondel will interest every reader who knows or enjoys music. The most famous example, the English rondel "Sumer is icumen in" (date about 1240), given here in several versions, is a composition of which any age or any people might be proud. The nameless author may be classed with the many great men who are personally unknown to us *quia vate carent*. The volume ends with many examples of rondels and motetts, covering some seventy pages.

Of Professor Wooldridge's work we cannot speak too highly. It is difficult to overstate the enormous labor and difficulty involved in unravelling the tangled mass of facts with which he had to deal; and the result is more satisfactory than could have been expected even from such diligence and so much ability. The "make-up" of the book is what we have learned to expect from the Clarendon Press. We have noted very few misprints, and those of no great consequence, as "Sancta Spiritus" on p. 378. One curious mistake seems, however, to have been made in the account given of the manuscript in the Laurentian Library, at Florence, from which so much of the author's material is drawn that, without it, this book could not have been written. We are told that the MS. is marked "Plutarch 29. 1." Now, a dialogue on Music is indeed found among the works of Plutarch; but this MS. does not contain a line of it. On the other hand, the MSS. in the original Laurentiana are all marked "Plut.," with two numerals following; the letters "Plut." standing for some form of the word *pluteus*, which merely means a book-case.

Studies of Trees in Winter: A Description of Deciduous Trees of Northeastern America. By Annie Oakes Huntington. With an introduction by Charles Sprague Sargent, LL.D., Director of the Arnold Arboretum and Author of 'The Silva of North America.' Illustrated with colored plates and photographs. Boston: Knight & Millet. 1902.

A Handbook of the Trees of New England. By Lorin L. Dame and Henry Brooks. Boston: Ginn & Co. 1902.

Those of our readers to whom it was permitted to make use of the excellent 'Arboretum et Fruticetum Britannicum' of Loudon can never forget the pleasure given by the winter days when, through the windows, the leafless branches of the trees, still or swaying, served as fascinating objects of comparison with the sketches in the book. The eight volumes of Loudon were not convenient handbooks for field use, and therefore gave one an additional excuse for staying by the open fire, indoors. The 'Studies of Trees in Winter,' brought within convenient compass of a manual, must take away this excuse for fireside examination of our beautiful winter vegetation. One can now enjoy the study of our oaks and maples and ashes in the crisp bracing air of the lengthening days. It is possible for even the least observant person to familiarize himself with the more common of our trees in winter, and watch the coming of the miracle of spring.

It is well known to all thoughtful persons that the buds of our trees and shrubs represent the most admirable adaptation to surroundings. In the equatorial belt, where plants have the weather quite their own way, and where, year in and year out, they take no thought for hard times coming, buds, in our Northern sense of the word, have scarcely any existence. Our buds stand as examples of survival, through countless generations, of the hardy stocks which could meet sudden emergencies in the most variable climates. Alfred Russel Wallace and Grant Allen have found in buds illustrations of deep interest touching the great subjects of variation and survival which they have had most at heart. An attentive examination of the myriad forms of buds, identifiable by means of this admirable work, will add much to the interest of the winter walks until the coming of the spring. And then can be substituted for this study the use of the handy book on 'The Trees of New England' by Dr. Dame and Mr. Brooks. These authors have covered the ground in an attractive and successful manner. Their descriptions are truthful

and interesting, their plates are excellent, and, in short, they have produced a convenient and safe guide. We congratulate the lovers of trees in our Northern States upon the admirable textbooks which are now within very easy reach.

There are many encouraging signs of a deepening interest in our trees as trees, and in forests as a precious heritage. Every good handbook which serves to increase this interest must be heartily welcomed.

A Dictionary of Architecture and Building: Biographical, Historical, and Descriptive. By Russell Sturgis and Many Architects, Painters, Engineers, and Other Expert Writers, American and Foreign. In three volumes. Vol. III., O-Z. The Macmillan Co. 1902.

The appearance of this third volume marks the completion of a work which will doubtless for many years remain the standard encyclopædic dictionary of the subject. Upon the appearance of the first volume, we described in these columns the form and scope of the undertaking. We will now confine ourselves to some account of the contents of the third volume. The Dictionary, as a whole, is marked by the fortunate selection of its writers, and the appropriateness of these selections is no less evident in the third than it was in the preceding volumes. To take a single case: the whole subject of the use of colored glass in windows has been committed to the care of Mr. John La Farge, who has approached the matter not merely as an historian (for as such he treats it with all necessary fulness), but as an artist familiar with the technique of the material and the limitations and possibilities of the art of the window-maker. The part of his article devoted to the colored window in America is particularly interesting, since Mr. La Farge was among the foremost in developing that art. He therefore speaks from an intimate knowledge of the aims of the early workers and the difficulties they had to overcome.

Among the articles in the present volume upon the history of Architecture, the most notable are those of Mr. R. Phené Spiers upon Roman Imperial Architecture and upon the architecture of certain Eastern countries; of Mr. C. H. Blackall on Spain and Portugal, of Prof. A. D. F. Hamlin on Scotland, and of Professor Frothingham on Sicily. The latter writer also contributes an article on Pelasgic architecture, which he defines as a style of building prevailing in the pre-Hellenic world, in addition to two styles of early date, found one in the valley of the Nile, the other in the valley of the Euphrates. Probably the longest single article in the present volume is that upon Architecture in the United States, being Mr. Montgomery Schuyler's exhaustive treatment of the subject from pre-Columbian times to the present day. Nor should we fail to mention Mr. W. P. P. Longfellow's article on Romanesque Architecture, or his still more interesting treatment of the subject of Round churches. Among articles dealing with parts of buildings are especially to be noted two by Professor Babcock, one on Pendentive, the other on Vault, both particularly to be commended by reason of the exhaustive series of diagrams with which they are illustrated. These diagrams, although they would have been equally useful had they been given at a much smaller scale (a statement true of nine-tenths of the illustrations in the Dictionary), form with their succinct text so valuable a presentation of their subjects that one regrets that the same method has not been employed more generally throughout the work.

Upon Æsthetics the chief article contained in the present volume is that of Mr. Henry Rutgers Marshall on "Truth in Architecture," a discussion of the expression, in design, of the essential facts of the plan and structure. The most important article on building materials is that by Prof. George P. Merrill on Stone, an inquiry into the nature, use, and source of the stones most frequently employed in construction, with special reference to those occurring in the United States.

It need only be added that the great mass of definitions and of brief articles contributed by the Editor is up to the standard of the earlier volumes, and that the biographies of architects are as complete as heretofore, to show that the work has been carried to a conclusion in precisely as satisfactory a manner as the first volume justified us in anticipating.

Letters on Life. By Claudius Clear (Dr. W. Robertson Nicoll). Dodd, Mead & Co. 1901.

Only a hardened critic could refrain from laying aside his scalpel when an author, in his first chapter, makes a clean breast of his own ideals by declaring that "the highest wisdom is to be found in commonplaces." Dr. Nicoll has here suggested the obvious comment on such statements as that there cannot be good conversation between two people unless they are united by a feeling of sympathy; that many persons have their heads turned by sudden success; that the first condition of learning is humility; that it is perhaps wise now and then to have a pause if one is engaged in work which strains one's faculties; that what is work to one man is play to another; that it often happens that one who writes brilliantly does not talk in the same way; that men who are charming in society may be boors at home, etc., etc. Yet, in spite of its likeness in this respect to the immortal masterpiece of Martin F. Tupper, this volume is not only readable but even stimulating. Its commonplaces are presented as "confirmed and illuminated by experience." Dr. Nicoll's illustrations are drawn from a wide range, from Rousseau to Mrs. Oliphant, and some of the best are incidents related as having happened to friends of his own. The author shows his belief in his proposition "that literature is autobiography" by adding that personal element which is essential to good essays. His confessions respecting his visit to a palmist, his weariness of the sunshine of the Riviera, and his inability to make notes of what he reads, were well worth putting on record for the encouragement of weaker brethren.

The leading characteristic of the book is a homely and kindly good sense, expressed in a clear and unpretentious style and relieved by a pawky Scotch humor. With all its platitudes, not a few shrewd hints are scattered here and there; as, for instance, that many people would be much better talkers if they could even slightly enlarge their vocabulary, and that the holiday that does us most good is not the one we enjoy most, but the dull holiday. Dr. Nicoll is to be congratulated also on his skill in the choice of topics. Such titles as "On the Art of Taking Things Coolly," "The Sin of Overwork," "How to Remember and How to Forget," and "Should Old Letters be Kept?" whet the reader's appetite immediately, and it is not disappointed by the manner in which these subjects are treated. The lessons of "the American invasion" are expounded in three papers, one of which is based on Elbert Hubbard's 'Message to Garcia,' though Mr. Hubbard will probably regret to learn that the name of the author of that famous pamphlet is not given. The points in our own business policy which Dr. Nicoll especially approves are that American employers fire out the fools, pay good men well, and take good men into their confidence. Elsewhere Dr. Nicoll expresses the opinion that "America is not nearly enthusiastic enough about her choicest spirits," and alleges in evidence the neglect at Litchfield of the Beecher traditions of the place. We learn with much pleasure that the author's domestic cat, which can endure listening to most of the minor poets, could not stand some of the Laureate's "laborious trash" about the union between England and America, but deliberately left the room after hearing two stanzas.

The Labyrinth of the World and the Paradise of the Heart. By John Amos Komensky (Comenius). Edited and translated by Count Lützow. E. P. Dutton & Co. 1901.

Comenius is famous as an educational reformer; his memory has been piously cherished by the Moravians, and something of his travels and trials is generally known. But what his compatriots regard as his most important book—more valuable than the 'Janua Linguarum,' which was long used in schools, or the 'Orbispectus,' or his later "pansophic" works—has been little known except to Bohemians. 'The Labyrinth of the World' was written in 1623, and first printed in 1631, "probably either at Lissa or at Pirna in Saxony." An enlarged edition appeared at Amsterdam in 1663, and was reprinted at Berlin in 1757, and at Prague, 1782 and 1809; this last edition was suppressed in 1820. Within the last half century there have been many editions, always in Bohemian. German translations, abridged or adapted, appeared in 1781, 1787, and about 1872. Others exist in Hungarian and Russian. Count Lützow, of the Bohemian Academy, now publishes a careful English version. His apologies, as writing in a language not his own, are unnecessary, for his work is well done, and discloses to "the largest public of readers in the world" what is at the least a literary curiosity, and (as he assures us) a beloved national classic. Parts of it are now read in the Bohemian schools for the style; and the song of the Bohemian exiles celebrates it with their vernacular Scriptures: "Nothing have we taken with us, everything is lost; we have but our Bible of Kralice and our 'Labyrinth of the World.'"

The 'Labyrinth' is a satirical allegory, introducing a shorter devotional work. The author, in his dedication to his patron, the Baron of Zerotin, says, "The first part depicts the follies and insanity of the world, showing how, mainly and with great labor,

it busies itself with worthless things, and how all these things at last end wretchedly, either in laughter or in tears. The second part describes, partly as through a veil, partly openly, the true and firm felicity of the sons of God." The main part somewhat resembles 'Pilgrim's Progress,' and still more the 'Table of Cebes,' which the writer may have known. It is deeply pessimistic, the work of a scholar who had recently seen his religion crushed, his house and library burned, himself, his family and friends driven forth. The translator claims that it offers "an almost perfect picture of the life and thought of Bohemia and Germany . . . in the early years of the seventeenth century." It bears the marks of a strong and even fair mind; it is curiously free from bigotry and "doctrines"; it represents Christendom as a great church with "many little chapels, to which those went who had not been able to agree." The book is one of the few allegories which tend to more than mere edification. The introduction includes a sketch of Komensky's life by which the usual notices of him may be corrected.

The Laws of Scientific Hand-Reading: A Practical Treatise on the Art commonly called Palmistry. By William G. Benham. G. P. Putnam's Sons. 1901. Large 8vo, pp. 635, with 800 illustrations from life.

Either as a manual of instruction for the learner or as a book of reference for the more expert, palmists are indebted to Dr. Benham for one of the most desirable works on their subject. Illustrations and text are good, abundant, and handsomely published. The treatment appears to be original, and is largely the outcome of an unusually varied experience by a practising physician. The discussions are modern; the earlier literature is advantageously neglected. Continued study of the diseased and abnormal may have too much influence on conclusions, yet the knowledge thus gained is of great importance to one whose business it is to weigh small departures from normal conditions. The word scientific in the title is not to be taken as indicating that the art has become a branch of science; that is not possible while so much reliance is placed on mystification and the tricks of the trade. What science there is in palmistry would be better received if not discredited by deception and trickery. In the main the facts are not secured from the hand. The organ may tell whether its owner is a laborer or an idler; its neatness or want of it may decide whether he is an affluent or a lazy idler, and so on; nails, hairs, color, hardness, and the like may tell something, yet general carriage, manners, appearance, shapes, clothes, speech, attitudes, and other features all are made to contribute to a story that in pretence is read off the hand.

There is here good display of the sources of information and of methods of securing and of using it. The instructions for interpreting the lines, mounts, and other points of the palm are very complete, without increasing our respect. It needs little more than the injunctions to the learner to set the so-called art in its true light. One is told to adapt the line to the subject, not the subject to the line; the latter is said to be accurate only when the subject is first understood, and the line applied to him—the interpretation of the line must depend entirely on the kind of subject on which it is seen; laziness or bile may destroy any amount of genuine ability. In a way this may be scientific; it is different with such formulas as—faint lines just beginning to form show emotions just starting to develop; or, the presence of the line of Apollo makes success easier; or, where the hair has been made white by shock you will find a broken or islanded head line; or, in the head line it has been found that the inner workings of the mind are disclosed, etc., etc. A really scientific palmistry would be less attractive to gypsies and other fortune-tellers, and to their dupes, and would drop the gabble about Jupiter, Saturn, Apollo, Mars, Mercury, Venus, and the moon; but how much more honest it would be!

BOOKS OF THE WEEK.

Benjamin, C. T. Selections from Irving's Sketch-Book. (Regents' Edition.) American Book Co. 50 cents.

A Most Important Work of Fiction

By a new Author

THE story is so remarkable a one, and will be produced in so beautiful a form, that the publishers confidently predict for it an immediate and unqualified success.

The story has a real hero.
The story has a heroine worthy the hero.
The story has action.
The story has color.
The story has an heroic period for its setting.
The story has a vivid atmosphere.
The story has characters that live and breathe.
The story has a purpose.
The story has genuine "heart interest."
The story has the spirit of adventure.
The story has the deepest historical interest for every American.

The Thrall of Leif the Lucky

A Story of Viking Days
By Ottilie A. Liljencrantz

THE volume will be richly illustrated in colors from original paintings by Troy & Margaret Kinney, who have also prepared a striking title-page, quaint end-leaf designs and curious initial letters.

The BOOK for PRINCE HENRY

A little episode, interesting to the literary world, occurred recently in Berlin. Prince Henry of Prussia called at the American Embassy to discuss with Ambassador White his projected tour in the United States of America. His Highness is keenly interested in being well posted beforehand. In the course of his visit the Prince was recommended to peruse the standard handbook by Bryce, and was urged to read also

AMERICA THE LAND OF CONTRASTS

By James Fullarton Muirhead

New Edition. 12mo. $1.20 net

Being "A Briton's View of his American Kin."

The author is well fitted to write on American Life and Customs, being a much "travelled" man, whose wife is a member of a well-known Boston family. Indeed, his book is gallantly dedicated "To the Land that has Given me what makes Life most worth Living."

THE Forty-second Annual Statement of **The Washington Life Insurance Company** reveals a most satisfactory condition of its affairs. The foundation of substantial securities on which its policies rest, tested by the most exacting standard, compels unquestioned faith in its ability to fulfil the promises made to its large and well-satisfied body of policy-holders. During the year covered by this annual statement, the Company has paid for death claims, endowments, and dividends, $2,189,603.96. The advanced rentals of the Company's superb Home Office Building and increasing income from other sources without the aid of speculative ventures are practical endorsements of its business methods.

Since its organization the Company has paid to policy-holders $37,727,309.72; the beneficent results of a trust so faithfully executed and promptly dispensed along more than forty years cannot be overestimated. The money disbursed to the holders of its policies for the benefit of their families and for their own maintenance (by matured endowments) together with invested funds aggregates $53,960,173.33, including a sufficient sum, securely invested, even on the assumption of a low interest rate, to provide ample security for over $61,000,000 of insurance.

Its liberal and just treatment personally of individuals by prompt payment of claims, dividends, and surrender values, abundantly sustains a reputation for which this Company has always been conspicuous.

The Company's cheerful compliance with the reasonable requests of its policyholders is seen in the loans made on their policies, whereby prompt assistance has been afforded and relief extended, frequently preventing loss of insurance; a sufficient proof to the public that sound insurance may be had, and an unmistakable guide as to where to get it.

AN EDUCATIONAL DIRECTORY

I.—The NATION stands alone in its field. It has the largest circulation of any literary and political journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in the NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

Ginn & Company's Latest Books

Analytical Psychology

A Practical Manual for Colleges, Normal and High Schools, presenting the Facts and Principles of Mental Analysis in the Form of Simple Illustrations and Experiments. By LIGHTNER WITMER, Assistant Professor of Psychology in the University of Pennsylvania. xxvi+251 pages+8 charts. Ready Feb. 15th.

In this book the facts and fundamental principles of psychology are presented in clear, precise, and, as far as possible, non-technical language. The method of presentation departs considerably from that of the formal text-book. Experiments which the student is required to perform are described so explicitly that they may be performed without much supplementary assistance from the instructor. Forty specially prepared charts are bound in with the manual and serve as material with which the student may perform the experiments required.

A Course in Invertebrate Zoölogy

A Guide to the Dissection and Comparative Study of Invertebrate Animals

By HENRY S. PRATT, Professor of Biology in Haverford College, Pa., and Instructor in Comparative Anatomy at the Marine Biological Laboratory at Cold Spring Harbor, Long Island. Mailing price, $1.35.

Specific directions for the dissection of thirty-four invertebrate animals are included in this book. Each of the larger groups of invertebrates is studied as a whole. By thus avoiding the detached types of the different groups, the attention is constantly directed to the structural features which characterize the entire group under consideration.

The work is adapted for use in colleges and normal schools.

Herbarium and Plant Description

With Directions for Collecting, Pressing, and Mounting Specimens

By W. H. D. MEIER, Superintendent of Schools, Griggsville, Ill. Portfolio containing 25 sheets for description and preservation of specimens. Mailing price, 70 cents.

Spanish and English Conversation

First Book. By AIDA EDMONDS PINNEY. xv + 111 pages. Mailing price, 65 cents. (Book I. now ready; Book II. ready in March.)

The exercises and reading material in these two books are given in both Spanish and English. The volumes aim to teach the spoken language, the words and sentences being those used in everyday intercourse.

THE BAKER & TAYLOR CO., New York.

Back Numbers of "The Nation."

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but will bring very little in proportion if a single number is missing. Volumes II. and III. are also scarce, but not so high-priced as the first.

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to Mr. J. W. Christopher, 47 Dey St., or Mr. A. S. Clark, 174 Fulton St., New York.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half year. Two volumes per year have since been issued, Vol. LXXIII. comprising the last half year of 1901.]

The Nation.

NEW YORK, THURSDAY, FEBRUARY 20, 1902.

The Week.

A day was saved in securing some action for the relief of Cuba by the unexpected passage in the House on Monday of the bill repealing all the war taxes, without further debate. Representative Richardson, the leader of the Democratic minority, gave the majority a real surprise by his proposition not to waste time in a discussion which must have been purely academic and perfunctory, since the Republican managers would not allow even a chance for a vote on any amendment. The gross injustice of such methods could perhaps not be so clearly demonstrated by speeches of protest as by this somewhat spectacular method of showing the country how utterly the House has ceased to be a deliberative body. The real responsibility for defining the legislative policy of the Government regarding taxation is deliberately thrown by the lower branch of Congress upon the upper by this action. It is another of those steps by which the House is steadily abdicating influence and power. If the Republican managers in the lower branch propose to take the initiative in reducing the tariff on imports from Cuba, there is no longer any excuse for their delaying action. If, on the other hand, they propose to go on surrendering their prerogatives to the Senate, that branch can the more quickly put through some proposition and send it to the House for acceptance, according to what has become too much the custom. The essential thing is that, by one branch or other, something shall be done for the relief of Cuba at once. The nation is impatient with a Congress which has already sat for nearly three months without discharging the most pressing duty that was laid upon it.

Great has been the flutter caused by the German story that Lord Pauncefote, on April 14, 1898, drew up a note in terms that would have been offensive to the United States—an inconsiderate and dangerous action, which was only thwarted by wiser heads, more particularly those in charge of the German Foreign Office. We cannot greatly blame the Germans for saying that Lord Cranborne, in contradicting the story, came pretty near a verbal quibble in the first place, and then, to save himself, made a scapegoat of Lord Pauncefote. On February 11 Lord Cranborne said in the Commons that England had never, "through her Majesty's Ambassador or otherwise, proposed any declaration adverse to the action of the United States in Cuba." On February 14, apparently after hearing from Lord Pauncefote, the official statement was that he had acted "entirely on his own initiative." This is dangerously near Von Holleben's own phrase about the "initiative" of the British Ambassador. It leaves Lord Cranborne's first statement technically correct, but also leaves the British Foreign Office looking as if it did not quite know what its Ambassador had done "entirely on his own initiative." Such embarrassments are sure to follow when this undignified and irregular way of blurting out diplomatic secrets is fallen into. We quite agree with those English critics of the British Government who say that such half-revelations are wholly improper, and can lead only to international cross-purposes and ill feeling. In the nature of the case, a clean breast cannot be made, and the method of hint and innuendo and fragment ought not to be adopted by a diplomacy that thoroughly respects itself. Quite obviously, the Von Holleben dispatch was published less for the text than for the Kaiser's marginal comment, to the effect that the proposed note was "completely futile and purposeless." This falls pat with the imminence of Prince Henry's visit, and it shows that the German Ambassador and the Kaiser, in view of a desperate situation at Washington, took the wise and friendly course. It was natural that Germany should wish this to be known, and every American should be glad to know it.

But it behooves every American also to recall that every representative of a foreign Power at that memorable conference agreed that the intervention of this Government in Cuba was unjustifiable; that the dispatch of April 10 from the Spanish Foreign Minister had fully met all the demands of Congress, and completely "removed all legitimate cause for war." Right here is a strange anomaly. Every Ambassador at Washington knew of Señor Bernabé's frank and conciliatory note. Not a member of that Congress with which the issues of peace and war then rested had been informed of its *full* significance. Mr. McKinley in the White House knew from Gen. Woodford's dispatch of April 5, which he never communicated (nor was it published till three years had passed), that the basis for a fair adjustment existed; the State Department also knew it. Not another citizen of the United States knew what ought to have been proclaimed from the housetops—that Spain had yielded at nearly every point. It is a murky and disagreeable corner of our diplomatic history, upon which recent discussions of the ante-bellum negotiations have shed a more certain light. To say that England or Germany or any other Power was our friend at that time, means only that it recognized the hopelessness and the positive danger of interfering with a nation lashed to a fury by the sensational press.

Who shall depict the consequences of Secretary Long's speech at Boston on February 12, and especially its effect upon the Filipino mind? It was on the anniversary of Lincoln's birthday, and the Secretary was inspired by the occasion to say that our work of pacification and of instruction in self-government in the Philippines is the work not of a day but of a generation, and he continued in the following phrase:

> "When the time comes that the trust is executed and the ability of self-government is assured, then the question of their political status will be for the people of those islands themselves to decide. Whether they will walk alone and independent, or whether they will walk hand in hand with us as Canada walks with England, they—whoever they shall then be—will decide. And as England respects the wishes of Canada in this regard, so shall we then respect, and ought to respect, the wishes of the Philippines."

This is exactly the kind of talk that Gov. Taft and our chief military authorities, and eke Senator Platt of Connecticut, say is exciting the insurgents to fresh resistance, and undoing the work of our soldiers, and leading to more bloodshed. The Secretary has said in so many words that it will be for the Filipinos themselves to decide whether they shall be an independent nation or shall hold to us the relation that Canada holds to Great Britain. He takes the same position that President Schurman took in his recent address, except as to the time when the Filipinos shall decide the question. Between Secretary Long and Mr. Schurman there is no difference of principle, but only of the time when the Filipinos shall be really fit to govern themselves. Both say that, when they are fit for independence, they shall have it. Whenever such words are spoken by authority of the Government of the United States, the reign of real peace in the Philippines will begin.

Senator Hoar was in his best form in his debate last week with Senator Platt of Connecticut on Philippine affairs. The question under discussion—and the only one in which the American people take much interest—was whether the conditions in the so-called pacified provinces are due to the reconcilement of the inhabitants to American rule, or to the crushing force of our arms. Senator Platt pointed in a triumphant way to the fact that our forces had been reduced from 70,000 men to 40,000, and wanted to know whether that would have been possible if the people were still discontented. Mr. Hoar replied that the

Filipinos had been disarmed, and that a people without arms might be just as hostile as before and yet seem to be pacified. It is well known that the practice of torture known as the "water cure" was put in force in the Philippines expressly to compel the natives to tell where their arms were hidden, and that it was successful in cases where all other means failed. It is not unlikely that a people who have been led to expect the "water cure" as the punishment for having arms, would have intervals of quiescence sufficient to warrant the belief among credulous people on the other side of the globe that they were really reconciled to their conquerors. How the pacification has been brought about was told by Gen. MacArthur in a pregnant paragraph of his final report:

> "The American army has, up to date, secured some 23,000 guns, and in all probability will secure several thousand more."

This is not pacification, but repression.

It is obvious that the decision regarding the Southern question which was reached by the caucus of the Republican Congressmen on Monday night means the abandonment of any serious effort to reduce the representation, in the House and in the electoral college, of States that have adopted Constitutions under which negro suffrage is restricted. A committee of eleven is to be appointed by the Speaker to examine the election laws of the several States and their enforcement, find whether the right of citizens to vote is denied or abridged, and report the results of its investigations. This outcome was accepted by Representatives who have advocated more radical action, while it is entirely satisfactory to Congressman Cannon and other veteran Republican leaders who are earnestly opposed to any attempt at legislation. The inquiry can do no harm, and the investigators themselves are likely to have a more realizing sense of the hopelessness of doing anything after they have studied the question than before.

Secretary Root's latest bill for the improvement of the army, sent to Congress on Friday last, contains by far the most important reforms of the many which have been urged by him since he entered the Cabinet. The bill provides for a large number of changes, but the significant ones are those consolidating the supply departments and creating a general staff. The reforms that Secretary Root has thus far been able to bring about have made for the modernization of different parts of the military organization, such as bringing staff and line into closer touch, and introducing the three-battalion system for the infantry as well as the cavalry. But the greatest deficiency in the army since 1870 has been the absence of a set of officers to plan for the future—to be, as in European armies, the eyes, the ears, and the brains of the service. The necessity for such a staff was made patent to the world by Von Moltke; the need has been officially recognized in this country only since Secretary Root took office; the Spanish war having demonstrated, even to the most partisan mind, the antiquated character of the American military machine.

Under Secretary Root's plan the "General Staff Corps" will consider the military policy of the country, and prepare comprehensive plans for the national defence and for the mobilization of the military forces in times of war." It is also to have supervision of the coöperation of army and navy, of plans of campaign, of the securing and utilization of military information, of the system of army education, armament, equipment, etc. The consolidation of the existing staff departments is still further carried on by the gradual amalgamation of the Inspector-General's Department and the general staff, and the assumption of the duty of inspection by the new body. When the general staff has been created, the officers of the Adjutant-General's Department, now under Gen. Corbin's leadership—the most important part of the staff—will return to their proper positions as military clerks pure and simple. The head of the general staff is to be a lieutenant-general, and after Gen. Miles's retirement in 1903 this officer is to be selected from the generals of the army by the President for a period of four years. The rest of the general staff will comprise one major-general, one brigadier-general, four colonels, six lieutenant-colonels, twelve majors, and twelve captains, all likewise serving for four years, and then returning to their permanent positions in line or staff. It is characteristic of the simplicity of Secretary Root's reforms that the bill does not call for any additional expense, except such as is required for the construction of a home for the general staff at Washington Barracks.

Senator Hanna, in the guise of a "successful merchant," rises to protest against the removal of the war taxes. That surplus in the till has no terrors for him. On the contrary, he dreads lest there be a deficit after all the appropriations for an Isthmian canal and "other great projects" (*scilicet* ship subsidies) are made. Coming down to particulars, he asks if it would be wise to "repeal the beer tax, to the neglect of the American merchant marine." Of course, Senator Hanna is a friend of beer. It would not be "wise," in his sense of wisdom—the political sense—for him not to be. But it is another kind of "schooner" that holds his warmest devotion. If the "oceans of beer" which the prohibitionists see in their excited imaginations were only real, and Mr. Hanna could arrange to have subsidized ships carry the American flag over those foaming billows, he could develop a beautiful theory of community of interest between himself and what he somewhat disparagingly calls "the brewing interests." As it is, however, he thinks that the brewers are getting more of the Treasury surplus than the subsidy beggars, and hence his angry protest against a manifest injustice.

We welcome the shoddy-dealers to the ranks of the free-traders. They have blundered into the procession, to be sure, and their banner carries a protectionist device, but the laughter which they will create all along the line will be worth many an argument. Funnier still, they must stay with the free-traders or march by themselves. The protectionists will have none of them, with their opposition to Representative Grosvenor's bill for the labelling of woollen goods as all wool or part shoddy. Such a measure, say the shoddy-dealers, would ruin their business, and it is quite a business, too—large enough to organize itself into the National Association of Cotton and Wool Waste and Shoddy-Dealers, and strong enough to petition Congress for protection to its interests. And why, Mr. Grosvenor and the Ohio shepherds may be asked, should it not be protected? Is it not a domestic industry, and is it not more worthy of the title "infant industry" than the woollen business? Besides, we must have shoddy, if Grosvenor *et al.* will not let us have wool, and we prefer it without the disquieting label. If it must be labelled, however, how would "Made in America" do?

Prince Henry's coming will bring out one striking advantage of a reform Administration, that of having a Mayor and officers who represent the city creditably. For four years past the Mayor of the city has rarely represented New York as New York deserved to be represented. The boorishness which the late Mayor possibly simulated for political effect, was bitterly resented, and contributed doubtless to his crushing defeat. His feeling was a little that of the genial and exuberant Congressman from Kentucky, who, in his imagination, "boots out" Secretaries of State and orders back foreign ambassadors. "We have made ourselves a laughing stock at every court in Europe," says Congressman Wheeler, "because of our flunkyism, our *truculency*, and the disgraceful sycophancy of the representatives of the republic at the feet of Great Britain." Let us pause a moment upon that beautiful word *truculency* by which the Congressman so aptly and originally describes the grovelling abasement of Mr. Hay at the Court of St. James. We want

no "truculency" in the Kentucky sense. It is a laughable and an odious thing. But "truculency" in the unadorned dictionary sense is also a ridiculous thing, and hardly less contemptible. That kind has been more than once shown at the City Hall to distinguished guests of the city. It is matter for genuine rejoicing that neither kind of "truculency" will be seen at the City Hall during the present Administration. Prince Henry, or any other distinguished foreign guest, will receive from Mayor Low the most democratic of welcomes—the welcome which one gentleman gives another. This, in spite of old-school Tammany politicians and golden-tongued Kentucky Congressmen, is the American way of greeting an obscure or a titled guest.

A much needed amendment to the city charter, covering the appointment of architects for city work, has been introduced at Albany, and should be promptly passed. The Davis bill simply applies to the choice of architects the well-tried principle of an eligible list. The Fine Arts Federation, an institution of high professional standing, is to designate one hundred architects who, in its judgment, are competent to do work for the city. From this list the Mayor is to select fifty, and during his term no building for the city shall be intrusted to any architect not on this second list. We understand, however, that the fact of such a list would not prevent the holding of open architectural competitions, whenever that method should seem desirable. Non-residents, as well as residents, may be nominated by the Federation and the Mayor, which insures, or rather permits, a sufficient catholicity of selection. The object of the amendment is simply to obtain a reasonable standard of architectural merit in public buildings, and to make impossible the rising up of new Horgans and Slatterys. With these objects all good citizens and the Legislature cannot fail to be in sympathy.

The figures of the country's foreign trade in January are really extraordinary. To understand their meaning, it should be noticed that, in the full calendar year 1901, our exports of manufactured goods decreased $46,000,000, and of other non-agricultural products, $4,000,000, but that an increase of $35,000,000 in agricultural experts offset much the greater part of these declines. That such an increase in products of agriculture should have occurred, in the face of $34,000,000 shrinkage in corn exports, was remarkable enough, and was due solely to the very large increase in the outward movement of our wheat. Now, as it happened, wheat exports themselves, at the beginning of 1902, fell off decidedly. They were smaller by 20 to 30 per cent. than in January, 1901, and the whole export trade in agricultural commodities consequently decreased $7,500,000. It might, then, have been supposed that the total decline in exports for the month would be very large. It appears, on the contrary, that the month's entire decrease in exports is measured by the decrease in agricultural products. In other words, shipments of manufactured and other non-agricultural goods, last month, were fully as great as in 1901. When the present trade situation is considered—the decrease in foreign demand, the immense expansion of home consumption in such commodities as iron and steel, and the consequent normal tendency of manufactured exports to decrease—the fact that no decline at all is shown is indeed singular. It is all the more singular from the fact that present prices, from which these export values are computed, are in many commodities 10 to 20 per cent. below last year's—which would naturally make the expected decrease larger. The conclusion which people will probably draw from these returns is that the country's grasp on competitive export trade is stronger even than had been supposed. The seeming anomaly of the case is not lessened by the fact that this trade report appears at a moment when preparations are in progress for large imports of foreign steel and iron, made necessary by the present inability of our manufacturers to meet demands.

The Ontario prohibition bill, which has been introduced by Premier Ross as a non-contentious measure, is a curious example of drastic legislation mitigated by all the law's delays. The bill is simply the Manitoba prohibition act, a measure which has had an unusual history. The Manitoba law forbade, in the most stringent terms, the sale of liquor. Neither hotels, clubs, nor boarding-houses were exempted from its provisions. Invalids might, upon a doctor's prescription, keep liquor in their rooms, but they must not permit any other person to drink it. Premier Ross of Ontario had promised, if the Manitoba act were sustained by the courts, to introduce a similar measure in Parliament. Now that the courts have declared the act Constitutional, the Premier finds himself in the position of being obliged to keep an embarrassing promise. Even in Manitoba the Government has not ventured to apply the act, but is asking for a referendum which shall assure it that the people approve not only the law, but its enforcement. Premier Ross, then, is in the unfortunate position of introducing a bill which, enacted into law in another province, nobody has dared to put in effect.

Considering the necessary awkwardness of the situation, the Premier has managed very skilfully to avoid immediate conflict. The bill is to be presented on the second Tuesday of next October to the voters of the province. That the referendum may be valid, one-half of the voters on the lists must vote; and if a majority are for the measure, it will become law by proclamation, to go into effect, however, only after May 1, 1904, a year and a half after its enactment. Whether Premier Ross will be able to maintain the theory that this is a non-contentious measure is more than doubtful. Already the Conservative papers are pointing out, very justly, that legislation by referendum is of doubtful constitutionality, while it is certainly repugnant to the whole theory of Parliamentary government. In putting off the decision for some months the Premier of Ontario shows that he knows the value of a Fabian policy. Meanwhile the Government of Manitoba may take heart to enforce its own law. If the law, as is very likely to be the case, proves unworkable in a rural community, it will be obviously absurd to try it in the cities of Ontario. Premier Ross is likely to be spared the humiliation of passing a law which nobody wishes enforced, but his present predicament shows how constant is that foible of human nature which is capable of all manner of paper heroics in law-making, provided men are not required to live by laws which are passed for women and clergymen.

In gracefully abandoning its projected naval station and frowning fortresses at Wei-Hai-Wei, Lord Salisbury's Government gives fresh point to the gibe of a witty critic, that his Ministry has been one of "coma tempered by fits." It was in one of the fits that Wei-Hai-Wei was seized. Germany had snapped up Kiao-Chau, Russia had suddenly announced Port Arthur to be hers, and the British Jingo began to rage. It was necessary that the Government be very prompt and vigorous, and accordingly Mr. Balfour informed the Commons that England was also swooping upon the Chinese carcass, and had got Wei-Hai-Wei. The Chauvinist press was in raptures, and the naval experts were delirious with joy. You see: there England was, firmly planted between the rapacious German and the grasping Russian, and ready to show them that she could beat them at their own game of grab. But time has brought its sobering. The second thoughts of the naval experts were against fortifying; it was seen that Britain had nothing to do in that far northern galley; and now the march down the hill has begun. England found that she had acquired, in Lord Rosebery's ironic phrase, "merely a second-class watering place." At least, she knew enough to retreat from a demonstrated folly. We shall yet learn how to do the same thing; but oh the cost of delay in learning, and the pity and the shame of it!

THE ANGLO-JAPANESE ALLIANCE.

It is not strange that the Anglo-Japanese treaty is received with great enthusiasm in Japan. Apart from any immediate advantage which that country may gain by it, the English alliance is a recognition of her rise to a place among the civilized Powers which can only be flattering to her pride. Fifty years ago, Japan was, to all Western nations, simply one of the outlying hordes of barbarians. Until within ten years she was still under treaty obligation to allow foreigners on Japanese soil to be tried by their own extra-territorial courts—so deep was the distrust of native methods. Now, at one bound, Japan comes forward as a nation with which Great Britain is glad to treat on equal terms. It is a vivid reminder of the folly of arrogance of race. Who knows that the despised Filipinos, if given a chance by the removal of foreign pressure, might not make as rapid progress in the next half-century as Japan has made in the past? We ought never to forget the pit whence we ourselves were digged. Go back far enough, and we find our ancestors the inferior race looked upon with contempt by the then leaders of civilization. William Pitt exclaimed in the House of Commons, when a bill to repress the slave trade was up: "We Britons were once as obscure among the nations of the earth, as savage in our manners, as debased in our morals, as degraded in our understandings, as these unhappy Africans are at present."

The drift and tendency of events, long ago foreseen, furnishes a sufficient explanation of the Anglo-Japanese alliance. "Every port, every town, every village that passes into French or Russian hands," says Mr. Curzon, in his 'Problems of the Far East,' "is an outlet lost to Manchester, Bradford, or Bombay." Can England, or England and Japan, or those countries and the United States, stop the progress of Russia in Mantchuria, or in any other part of North China? Probably not; but they may retard it sufficiently to give China an opportunity to become civilized and to help herself to resist the aggression of her northern neighbor. Russia is not yet ready to swallow her prey, and it may be possible for England and Japan to make conditions which shall secure to other nations all the trading rights that they now enjoy. In any such endeavor the United States is a deeply interested party. Accordingly, Secretary Hay has rightly protested against the conclusion of a secret arrangement between the Chinese Government and a Russian banking company, giving to the latter exclusive mining concessions in Mantchuria. Such exclusive concessions would be in conflict with rights secured to us by the treaty with China, dated June 18, 1858, which secures to the citizens of the United States equal privileges with those of any other nation in respect of navigation, commerce, political or other intercourse. An exclusive privilege of mining granted to Russian subjects would be in conflict with the spirit, if not the letter, of this clause. So, too, would be the exclusive privilege of landing telegraph cables on the coast of China for thirty years, which was granted to a Danish company a few years ago, and which has since been acquired by an English company, and approved by Parliament on the 6th of June last, and which effectually prevents the American Pacific Cable Company from reaching the Chinese coast.

Technically, the treaty provides for a coalition only against a coalition. Neither Great Britain nor Japan would be entitled to call upon its ally for aid if either became engaged in a war, for example, against Russia alone. It is only when some "other Power or Powers should join in hostilities" that "the other contracting party will . . . conduct war in common and make peace in mutual agreement." But, as things stand, this practically covers all the chances of war in the Orient, and binds England and Japan to maintain "the *status quo* and general peace." Needless to say, there stands behind the agreement the power to make it respected. The English and Japanese fleets united would absolutely command the China Sea; and Japan could, at present, more quickly fling an efficient army into Korea than could Russia. With the United States neutral, as it would be bound to be in any contest in that part of the world, the union of Japanese and English forces, on land and sea, would obviously be strong enough to enforce their common will.

It cannot be denied that the publication of the treaty is tantamount to serving notice upon Russia that what Baron de Staël at the Hague Conference called her "lurking hopes" (*espérances ultérieures*) in the Orient must, for a long time to come, be held in abeyance. There will be no insinuating Russification of Korea. That country was recognized as independent by both China and Japan in the Treaty of Shimonoseki, as it was later by the Nissi-Rosen protocol between Japan and Russia signed in April, 1898; yet by both the latter Powers it has been almost openly treated as a prize to be striven for. Russia wants Korea, not simply because it is territory to be seized and developed, but also because it stands like a wedge between her two Pacific ports, Vladivostok and Port Arthur. Japan looks eagerly over the Korean gulf to that old "land to the westward" which she conquered more than 2,000 years ago, which has since, though lost to her, sustained the most intimate relations with her—in religion, in art, in commerce—and which to-day stands before Japanese imagination and ambition as the one rich and sparsely settled country into which the overflowing millions of crowded Japan may press. There was thus undoubtedly a bad quarter of an hour in St. Petersburg when the news arrived that England had thrown her sword on the Japanese side of the trembling Korean scales.

Yet the Russians may be excused for sardonically smiling at this new guarantee of the "territorial integrity of China and Korea." Their diplomats have not forgotten the European guarantee of the integrity of the Turkish Empire. In spite of that, province after province and principality after principality have been shorn from the Sultan, mainly by the Russian shears. England stands officially, as Lord Cranborne declared the other day, for "the *status quo* and the integrity of Persia"; yet Russia is steadily annexing it commercially from the north, while Germany is eating into it from the west. "It is all very well," Russians may say, "for those who do not want territory to talk about leaving it in its integrity. We want it. We are taking it and occupying it every day, and mean to keep right on." So they undoubtedly will. They will politely agree to any international understanding which they are forced to accept, but in their steady push into North China, as travellers, colonizers, merchants, they will not be deterred for a day. They have the inside lines. Theirs is the advantage of proximity, of adaptability to native ways, and of sleepless energy. Nothing but a crash in Russian finance (which is always possible) can prevent the speedy absorption of Mantchuria and as much else of Chinese territory bordering on her Siberian possessions as Russia cares to occupy. There still remains a great measure of truth in Napoleon's remark to Gorgaud at St. Helena: "Russia is the Power that marches the most surely, and with the greatest strides, towards universal dominion."

There is a powerful Russophile element in England, led in the press by the *Spectator*, which has long advocated a Russian alliance, and which will see in the friction that Russian diplomacy may easily provoke at different points a proof that Lord Salisbury has once more laid his money on the "wrong horse." From the American point of view, however, he seems to have made a great stroke. The United States is not and cannot be a party to the Anglo-Japanese treaty, but we are vitally interested in it, and stand to gain much by it. It tends to insure peace in the Orient, and our advantage there and everywhere lies in peace. Further than that, the treaty is expressly designed to secure "equal opportunities in those countries for the commerce and industry of all nations." This is a specific pledge of the open door, though none would have been necessary in a treaty to which England set her signature. She is for a fair field and no favors in matters of trade, and that is our

avowed policy in the Orient, as it should be everywhere. There can be no doubt, therefore, that the United States should hail the alliance between Great Britain and Japan as an auspicious event, and should give it the heartiest approval and moral support.

THE PREVENTABLE WAR WITH SPAIN.

Just as Uncle Sam was most chucklingly complacent over the recent diplomatic blabbing in competition, apparently, for American friendship, he was subjected to a cold douche. In the note of the Ambassadors at Washington, given out by Germany, it appeared that they all agreed that the Spanish concessions had "removed all legitimate cause for war." Then unpleasant intimations began to be heard that the President had not informed Congress of the full extent of those concessions. The European press fell to speaking of our not having clean hands when we went to war, and odious comparisons were made between Mr. McKinley's treatment of Gen. Woodford's dispatch and that of the Ems telegram by Bismarck. Thus we are curiously brought back to the important historical inquiry, Did the President have in his hands in April of 1898 a basis for the relief of Cuba and peace with Spain—a basis which a resolute Executive could have used in a way to avert war?

The only answer we propose to give is drawn from the official documents. We put aside the private accounts that have reached us of the way in which the President allowed himself to be overridden by Congressmen. Looking first to the President's own message to Congress of April 11, we find him describing his final demands on Spain as follows: (1) "the immediate revocation of the order of reconcentration"; (2) "an armistice until October 1." The message went on to say that the reply of the Spanish Cabinet was received on March 31, and that it agreed to an armistice only as prepared by the Cuban Parliament, which was not to meet till May 4. This the President called a "disappointing reception" of his "last overture in the direction of immediate peace," and said that with it "the Executive is brought to the end of his effort."

Now, we ask, what was lacking in the statements of this part of the President's message? In the first place, any intimation that Spain had agreed to his demand for the abolition of reconcentration. Yet there it lies in the very dispatch of March 31 to which he refers, but which he did not publish. "The reconcentrados order has been entirely abrogated in the western provinces," wrote the Spanish Minister, and Gen. Woodford telegraphed the same day to the same effect, adding that Gen. Blanco had been given a special credit of 3,000,000 pesetas to help the people back to their farms. All this the President withheld from Congress. So he did also the definite offer of the Queen Regent, reported by Gen. Woodford on April 5, to proclaim an "immediate and unconditional suspension of hostilities in the island of Cuba . . . for the space of six months, to the 5th of October, 1898." Further on in the message, the President referred to the later Spanish note of April 10, with its offer of an armistice, though he said of this armistice that its "duration and details have not yet been communicated to me." They had been, however, in the Woodford dispatch of April 5. Of that he left Congress wholly in ignorance. It was, in fact, jealously guarded in the State Department for more than three years.

All through those later dispatches the President showed a strange disinclination to alter his message to make it square with the new facts. When that moving and pious message of the Queen's was telegraphed him, he replied at once that he highly "appreciated" her "desire for peace," but that his "message will go to Congress to-morrow." The only reason that it did not go was to give Consul Lee time to leave Havana. Not even then was there any hint that the message would be modified to fit the changed situation. Even the Spanish note of April 10 the President tucked away in a cold reference at the very end of his message. That note, he said, had been received "since the preparation of the foregoing message." It ought really to have made him throw away his message and write a new one. But he was so enamoured of it that he could not bear to change a word; and therefore laid it before Congress, with its unmistakable leaning towards war, although he had just received a communication from Spain which, in the opinion of all the foreign Ministers in Washington, "removed all legitimate cause for war." Again we put aside all unofficial stories about the way in which Mr. McKinley came to do this. The official account is given in a dispatch from Mr. Day to Gen. Woodford of March 30, 1898. In that we read that there was "profound feeling in Congress," and that it was held in check "only by assurance from the President that . . . he will submit all the facts to Congress at a very early day"—that is, let the war party have its head.

Some people get angry when told that President McKinley, at that crisis, "abdicated." But he himself admitted it. In his answer, through Mr. Day, to Gen. Woodford's urgent appeal, he said, "The President cannot assume to influence the action of the American Congress." But who said that? Why, the man who had in his own hands the entire negotiation. It was his sworn duty, his solemn obligation, to conduct the affair alone, and to report to Congress, if he could, a completed solution of the grave international problem. Yet instead of seizing eagerly upon the great concession by Spain, and using it to build up an honorable peace, he turned politely away with the remark that he could not think of undertaking to influence Congress! There was the unmistakable surrender of the powers and duties of a great office. What we assert is that a determined Executive, at once accepting and publishing Gen. Woodford's dispatch, hailing it, as he well might, as a great triumph for American diplomacy, and throwing his superseded message into the waste-basket, where it belonged, could have rallied such a peace party throughout the country that a Congress mad for war would have been brought to a muttering submission. There was the great opportunity to prevent the war. It was an "inevitable" war only in the sense that the President of the day was one who would inevitably yield to the pressure of hot-headed Congressmen. "In war," said Napoleon, "*men* are nothing, and *a man* is everything." Unluckily, that man was wanting in those critical days of April, 1898.

THE BILL AGAINST ANARCHISTS.

House Bill 10,386, reported from the Judiciary Committee on February 8, and accompanied by a long explanatory report, is entitled "A Bill for the protection of the President of the United States, the suppression of crime against government, and for other purposes." It is really the residuum of all the bills introduced into the House by excited members since President McKinley's assassination, and represents all that the Judiciary Committee thinks can be done in the way of legal punishment of anarchistic crimes and the suppression of anarchistic doctrines. Some clauses of the bill, as we shall show, are foolish because they are incapable of enforcement; but, on the whole, it is a reasonable and conservative measure, which, after due debate and suitable amendment, might well become the law of the land.

In no respect did the Committee more clearly display its wisdom than in brushing aside the wild proposals which, in the first flurry of grief and indignation last September, were made by apparently sober people, and some of which were embodied in bills introduced in Congress. All criticism of the President, it will be remembered, was to be treated as criminal. Anarchists were to be "strung up" on sight, or else deported to one of Senator Hoar's unnamed islands. All good citizens were, in short, to put down lawless folk lawlessly. But the bill and report of the Judiciary Committee coolly throw all this out of the window. "We have studiously," says Chairman Ray, "avoided interference with the freedom of speech

and of the press." "We have rejected," he observes later, "all propositions looking to the deportation of aliens who have been permitted to land in our country." And he adds the salutary general caution: "We are treading on unknown and untried ground, and it is wise to keep within Constitutional limits." All this is well and soundly put. It is naturally a pleasure to us to see the Judiciary Committee supporting in this way the position which we took in that mad week in September when the passion for "putting down" anarchy by anarchical methods seized upon, and carried away, so many ordinarily sensible newspapers and public leaders and clergymen.

The chief aim of the bill is to establish immediate Federal jurisdiction over criminal assaults upon the President of the United States, or any officer "entitled by law to succeed to the Presidency." One section extends such jurisdiction to the case also of an "Ambassador or Minister of a foreign state," killed while in this country. This is by way of abundant precaution, but seems a proper step towards safeguarding and making more dignified the attitude of this Government towards others. If it could be followed up by a statute giving Federal courts jurisdiction in case of any alien murdered in this country, we should think it a great advance. But that, we suppose, is at present impossible. The bill is guarded in its definition of the crimes it would punish. The assault or murder must be committed while the Federal officer is "in the performance of his official duties, or because of his official character." Private griefs and private vengeance are excluded. Section 8 uses the phrase "unlawful killing," which the report explains as intended to rule out killing under great provocation, or in self-defence, or in any way that would constitute a legal justification. Finally, as Chairman Ray points out, the enactment of the proposed statute would not prevent a State from punishing the offence of killing or assaulting the President or any one in the line of succession. The aim is to arm the general Government with a weapon which it may use in case of inaction by any State.

All these parts of the bill appear to be in line with judicial precedent and the canons of good legislation. No cruel or unusual punishments are provided. The section which would make a "principal offender" of "any person who aids, abets, incites, or conspires with another" to commit the offences named in the bill, does not, we believe, depart from the existing law of conspiracy. There is little ground for criticism, in fact, until we come to those sections intended, not to repress and punish crime, but to repress and punish anarchism. Here the bill stumbles, as does every man who undertakes to legislate against a state of mind. It is one thing to draft a law for fining or imprisoning "any person who advocates, advises, or teaches the duty, necessity, or propriety of the unlawful killing or assaulting of one or more of the officers of the Government," but quite another to devise a criminal statute against any man "who disbelieves in or who is opposed to all organized government."

Under the bill, no man holding those abstract views shall be permitted to enter the United States, nor, if he is already here, allowed to take out papers as a naturalized citizen. The impossible enforcement of this section is discreetly left to that unhappy man, the Secretary of the Treasury, who is to make the needed "rules and regulations." As the report innocently says, "the details" are left to him. But the details are everything. Any one may express a pious wish that no immigrant of anarchistic principles should be allowed to land. But how to find out if he has those principles? By the very hypothesis, he is a man who will stop at no crime. He would kill every Government official cheerfully, and lay whole cities in ashes without the quiver of an eyelid; yet it is supposed that he will have scruples about lying or perjury! We doubt very much if these unenforceable sections of the bill can survive debate in the House and Senate; and we are confident that, if they do, they will instantly become the deadest of dead letters. It seems a pity to encumber with such rubbish a bill which, in the main, is so commendable.

POSTER REGULATION.

It has long been recognized that a certain kind of vulgar advertising is a positive disfigurement of city-street or rural landscape; and various sporadic efforts, chiefly on the ground of good taste, have been made to remedy the evil. A decision of the Appellate Division of the Supreme Court of New York has established the principle that a city —Buffalo in the test case—may by ordinance limit the size of posted advertisements. This was virtually to declare that a certain kind of advertising is so great an offence to the eye as to constitute a public nuisance, and, being such, falls as properly under restrictive laws as reeking chimneys or malodorous factories. It was probably this decision that heartened the American Scenic and Historic Preservation Society to prepare the admirable bill now before the State Legislature.

Assemblyman Landon's bill follows conservatively the approved lines of French and Belgian legislation on this subject. It imposes upon all posted advertisements, except those displayed where the business advertised is actually conducted and those required by law, a stamp tax of one cent for every two square feet—reckoned by the greatest height and breadth of the printed or pictured surface—of posters displayed in public. In consideration of the payment of this tax, the advertiser receives the additional guarantee of a fine of $5.00 upon any person who destroys or defaces a poster properly stamped. The tax is a very moderate one. The average poster displayed at the stations of the elevated railroad and the publishers' placards at the news-stands would be taxed one or two cents. The larger paintings on the hoardings—pity that this kind of art cannot be honored with a surtax—would pay only from twenty-five cents to a dollar or so. It is to be feared that a colossal codfish-bearer, who reminds passers on the Brooklyn Bridge that New York is primarily a centre of coughs, colds, and consumption, would, under the proposed law, be able to ransom himself at a ludicrously low price for the disfigurement he causes.

In fact, criticism of the Landon bill must be chiefly of its conservatism. In France and Belgium, posters are taxed progressively by size. In France, posters up to 7 inches square are taxed one cent; 7 to 10 inches, two; 10 to 14 inches, three; all larger, four cents. Painted advertisements are taxed at a much higher rate, on a sliding scale, according to the population of the city in which they are displayed. In a general way the French taxes are from three to four times those proposed in the Landon bill. In Belgium the minimum rate is practically that which is to be tried in New York, but every increase in area beyond the statutory 196 square inches (14 inches square) is so heavily taxed that very large posters are practically prohibited. When the new law—for we must assume that so admirable a measure will meet no serious opposition in the Legislature—has been tried for a year or two, it will be easy to make amendments, possibly such as should discriminate against the larger, and certainly more unsightly, class of painted advertisements. The important thing is to establish the principle that posters may and should be taxed.

Besides the Supreme Court decision already cited, there are numerous arguments for this innovation. Unquestionably the massing of large and hideous advertisements is something more than a sentimental offence. If the wall of Central Park could be lined with hoardings like the approaches to New York through the Newark meadows, the effect in diminishing the residential desirability, and consequently the price, of real estate would be quickly felt. Similarly, if less markedly, to deface a beautiful countryside by the appeals of pill-men and pad-men, distinctly lowers its standing, not only from the æsthete's point of view, but also from the real-estate agent's. It need not be urged that the multiplication of advertising boards which obscure the street sign,

partially at our elevated stations and completely at those of the London underground, is a nuisance of the most palpable kind. In this connection the petition of Mr. Maltbie, Chairman of the Committee on Advertising Signs of the Municipal Art Society, deserves attention. He asks Comptroller Grout that no advertising signs shall be allowed in the proposed subway to Brooklyn, and he cites the example of various English cities which, upon assuming control of the street railways, have, as a matter of municipal pride and expediency, entirely abolished all posters in the cars and stations. It is hardly necessary to argue further the proposition that he who offends the eye grievously is quite as amenable to restriction as he who offends the ear or the nose.

We should not, however, look upon ourselves as sinners above other men in this matter. We have not yet produced any advertising mechanism so monstrously absurd as the average London 'bus; and if the English have preceded us in this reform, it was because their need was greater. It should not be for a moment imagined, either, that the Landon bill is drawn in a spirit of hostility to legitimate advertising. The advertisers can but gain by withdrawing from the scramble and studying effective means of attracting the passing throng. The shrewdest advertisers have long ago perceived that an attractive design and legend in the right place is worth many blatant hoardings in any place. The great multiplication of ugly pictorial signs, in fact, probably represents rather the enthusiasm of the advertising agencies than the sober judgment of the individual advertiser. It is because the Landon bill is so much in the interest of all concerned that we confidently urge its enactment into law.

ROYALTY AT THE NEW GALLERY.

LONDON, January 15, 1902.

The present royal family in England have shown themselves so indifferent to art, or rather so ready to prefer the vulgar and the tawdry to the good, that one is apt to forget what distinguished patrons of art British Kings and Queens have been in the past. The name of Holbein adds greater glory to the House of Tudor. The Stuarts would be half forgotten but for Van Dyck, and, in a lesser degree, Lely and Kneller. Even the Georges had the intelligence to recognize—though dimly—the distinction they could borrow from the great painters of their day, from Reynolds and Gainsborough, Romney, Hoppner, and Lawrence. It was really not until the Victorian era that the second-rate and the mediocre came into fashion at court. There was, therefore, every reason to look forward to a fine and important collection of portraits when the New Gallery announced the "Monarchs of Great Britain and Ireland" as the subject of its winter exhibition.

But, unfortunately, the managers of the exhibition seem to have been seized with unnecessary scruples. Within the last decade there have been Tudor and Stuart and Guelph shows at the New Gallery, where many fine portraits were hung. These portraits, apparently, the managers have hesitated to hang again lest they risk the charge of repetition. A good thing, however, cannot be seen too often; indifferent work is not worth seeing once; and by far the greater number of portraits in the present collection are of indifferent merit.

Historically, the series is wonderfully complete, and for the student of history the interest is great. From Edward III. down to Edward VII., there is not a break, not a gap, in the royal succession. There is even a record of so remote an event as the marriage of St. Ethelreda to Egfrid, King of Northumberland, though, to be sure, the record itself dates no farther back than the fifteenth century. It was the misfortune of the earlier kings that none but the Primitive was then alive to paint them. Sometimes, if not always, the Primitive came from abroad. Lucas Cornelisz and Jan de Mabuse are names with which some of the first pictures are labelled. But while the Primitive might give an amusing chronicle of amusing costume, a decorative design in which the heraldic device in one corner and the lettering in another are as important as the face and figure of the sitter, he could not make the men and women he painted live for you, he could not make them stand upon their legs, real human beings of flesh and blood. In all the portraits before Holbein, and in many after, the kings and queens seem mere symbols of royalty, though often the symbol suggests what you cannot help feeling to be an accurate likeness. The three or four portraits of Henry V. bear a striking resemblance one to another; in each the same serious, thoughtful face, only the full red lips reminding you that this stern, ascetic monarch was once the boon companion of Falstaff, the hero of revels at the Boar in Eastcheap. The heavy cheeks, little bead-like eyes, and thin lips are the same in every portrait of Henry VIII.; but then, by this time Holbein had come to England and given lesser painters a model. There are several portraits of Henry and Edward VI. and other members of the same royal family attributed to Holbein; but I believe it is generally admitted that few paintings of the kind in England are really by him, and I know that none at the New Gallery could, with credit to the German master, be claimed for him. On the other hand, there is the large cartoon lent by the Duke of Devonshire, drawn by Holbein for the fresco at Whitehall that was long since destroyed by fire; a splendid piece of drawing. In the foreground of a stately architectural design, the life-size, full-length figure of Henry VIII. swaggers, large, massive, the legs well apart in the familiar pose; the costume is the one that has been copied again and again, until we know it as well as the coat and trousers of to-day; the gross, sensual face is as real to us as the unforgettable features of Velasquez's Philip or Van Dyck's Charles. Henry VII., on a higher step, stands modestly in the background. A copy was made of the fresco for Charles II. by a Flemish painter, Remigius van Leemput, and may now be seen at Hampton Court, offering a suggestive comparison with the cartoon. There are also three or four Holbein drawings of Edward VI. and Jane Seymour, characteristic outline drawings, touched here and there with color. But one remembers regretfully the fine series at the Tudor Exhibition.

After the Holbeins, little will detain the artist until he comes to the Van Dycks. For the historian, I admit there is much to note by the way: the forbidding portraits of Mary Tudor—the face so cruel, hard, and fanatical you are ready to believe any evil of her, and neither Sir Antonio More nor Lucas de Heere made an effort to soften it, whatever pleasure they took in her rich brocaded and jewelled robes; the extraordinary portraits of Elizabeth, her incredible gown embroidered with birds and beasts and fishes, a museum of natural history, as you see it in the large canvas (by an unknown painter) lent by the Duke of Devonshire, whereas in the three portraits by Zucchero the ruff, with its wide gauze wings, the balloon sleeves, with tulips springing from them in one version, the necklace, the ostrich-feather fan, are all woven into an ingenious decoration in which the face almost disappears; the disappointing portraits of Mary Stuart, that cannot explain her charm, but that no doubt will revive old controversies—among them, one of the "memorial portraits" painted long after her death, a full-length with the scene of her execution realistically recorded in the background, and, far more interesting, a small panel by Janet of the Queen in the famous *deuil blanc* for Francis. I suppose even the portraits of James I., by Jameson, and his Queen, by Van Somer, will attract the historian, but they have left a blank in my memory. Or, perhaps, I have forgotten them because of my more acute disappointment when I got so far in this rapid historical review as the Stuart who, of all the British sovereigns, cared most for art and worked most intelligently for its encouragement. Charles I., whatever his weaknesses, whatever his crimes toward his people if you will, was great in his love for art. His pride was his collection of pictures, to which the nation still owes many of its treasures. His delight was in being painted by the masters of his time. He was as royal in his patronage of Van Dyck as Philip IV. was in the honor paid to Velasquez. And Van Dyck returned the royal favor by making the King, the Queen, and the little princes and princesses the motives for his most splendid masterpieces. What he could do for the House of Stuart was shown in the Van Dyck Exhibition at Antwerp, and even more strikingly when that exhibition was transferred to the Royal Academy, with many notable additions.

But the New Gallery, whether fearing to find the public fickle, or whether failing to induce owners to part so soon again with pictures on tour but a year or two ago, has not included one of the portraits that were the glory of those two memorable collections. Of the six that bear Van Dyck's name, none but the Queen Henrietta Maria lent by Mr. Edmund Davis stands out with anything like the distinction expected of Van Dyck at his best. This, however, is very charming, though with a touch of insipidity or over-prettiness that makes one question how it would have stood the test of being seen at Antwerp or the Royal Academy. It is a half-length. The Queen, in her fa-

vorite white, stands, resting her right hand on a crown set upon a table at her side. A curtain is drawn up and loosely draped behind her. It is the conventional setting of the fashionable portrait of Van Dyck's day; but there is grace and dignity in the pose of the Queen, beauty in the soft warm red of the curtain (the color repeated in a higher key by the ribbons on her bodice), and refinement in the painting of the jewels about her neck and wrists. The portrait, in its richness of tone and its perfect pictorial unity, has just "the little more" that separates it for ever from the barren, matter-of-fact record of the painter who, before photography was invented, made of himself a human camera.

Certainly nothing in the Gallery can approach it until the later Hanoverian period, when one most lovely Gainsborough is reached. But you must first pass a flamboyant series of Lelys and Knellers — Charles II.'s sensual, cynical face, and James's rather characterless features, almost as overshadowed by the decorative glory of flaming wig and gorgeous silks as Queen Elizabeth's by elaborate detail of ruff and embroidered gown, while neither of the fashionable portrait-painters is as well represented as he might be. You must first wade through a dreary succession of big full-lengths, formal and empty, painted mostly by Van der Vaart and Jervas, of the early Hanoverians. But then, at last, you have your reward in Gainsborough, to whom both George III., though Benjamin West was his favorite painter, and Queen Charlotte condescended to sit. It is plain, however, that he found the burden of such commonplace royalties all too heavy. The portraits are full-lengths, the King and Queen standing each before the conventional background of architecture and landscape then in vogue, and Gainsborough managed to give to "Farmer George" and "good old ugly Queen Charlotte" something of the regal dignity that probably never was discerned in them save by the eye of genius, even if he could not pretend the enthusiasm he did not feel. To him also came the Duke of Gloucester and his Duchess, the famous Maria Walpole, the beautiful niece who figures so largely in Horace Walpole's Letters. But Duke and Duchess also failed to inspire him, and these four portraits are interesting chiefly because of the history and gossip with which they are associated. It is another matter, however, with his "Anne Luttrell, Mrs. Horton, Duchess of Cumberland," whom we should think enchanting were there no title or tradition to identify her. The portrait is a half-length, very much smaller than the other canvases, and now hanging modestly in a corner. The composition is simplicity itself. The conventional background is omitted. But the beautiful head with the elaborate coiffure, the pale rose-red gown, with the delicate fichu and embroidered scarf, were to Gainsborough motives for one of the loveliest harmonies he ever created.

With the canvases that follow, interest dwindles, the names of Romney, Hoppner, and Lawrence scarcely reviving it, until it disappears utterly in the performances of the Victorian Era. Queen Victoria may have had excellent political advisers, but in art she was allowed to wander hopelessly astray. When the choice of a painter fell to her, she seemed instinctively to prefer the least distinguished. When an artist of note chanced to be commissioned by some one else to paint the royal portrait, he seldom could withstand the deadening, vulgarizing influence of the Victorian court. One or two unimportant records of important events in the early part of the reign, and a sketch by Hayter, mark the beginning of the period. The end is commemorated in that huge stretch of canvas, "Four Generations," by Mr. Orchardson, the Royal Academician, which was exhibited in the Academy of 1899. I described it at the time—the big, ugly, stiff royal apartment, really a corridor at Windsor Castle, with the ugly detail beautifully rendered, and with the royal group, Queen Victoria, the then Prince of Wales and Duke of York, and the little Prince Edward of York, as wooden and lifeless and mechanically posed as if they were so many lay figures or tailor's dummies arranged for a fashion-plate. Mr. Orchardson is an artist of distinction, but, for the moment, royalty paralyzed him. The collection ends with a full-length of the King by Mr. Stuart-Wortley, which is commonplaceness itself, and a little panel by Bastien-Lepage, dating many years further back, almost as commonplace, though technically infinitely better. The head is finished with the minuteness of a miniature, but it is so characterless, so smooth and smirking, so idealized, I can hardly believe it to be the portrait, or even the study for that portrait, which rumor declared the King, as Prince of Wales, rejected because of its uncompromising realism.

Scattered through the galleries are two or three cases of miniatures in which royalty makes a more decorative display. There are good examples of Holbein, Janet, Hilliard, Oliver, Petitot, Cosway, from various collections; little gems, many of them, by masters who understood an art that has been sadly dishonored by its recent fashionable revival. The old miniature-painters knew how to place a head, or a figure, on their little square or oval of ivory or paper, so as to make a fine design; they knew how to give it the beauty of color, they knew how to draw within the limits at their disposal without any sacrifice of character. I can only hope the good result of showing such an admirable series will be felt in the two annual exhibitions of miniatures now held in London, where the touched-up photograph seems to be the standard accepted.

These historical exhibitions are never complete without a liberal supply of "relics," and relics now appear in the usual variety and number. They are the things that appeal most keenly to the large majority. As a grave Scotchman, at the Press view, assured me, there is a never-failing pleasure in dropping a sentimental tear on the shirt of Charles I. or a lock of his hair. The New Gallery offers an unrivalled opportunity for the admirers not only of the Stuarts, but of the Plantagenets, Tudors, and Guelphs. Many and various are the objects in this section, from the baby linen made by Queen Elizabeth, while still a princess, for the child Queen Mary never bore—tragic little caps and shirts—to the gorgeous gold-embroidered robes which George IV., the first gentleman of Europe, wore at his coronation; from the jewels of the Stuarts to the rich official plate of the Hanoverians; from the signet ring of King John to the pens used by Queen Victoria at her coronation and wedding. It would be impossible to describe all these things in detail. Some come from South Kensington, others from royal and private collections, and many an afternoon could be spent amusingly, even profitably, wandering from one case to another of the several that contain them. The Society of Antiquaries have contributed an interesting series of the royal seals of England, and Messrs. Lincoln & Son a collection of gold and silver coins, extending from Norman days to our own. It is impossible to look at them without regretting that the designer of the new coins just issued, bearing the head of King Edward VII., did not rely less upon his own poor powers of invention and more upon a careful study of earlier artists. Of armor just enough is shown to decorate the large square central hall, lending to it quite the air of an apartment of state in some fine old castle or noble mansion. Of royal letters and manuscripts there are more than I can do justice to at the end of an article.

N. N.

THE MOTHER OF THREE KINGS.

PARIS, February 1, 1902.

M. Stryienski edited, a few years ago, the very interesting memoirs of the Countess Potocka. He now publishes a book which contains not so much original matter, but which is, nevertheless, valuable, since, according to the rules of the new historical school, there are to be found in it some inedited documents. The title of it is 'The Mother of the Three Last Bourbons, Marie-Josèphe de Saxe, and the Court of Louis XV.'; but it should have been: 'The Mother of the Three Last Bourbon *Kings*.'

The son of Louis XV. had two wives. It is well known that he was passionately fond of the first, the Infanta of Spain. María Terésa Raphaëlli, daughter of Philip V. and of Elizabeth Farnese, arrived from Spain in 1745, and died eighteen months afterwards in giving birth to a princess who likewise died. María Terésa had pleased nobody at the French court, except her husband, who was also only seventeen years old. He became immediately very fond of her, and twenty years afterwards, in his will, written *in articulo mortis*, he asked that his heart should be placed at St. Denis near the heart of the Infanta. The Court of Madrid and a great party at Versailles desired that the Dauphin should marry at once Antonia, the sister of María Terésa. But at that time there was still a great repugnance to unions between brothers-in-law and sisters-in-law (these marriages continued forbidden in France in the Code Napoléon, and became legal only after the Restoration). As France was at the time at war with Austria, the Princess chosen was a daughter of the Elector of Saxony, who was on the throne of Poland. Marie-Josèphe de Saxe was only fifteen years old. M. Stryienski gives us, with the most minute details, the story of the negotiations which preceded the marriage, of all the ceremonies, of the Court functions, and of the popular rejoicings which accompanied this event. The marriage was celebrated on the 9th of February, six months after the death of the first Dauphiness.

The principal negotiator in the affair of the Saxon marriage was the conqueror of Fontenoy, the famous marshal Maurice de

Saxe, who, by his victories, had obtained great credit at the Court of Versailles. His letters are more amusing than are mere diplomatic documents. For instance, he is describing the French Court to the mother of the young Princess:

"To succeed here," says he, "there must be no superciliousness nor familiarity. . . . The women of the Court all have *esprit* like devils and are correspondingly wicked. They will never be wanting in respect to her [the future Dauphiness], but they will try to involve her in the quarrels which they have perpetually among themselves, and this is far from laughable or amusing. The King does the same. If anything displease her, let her address herself directly to the King. . . . He is the only person in the Court with whom she must have no reserve. She must look upon him as her asylum, her father, and tell him everything, good or bad, as it comes, without any disguise. With all the rest, I recommend reserve. If she practises that, he will adore her."

The Queen, he continues, "is a good princess, who often has her little whims, but who has never known what to do to get them humored." As for the Dauphin,

"he has much *esprit*, more than he seems to have. The King likes him much more for his docility, I believe, than for any other reason. I noticed that last year people made an estrangement between father and son [this was on account of Madame de Pompadour, the friend of Maurice de Saxe; he does not name her in his letter, but the Queen of Poland probably understood the allusion]. The King did not cease to make advances to the Dauphin till he won him back to him. They now get on well together and it is necessary, for the good of the state and the good of everything, that the Princess should always keep this point in view, and that she should work incessantly to preserve the union between father and son. She will thus obtain the confidence of both and the respect of all."

The Dauphin was attached to the memory of his first wife. He had made a sacrifice to reasons of state in remarrying. M. Stryienski pretends that he was not always faithful to his second wife, and that she had on various occasions a right to complain of him. On this point we find him opposed to the tradition which represents the son of Louis XV. as a prince of almost austere virtue. The intimacy became, however, complete after a great malady of the Dauphin's, during which his wife took the greatest care of him. The Dauphiness had her first son in 1751, and then four others in rapid succession. The names given to these children were the following: Dukes of Burgundy, of Aquitaine, of Berry, Counts of Provence and of Artois. The Duc de Berry became Louis XVI., the Comte de Provence Louis XVIII., the Comte d'Artois Charles X. Then came two princesses, the second of whom was the unfortunate Madame Elisabeth. Marie-Josèphe was entirely engrossed in her maternal cares, and took no part in politics. Her position had been from the beginning very difficult between her husband, the King, the King's sisters, and the favorite, Madame de Pompadour. She always maintained a great attachment for her own country, and took much interest in the incidents of the Seven Years' War. She hoped for a moment that Saxony would receive an increase of territory, but her hopes were disappointed. The humiliations of Saxony during the Seven Years' War were a great blow to her pride and her affections, as they deeply affected her father and her mother, whom she had never seen since she came to France, and who both died without having the consolation of saying good-bye to her.

She had other troubles and losses very close to her. The eldest of her daughters died very young, as well as her second son, the Duc d'Aquitaine. She lost the Duc de Bourgogne later, when the child was already ten years old. This child seems to have resembled in many respects the pupil of Fénelon who bore also the name of the Duc de Bourgogne; he was naturally very violent and irascible, but gradually became mild and amenable. He was extremely pious, but even when he received religious lessons of humility, he did not forget who he was. When the story of Esau was told him, he was already ill and in bed; he protested that he would never sell his birthright for a mess of pottage, not even for a return to health. The Dauphin himself fell ill during some military manœuvres at Compiègne, and became consumptive. He had grown very much attached to his wife, for their common sorrows had brought them nearer to each other. They lived together with great simplicity. He called her Pepa; when he felt himself dying, he insisted upon her staying near him, contrary to the rules of royal etiquette.

After his untimely death, Marie-Josèphe wrote to a bishop who was her friend: "I don't know any more what it is to be happy. I come and go, I speak, I even laugh at times, but sorrow never goes out of my heart; all that might give pleasure gives me pain, for it reminds me of my misfortune. All the pleasure I have is to weep over what I have lost, and to speak of him with those who really loved him." She now occupied herself exclusively with the education of her children. When the Duc de Berry was of marriageable age, she was not consulted in the choice of a wife. The King announced to her that, for political reasons, he was inclined to choose an Austrian princess. She merely said that the late Dauphin had other views for his son; she added that the best way to keep the Court of Vienna in a proper state of feeling was to keep it between fear and hope. After some time, however, the marriage with Marie Antoinette was decided on; this marriage was the work of the Duc de Choiseul.

Marie-Josèphe fell ill, and for some time was treated by the famous Genevese doctor, Tronchin. It was of no avail; she died, on the 13th of March, 1767, and was buried next to her husband. Her life had not been a very happy one; what would her thoughts have been if she had been able to prophesy the dramatic, we may say the tragic, destiny of her three sons, who were all fated to wear the French crown? Victor Hugo, in his "Voix Intérieures," speaks of the early days of these three princes, and of Marie-Josèphe, their mother. Alluding to the future, he says:

"Dieu! comme avec terreur leur mère épouvantée
Les eût contre son cœur pressés, pâle et sans voix,
Si quelque vision, troublant ces jours de fêtes,
Eût jeté tout à coup sur ces fragiles têtes
Ce cri terrible: 'Enfants, vous serez rois tout trois'!

. . . . . .

De vous trois enfans, sur qui pèse
L'antique masure française,
Le premier sera Louis Seize,
Le dernier sera Charles X."

And, after an allusion to the scaffold on which fell the head of Louis XVI., speaking of Louis XVIII. and Charles X., he adds:

"Le règne de Louis, roi de quelques bannis,
Commence dans l'exil, celui de Charles y tombe.
L'un n'aura pas de sacre, et l'autre pas de tombe:
A l'un Reims doit manquer, à l'autre Saint-Denis."

Correspondence.

SIR C. FURNESS'S SHIP-BUILDING.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* for December 26, 1901 (p. 484), the statement is made that Sir Christopher Furness "left in American shipyards orders aggregating four million dollars for twelve steamers of an average carrying capacity of eight thousand tons"; and the comment is made that this is an "untimely confirmation of the well-known fact that this is the best place in the world to buy ships."

May I ask whether it is certain that any such order was placed in the United States? My own impression, on reading the item in the daily press, was just the opposite of what you report. I have since been informed, on the authority of *Fairplay:*

"It is reported that Sir Christopher Furness, while in the United States last month, arranged for the building of six oil-tank steamers of about eight thousand tons dead weight each. It is believed that the vessels will be constructed on the North-east Coast."

In this paragraph the reference is, I believe, to the northeast of England, Sir Christopher having a large shipyard at West Hartlepool.

The matter is one of such considerable interest that I should like to be more certain of just what occurred. If it was a sale instead of a purchase, it surely ought not to be used to support the claim that ships can be built more cheaply in the United States than in England.—Yours respectfully, HENRY RAND HATFIELD.

UNIVERSITY OF CHICAGO, February 8, 1902.

[It would appear that we had misread; but we cannot at this moment verify our source.—ED. NATION.]

NEW YORK ANTICIPATED.

TO THE EDITOR OF THE NATION:

SIR: In this week's publication you say: "An admirable feature of our revised charter is the provision which allows the head of any administrative department to occupy a seat in the Board of Aldermen and authorizes him to participate in its discussions." You close the editorial by saying that, so far as you can recall, this is the first time this principle has been applied in this country.

I would call your attention to the fact that, under the new city charter of Baltimore, all heads of departments have seats in the First Branch of the City Council, which is the popular branch, and have the right to participate in discussions. This system, among the many other very excellent provisions of the new city charter, has been in operation here about two years.

Knowing that you wish to be fair in all matters, except as to Southern ques-

tions, I take the trouble to give you this information.—Very respectfully,

CONWAY W. SAMS.

BALTIMORE, February 13, 1902.

[And we take the trouble to thank our correspondent for jogging our memory, though the matter is municipal, and not Southern.—ED. NATION.]

TO THE EDITOR OF THE NATION:

SIR: Referring to the editorial note in your issue of the 13th instant, relative to heads of administrative departments occupying seats in legislative bodies, I beg to call your attention to the fact that the city of Cleveland has had this provision in its charter since the present Federal Plan Law went into effect, some nine or ten years ago.

I believe there has never been any question as to the desirability of this feature of the law. Under this provision the Mayor and his Cabinet, who are the heads of the administrative departments, occupy seats in the City Council without vote.

Respectfully, JOE C. BEARDSLEY.

DEPARTMENT OF PUBLIC WORKS, CLEVELAND, O., February 15, 1902.

CONTEMPORARY GERMAN LITERATURE.

TO THE EDITOR OF THE NATION:

SIR: Those who would like to know more about recent developments in German literature will be glad of the letters which Prof. Charles Harris is sending to the *Nation* from Berlin. Considering our large German population, it is surprising how little is known in this country about German authors of the present day. Paul Heyse, Rosegger, and Spielhagen belong properly to a past generation. Of those who have become distinguished within the past ten or fifteen years it may be doubted whether any names except Hauptmann's and Sudermann's are at all known in this country. Not long ago Mr. Julian Hawthorne had occasion to review the translation of a novel by the well-known German writer, Richard Voss (I think it was called 'Sigurd Eckdahl's Bride'). Evidently he had never heard of Richard Voss, for he took for granted that the story was written by some Scandinavian.

For some reason our literary journals seldom refer to contemporary German literature. In 1900 occurred the death of a German novelist of some note, Ernst Eckstein, but I did not see any reference to it in the New York *Bookman* or the Chicago *Dial*, both of which I was then taking. On the other hand, *Das Litterarische Echo*, a magazine of the same class published semi-monthly in Berlin, has regular letters from both London and New York, from which we may infer that every new American writer of promise is brought to the notice of the German literary public.

Those who would like to see recent German novelists treated from the view-point of Christian morality would do well to procure a fifty-page pamphlet by Ulrich von Hassell entitled 'Streiflichter auf die Unterhaltungs-Litteratur der letzten 20 Jahre.' He divides recent German novelists into three classes: first, "Die Jüngstdeutschen" and "Modernen," who follow Zola, and, in the frantic desire to be realistic, are not governed by any limitations of purity or propriety; second, the distinctly Christian writers, like Emil von Grotthuss and Peter Rosegger. But between the two he puts those whom he calls "independent" and "neutral." Among these an honorable place is given to the subject of Professor Harris's last letter, Georg Freiherr von Ompteda.

HERBERT MORISON CLARKE.

ELDRED, PA., February 13, 1902.

Notes.

Mr. Worthington Chauncey Ford is about to print, in a limited edition for subscribers, the journals of the sessions of the General Court of Massachusetts for May, July, and August, 1715—the year which marked the beginning of a series of printed reports nowhere extant in their entirety. He will follow a copy belonging to Judge Samuel Sewall, the diarist, and will supplement it (in default of any printed original of the November journal—there was none—and of the manuscript, which has been destroyed) with the Minutes of the Governor and Council for that session. These are quite inedited. The volume will, to judge from the prospectus, be elegant and stately, and will be bound in paper boards with cloth back. Mr. Ford's address is No. 11 Prescott Place, Lynn, Mass.

A manuscript work of Martin Luther has been recently discovered in the library of a deceased Russian prince, noted as a scholar and bibliographer, and is now in the possession of his daughter, who prefers to sell it directly to some public or private library, in which it would be permanently preserved. The contents consist of miscellaneous theological treatises, written chiefly in Latin (although a few of the final pages are in German), and not printed in any edition of Luther's writings. The volume has, therefore, not merely an autographic, but also a real literary value. It contains 552 pages of rather heavy paper bound in vellum. On the fly-leaf are the words, "D. Martini Lutheri Autographa Manuscripta Theologia Miscellanea," with the date 2. Aug. Año 1547, and the name Wolfgangus. This would seem to imply that after Luther's death on February 18, 1546, the manuscript became the property of Luther's most enthusiastic friend and supporter, Wolfgang, Prince of Anhalt, who, on account of his zeal in promoting the Reformation, was put under ban and temporarily deprived of his sovereignty by Charles V. The genuineness of the MS. appears to be undisputed. Here is a rare chance for some one to secure it, say, for the Germanic Museum at Harvard.

The latest Clarendon Press publications include editions of 'The Lay of Havelok the Dane,' by W. W. Skeat; 'The Complete Works of John Gower,' volume four, by G. C. Macaulay; 'Plays and Poems of Robert Greene,' by J. Churton Collins; and 'Elizabethan Critical Essays (1570-1603),' by G. Gregory Smith. Also, 'The Troubadours of Dante,' by H. J. Chaytor; 'A Summary Catalogue of Bodleian MSS.,' volumes five and six, by F. Madan; 'British Colonies and Protectorates,' by the late Sir Henry Jenkyns; the 'Life and Correspondence of Thomas Cromwell, Earl of Essex,' by R. B. Merriman; 'The Memoirs of Bishop Burnet,' by Miss H. C. Foxcroft; 'A History of the Peninsular War,' by C. W. C. Oman; the seventh volume of the late J. E. Thorold Rogers's 'History of Agriculture and Prices'; 'An Antiquarian Companion to English History,' by F. P. Barnard; and an authorized translation of Schimper's 'Geography of Plants,' by Percy Groom and W. R. Fisher.

John Lane will shortly publish a second volume of 'Florilegium Latinum,' celebrated passages, mostly from English poets, translated into Latin by the Rev. J. St.-John Thackeray and the Rev. E. D. Stone; and 'India's Love Lyrics,' collected by Lawrence Hope.

Directly to be issued by Macmillan Company is A. R. Colquhoun's 'The Mastery of the Pacific,' profusely illustrated.

The Psychical Research Society's publications are to be made to do duty in establishing the marvels of Revelation in a volume announced by Thomas Whittaker, 'Psychic Research and Gospel Miracles,' from the pens of Thomas G. Allen, M.D., and the Rev. Edward M. Duff.

'The Next Great Awakening,' by Dr. Josiah Strong, which Baker & Taylor Co. have in press, is a prophecy of a new religious revival during the present century. The same firm promises 'Parliamentary Usage for Women's Clubs,' by Mrs. Emma A. Fox.

'Bramble Brae,' the collected poems of Robert Bridges ("Droch"), and 'According to the Season,' talks about the flowers in the order of their appearance in the woods and fields, by Mrs. Frances Theodora Parsons, with drawings by Elsie Louise Shaw, are to be published by Charles Scribner's Sons.

A. Wessels Co. will add to the late Grant Allen's series of "Historical Guides" a volume on 'Umbrian Towns,' by J. W. and A. M. Cruickshank. They are also about to bring out a volume of verse, 'The Nameless Hero,' by James Blythe Anderson.

L. C. Page & Co. have nearly ready 'The Best of Balzac,' edited by Alexander Jessup.

There must be a scramble for the limited edition of a work on Italian bookplates, 'Gli Ex Libris Italiani' (Milan: Ulrico Hoepli; New York: Lemcke & Büchner), a handsome quarto, to judge from the prospectus, with the usual illustrations, under the joint editorship of Achille Bertarelli and David Henry Prior.

The 'Lectures and Essays' of the late William Kingston Clifford were first published in 1879, the year of his untimely death at the age of thirty-three, and were reviewed by us at considerable length on their appearance. There has been an intermediate edition preceding the third (in two handy volumes, "Globe 8vo") now issued by Macmillan. The literary remains, therefore, of this most promising man of genius have maintained a vital currency for nearly as long a term as was vouchsafed him in living. "Conditions of Mental Development," "On Theories of the Physical Forces," "Aims of Scientific Thought," "Atoms," "The Unseen Universe," "Body and Mind," "Right and Wrong," "The Ethics of Belief," "The Ethics of Religion," "Cosmic Emotions"—such are some of the themes considered by Clifford, whose appeal would seem to be to a select class of minds that reason freely about mathematical, philosophical, and general scientific conceptions. And so it is as a whole, but at the same time the author's

popular style will beguile those whom his subjects might daunt, and he can light up a discourse on "Right and Wrong" with an apt illustration from his brother mathematician's 'Through the Looking-Glass' of *Cogito, ergo sum.*

The latest issues of the Bell-Macmillan "Great Masters" series are 'Rembrandt,' by Malcolm Bell, and 'Giotto,' by F. Mason Perkins. The 'Rembrandt' is merely an abridgment of Mr. Bell's previous book on the same subject, published in 1899 and reviewed by us at the time; but Mr. Perkins's work is, in more ways than one, an original contribution to the series. Mr. Perkins has ideas of his own on the chronology of Giotto's work, and sets them forth lucidly, together with his conclusions as to the authenticity and state of restoration of various pictures. There is nothing of the compiler about him—he is a critic to be reckoned with. Naturally enough, he is over-enthusiastic about the artist whose works have been his special study, and greatly overrates, not the initial force of Giotto, but his actual achievement.

Inexpensive little books on art subjects multiply apace. Miss Estelle M. Hurll adds a 'Correggio' to her "Riverside Art Series" (Houghton, Mifflin & Co.); and to "Bell's Miniature Series of Painters" (Macmillan) is added a 'Watteau,' by Edgcumbe Stanley, B.A. The omission from the illustrations of the 'Correggio' of that master's great nude pictures of mythological subjects, probably thought necessary for a juvenile public, renders the selection unusually non-representative, while the inevitable reproductions from Toschi's copies are, as usual, entirely unjust to the merit of the originals. Mr. Stanley is, apparently, right enough as to his facts, and fair enough as to his criticism, but he has not made an interesting book. If he thought "the somewhat frequent use of French words and quotations . . . warranted by the peculiarly French character of art *à la Watteau,*" he should have endeavored to secure the services of a proofreader with a competent knowledge of French. "Je scarvis mon Saint Nicholas par cœur, et je ne passois d'original" (p. 9) not only is hopelessly deformed in its first clause, but conveys, in its second, tne exact reverse of the idea that Watteau meant to express. A particularly funny blunder is that on page 40, where we are told that Watteau "was especially fond of drawing the *backs* of his figures, that he might depict the various beautiful *coiffeurs* of the period." These "beautiful hair-dressers" turn up once and again in the book, to the exclusion of their handiwork, with a persistence hardly to be laid to the account of the long-suffering compositor.

'Stories of the Tuscan Artists,' by Albinia Wherry (London: J. M. Dent & Co.; New York: E. P. Dutton & Co.), is calculated for the infant mind and for the longitude of London, and need not be taken very seriously by the adult or the Westerner. The stories are not retold entirely without warning of their mythical character, but the attitude is hardly critical, and the style is somewhat goody-goody, not to say mushy.

'The Saints in Christian Art,' or 'Lives and Legends of the Evangelists, Apostles, and Other Early Saints'—we do not pretend to say which is the correct title; one is on the cover, the other on the title-page—is written by Mrs. Arthur Bell and published by Bell in London and Macmillan in New York. The plan of the book is to take up in chronological order the saints dealt with. "Wherever possible, the actual historical facts of the life of each saint are first given, then the legends which have gathered round the nucleus of truth are related. The general characteristics by which a saint may be recognized are enumerated and explained, the patronage assigned to him or her, with its reason, is stated, and examples are given of typical works of art in which the saint under notice is introduced, either as a principal or an accessory figure." The work seems to be well enough done, and will possess a certain utility for those who are anxious about the exact subject of a work of art, and, perhaps, a greater to the worried designer of ecclesiastical art.

In 'Nature and Character at Granite Bay' (New York: Eaton & Mains), Daniel A. Goodsell writes of the scenery, flowers, and birds around his summer home on Long Island Sound, of the quiet pleasures of life there, and of certain "natives" who are his neighbors. To members of the summer colony at Granite Bay the book, with its many details, will be full of interest; but few other readers will find that either subject or treatment repays the long ramble through its pages.

The Macmillan Co. publishes, newly revised and translated, Esmarch's well-known 'Surgical Technic,' edited by Senn of Chicago. Its condensed text is effectively illustrated by fifteen hundred woodcuts and fifteen colored plates. Pictures do not make surgeons, but pictures help the memory and save words.

Longmans, Green & Co. publish the illustrated fourth edition of Dr. P. W. Williams's authoritative 'Diseases of the Upper Respiratory Tract.' As greater importance becomes attached to the chronic affections of the nose and throat, the value of such special studies is more widely recognized. A particular feature of this volume is thirteen excellent stereoscopic anatomical plates, for whose better observation a stereoscope is furnished in a pocket of the cover. There are twenty-four more plates, some colored, and about 200 cuts.

In his study of the bacterial flora of cultivated soils, Mr. F. D. Chester of the Delaware College Agricultural Experiment Station found great difficulty in satisfying himself which forms were, and which were not, already known to science. He therefore arranged for his own convenience such bacteria as had already been described, and now publishes his work for the benefit of others as 'A Manual of Determinative Bacteriology' (Macmillan). He expressly disclaims that it is anything more than the name implies, for he recognizes that a satisfactory system of bacterial classification cannot be expected with our present knowledge. We believe that it will be, as the author hopes, a convenient guide for the student with cultures to identify, and as such will prove a valuable adjunct to the elaborate manuals of this microscopic science.

Dr. S. Solis-Cohen is editing a 'System of Physiologic Therapeutics' (Philadelphia: Blakiston & Co.), of which four volumes of the whole eleven have been published. Physiologic therapeutics is utilizing the natural forces of nature, as supplementary and occasionally substitutive means, rather than drug-giving, for the treatment and (more important) the prevention of disease. But the accomplished editor is careful to make it clear that he is neither antagonizing nor decrying the use of the more ordinary measures under appropriate conditions. The first two volumes are upon electro-therapy, the apparatus for generating electricity and its application in disease, by Dr. George W. Jacoby, with special articles by other competent writers. There is notoriously so much charlatanry connected with electro-therapeutics that it is refreshing to find a clearly written work, neither credulous nor skeptical, upon this force. The next two volumes, by Dr. Weber for Europe and Dr. Hinsdale for America, are devoted to climatology, sketches of health resorts, and the indications which various diseases present for climatic treatment. They form practically a medical gazetteer, accounting accurately, as far as we have been able to observe, for numberless places of every description.

'Volks- und Seewirthschaft,' by Prof. Dr. Ernst von Halle (Berlin: Mittler & Sohn), contains in two volumes twelve essays, nearly all of them more or less directly concerned with Germany's economical interests and world politics. The author, though one of the "Flottenprofessoren," is not one-sided, and sees no inconsistency in combining naval expansion with a conservative agrarian policy. The longest essay of the series, "Deutschland am Ende des XIX. Jahrhunderts" (i., 13-135), is a study in statistics which may be read with interest and profit by all who are in want of reliable information on Germany's development, mainly on the material side, since the foundation of the new empire. That the writer has obtained his material largely at first hand, that he has himself visited the countries of which he writes, appears in his essay on "Die wirthschaftliche Entfaltung Mexicos und der Weltmarkt (1901)" (ii., 84-146), and elsewhere. His discussion, on an historical basis, of American Imperialism, "Die Bedeutung des nordamerikanischen Imperialismus (1900-1901)," shows his familiarity not only with political events, but also with political methods and thought in this country. It is all the more surprising that Mr. Bryan's approval of the cession of the Philippines should have led the author into the comical error of making the Democratic candidate for the Presidency a member of the Paris Peace Commission.

In the February Bulletin of the Boston Public Library are printed two interesting papers on the counterfeiting of colony bills of credit—an evil inseparable from the use of paper money. The depositions printed at length are dated 1735 and 1739, respectively, and give a very clear idea of the methods employed by the swindlers, and of the ease with which their operations were conducted on quite a large scale. It is somewhat startling to learn that the engraver of the plates used by the Province was also willing to make plates for the counterfeit product; but the ready resort of the Government to the printing-press really invited multiplication of the bills, and the blame must lie with the legislators who put a premium on dishonesty. Was it the depreciation of the bills in circulation that led to the counter-

feiting of the notes of higher denominations —the three and five-pound notes? These legal documents open up a number of questions on the social condition of Massachusetts and Rhode Island when paper was plenty. The same Bulletin contains an interesting paper by John Marshall, and a letter from North Caroiina, dated 1721, on an Indian unjustly seized as a slave.

The mural sculptures and paintings of the Egyptians, as well as their mummies, assure us of the permanency of the type of certain of the human races for at least 5,000 years; and Miss Lillian C. Smythe, in an interesting paper on "The Ancient History of the Greyhound," in the *Stockkeeper's* Christmas Supplement, reproduces pictures of the greyhound from the tombs of Beni Hassan of the thirteenth dynasty, and from steles of about the same date, and also photographs of a wrapped and unwrapped head of a greyhound, in the British Museum, mummified about 1300 B. C. So little variation has taken place in this breed of dog that the pictures of 2500 B. C., the mummy of 1300 B. C., and the greyhound of to-day can, as pointed out by Miss Smythe, be all described with equal accuracy by the fifteenth-century rhyme:

> "Heided like a Snake; neckyd lyke a Drake;
> Fotyd like a Catte; tayllyd lyke a Ratte;
> Syded like a Braeme; chynyd lyke a Beme."

The special winter number of the *Studio* is devoted to modern designs in jewelry and fans. There are separate sections relating to the work of French, British, Austrian, German, Belgian, and Danish designers, and each is prefaced by a short sketch by a writer presumably especially acquainted with the subject. The objects illustrated show much fine workmanship and a great deal of vitality of design, but are all surprisingly alike in their diversity, being all in that style, or lack of style, which the *Studio* has done so much to familiarize us with—a style marked by a determined modernness and by "originality" at all hazards. A few of the best pieces, particularly in the French section, are beautiful as well as new, but the most are ugly as well as affected. In his preface to the French section, M. Gabriel Mourey has a few words which might well apply to the whole collection. "Such, briefly," he says, "is the modern art-jewelry movement in France. Its intensity, as one sees, is so great as to be almost alarming. Whither is it tending? Some of its excesses are dangerous; what will be the result? M. Émile Molinier, in a recent article on 'Objects of Art in the Salons of 1901,' expresses certain fears which I share. He dreads a reaction due to the eccentricities of certain artists, to their love of the outrageous and the bizarre, to their lack of proportion, both in form and in choice of material. 'It would really be a pity,' he says, 'if so promising a revival of the true artistic jewelry should come to a bad end. Happily, we have not reached that point yet, but it is a result which may soon be reached if artists continue to foist these weird things on the public. A fashion in jewelry should last longer than a fashion in dresses or in hats; but it should not be forgotten that it must rely in the long run on its appropriateness and adaptability.' "

From the publishers of the *Studio* come also the first two parts of 'English Water-Color,' with reproductions in color of drawings by well-known English water-color painters and a text by Frederick Wedmore. Here the atmosphere is as conventional and old-fashioned as in the other publication it is ultra-modern. The publishers declare that the plates are "reproduced by an expensive special process which gives the nearest facsimile effects ever yet obtained." If this be true, it shows how entirely conventional was the coloring of the older water-color painters, most of these plates being hot and brown, and with no resemblance to nature's scheme of color or to the full scale of the great colorists. Harding, clever drawing-master as he was, stands out among his fellows because he shows an appreciation of blue and green. Of the sixteen plates so far issued the most interesting is a bold sketch, by J. M. Swan, of a "Jaguar and Macaw." The work will be completed in eight parts, and each subscriber for the whole series will be presented with a portfolio to contain it.

"The Teaching of Geography," by Prof. R. S. Tarr of Cornell, in the *National Geographic Magazine* for February, is a plea for the better training of teachers, in which the foundation of a university school of geography is advocated, as well as the introduction of the Continental method of primary instruction in the geography of the home as the basis of the study of distant lands. Mr. E. J. Hill gives a rather meagre account of a trip through Siberia. He was most impressed with the great progress made in opening up the country, with its wonderful natural resources, and with the "splendid opening which it affords for the sale of American farming and mining machinery." A humorous reference to the massacre of the Chinese on the Amur is not in good taste, especially where the writer goes on to say that "a Russian gentleman told me that at Aigun alone ten thousand Chinese found a watery grave, and that the Cossacks on the Amur had been drinking vodka and living on the plunder from Mantchuria ever since."

Some noteworthy items to be culled from the Harvard College volume of annual reports (among which that of the Athletic Committee is to be regularly incorporated hereafter) are the establishment of a small experimental garden in Cuba; the recount of the Library (with a correction of former exaggerations), and "the cataloguing, either completely or partially, of some 440 uncatalogued volumes all belonging to the Library before the present public catalogue was begun, and some even going back to before the fire of 1764"; the attempt of the Prussian Government to secure Harvard's assistant professor of chemistry for Göttingen; and the flying of kites for meteorological purposes for five days on an eastbound transatlantic steamer.

The collection of the late octogenarian Comte de Limur, former Vice-President of the Société Géographique de France, is for sale to any purchaser ready to preserve it with the Count's name attached, in the interest of science. The palæontological section is especially remarkable for its primitive specimens; the mineralogical comprises 142 cases representing the entire globe, and classified according to Dufrenoy's method. Offers or inquiries should be addressed to the present Comte de Limur, Rue Thiers, Vannes, Morbihan, France.

—The sudden death of James Bradley Thayer at Cambridge, Mass., on February 14, deprives the Harvard Law School of one of its greatest ornaments, and removes a legal writer whom it would be hard to match for learning, clear and convincing exposition, and weight of authority. This journal also suffers in the cessation of a friendly collaboration covering nearly a score of years. Professor Thayer was a native of Haverhill, Mass., but received his early education mainly in Northampton, while by marriage with the daughter of the Rev. Samuel Ripley he became intimate with the circle of Concord philosophers. His Northampton experience laid the foundation of his close friendship with the late Chauncey Wright, afterwards his college classmate, whose Letters he edited biographically in 1877 in a model manner. With Concord, on the other hand, is associated his 'Western Journey with Mr. Emerson,' published seven years later. He obtained the higher education at Harvard on slender means and by dint of teaching in the college intervals. He graduated A. B. in 1852, and from the Law School in 1856, entering directly into practice in Boston as a member of the Suffolk bar, and being made Master in Chancery in 1864. Ten years later he was called to the Weld professorship in the Harvard Law School, where he added to the labors of instruction the composition of masterly text-books on 'The Origin and Scope of the American Doctrine of Constitutional Law,' 'Cases on Evidence,' 'Cases on Constitutional Law,' 'The Development of Trial by Jury,' and his great 'Preliminary Treatise on Evidence at the Common Law.' These works have been currently reviewed in our columns, and we need say no more of them than that they have fixed Professor Thayer's reputation in the very front rank of legists on either side of the Atlantic. As a lecturer he was far from fluent or decisive, but his writings were a delight to the intellect. He took a warm interest in the study of the historical evolution of law, and consequently in the fortunes of the Selden Society, the publication of the Year-books, of Bracton's Note-books, and kindred antiquarianism. His two non-legal works mentioned above prove his exceptional literary endowment, and nothing but his high achievement in his chosen profession could reconcile us to his diversion from a purely literary life. His personality was engaging. His death followed by one month the completion of his seventy-first year.

—The Oxford Historical Society, which was founded in 1884, has already brought out many learned books, and some that are readable, but volume xli. of its publications possesses quite an exceptional character. A large number of the preceding works in the same series have been closed to the generality of readers, simply because they form the material of history and are in no sense historical literature themselves. It is far otherwise with the present issue, which is called 'Studies in Oxford History,' and bears upon its title-page the name of J. R. Green (Macmillan). While the Rev. George Roberson is also a contributor, the book in the main is Green's, and bears throughout the mark of his qualities. This is quite as it should be, for the Oxford Historical Society was his creation, and has in several important respects kept to the programme of activity which he mapped out during those last months when he was so ill, yet so indefatigable. Readers of the 'Letters' will remember that Green was born

at Oxford, and though some of his academic associations were not altogether happy, he kept alive a strong affection for the town and a strong interest in the University. Mrs. Green says: "I well remember the passionate enthusiasm with which he watched from the train for the first sight of the Oxford towers against the sky." Early associations and unswerving fondness will account, then, for the writing of these essays. All of them centre about Oxford, and are conceived in much the same spirit, but they appeared at different times and differ widely in form. First comes an article on the early history of Oxford, which was originally published in *Macmillan's Magazine;* then follow twenty-two short papers on Oxford during the eighteenth century; and, finally, there are two sketches taken from the *Saturday Review*—the one called "Young Oxford," the other, "Oxford as It Is." Of the whole collection, the eighteenth-century series is decidedly the longest, and as a peculiar product of the author it deserves to stand first. It was here that Green proved his mettle when still an undergraduate, and all but unknown to the teachers of his own university. A local newspaper, the *Oxford Chronicle*, wanted some "copy," and Green supplied it, giving much better value than was required by the needs of the case. He was then reading outside the lines of the curriculum, and he took his degree without winning a place in the honor lists, but, thanks to this opportunity, he did not leave Jesus College before he had given some sign of exceptional talent. The articles on eighteenth-century Oxford rise far above the average of undergraduate attainment in the field of literature, even if we exclude the element of historical research from the praise which it deserves. They may be indebted for occasional suggestions to Macaulay's third chapter, but they are by no means an imitation of it. On all accounts we are glad that the Oxford Historical Society has honored the memory of its founder by publishing the present volume.

—'King Monmouth,' by Allan Fea (Lane), is a volume which closely resembles in guise and character the same author's 'Flight of the King.' Having already traced the escape of Charles II. after his disastrous defeat at Worcester, Mr. Fea advances a generation, and, with the aid of copious illustrations, describes the career of Charles's son. He thus in the two works traverses the latter part of the seventeenth century through nearly the whole of its course, giving many glimpses of English life in the country and at court. It would be an injustice to say that both books derive their value from the pictures, but it is only fair to emphasize the presence of a strong pictorial element. There are in 'King Monmouth' fourteen photogravure portraits, besides nearly ninety half-tone illustrations. Although some of the latter are not very well executed, the selection of subjects is in all cases good, and the reproduction of so many apartments and country houses harmonizes well with the semi-biographical, semi-antiquarian strain of the narrative. The text itself reveals a certain indebtedness to Roberts's Life of Monmouth, now more than fifty years old, but numerous documents have come to light since then which Mr. Fea uses with good effect. For example, the archives of Drayton House, Northamptonshire, which have been made accessible by the Ninth Report of the Historical Manuscripts Commission, furnish important information regarding the movements of King James's troops during the Sedgemoor campaign; and the jail-books of Taunton, which were produced by Mr. Inderwick in 1889, add fresh details concerning the results of the Rebellion. The career of Monmouth touches all the salient points of English political history from 1670 to 1685, and Mr. Fea has gleaned his material from a wide range of sources, both official and private. After all, the story remains one of an unfortunate origin, a bad bringing up, and a weak character. Monmouth's youth was set off by a little cheap popularity and a reputation for daring; circumstances made him a tool in the hands of reckless politicians, and he ended by becoming the unheroic victim of an ill-judged adventure. He lived in a bad age, and was misguided by evil companions, but under no probable conditions could he have risen to true eminence. Mr. Fea avoids all temptation to rehabilitate him, leaving his "weak and superstitious mind" to express itself through his actions. Indeed, this is a book which shuns the pathetic and romantic by keeping to a matter-of-fact strain of historical gossip. No course could have been wiser, for in the generation of Oates and Jeffreys public life was pestilential. Even Sidney and Russell have ceased to be looked upon altogether as national martyrs!

—'Maids and Matrons of New France,' by Mary Sifton Pepper (Little, Brown & Co.), is a volume of historical biography which covers the entire period of the old régime in Canada. The title is a good one and the subject is also good, for from an early date the history of French life in America is adorned by the actions of courageous and humane women. The author compares the fame of the nineteen heroines who came over in the *Mayflower* with the comparative obscurity of the French ladies who accompanied Champlain, Maisonneuve, and their successors. When writing thus, she doubtless has in mind an American audience, inasmuch as there is no disposition on the part of French Canadians to forget the worthies of their own race. Jeanne Mance is still remembered in Montreal; and that Mère Marie l'Incarnation is not forgotten at Quebec, the three volumes of the Abbé Casgrain testify. Not unnaturally, Miss Pepper fixes her attention upon the foundation of the colony more steadily than upon any other single period. The most striking names are to be met with at that time, and all the circumstances contribute to heighten the interest which springs from the story of piety and good works. After the arrival of the Carignan regiment, corruption crept in, and when it comes to the Seven Years' War, the social life of Quebec under Bigot is not a theme for the sentimentalist. Miss Pepper recognizes that Mme. de Pean is but a poor figure in comparison with Mme. de la Peltrie or Marguerite Bourgeois. Part of the subjects are drawn from Acadia, as in the case of Mme. de Guercheville and Mme. de la Tour, part from Quebec and part from Montreal. None of the essays are long and none of them contain any new material, but they are not unlikely to serve their purpose of arousing a greater interest in the women of New France than now exists among English readers. With one remark, however, of Miss Pepper we cannot bring ourselves to agree. After pointing out that members of the religious sisterhoods preceded the first batch of wives by nearly a century, she observes: "If the order had been reversed, New France might still be vying with her neighbor, New England, in prosperity and progress."

BRYCE'S STUDIES IN HISTORY AND JURISPRUDENCE.

Studies in History and Jurisprudence. By James Bryce. Henry Frowde. 1901.

Mr. Bryce's publishers have treated him rather shabbily. We should, in any case, hardly have expected the Oxford University Press to emit a volume as little attractive in paper and in binding as a public document, and of similar awkward dimensions. No volume that is to be read, and not merely consulted, ought to contain more than nine hundred pages rather closely printed in rather small type. Especially is it true that no writer so honored in America as Mr. Bryce should have his work presented in a shape to weary both the eyes and hands of his admirers. And, whether he is here peculiarly appreciated or not, his reputation is such as to make it proper to give his works a dress corresponding with their value, and one that shall adorn the libraries that they will enrich.

The value of these studies is indicated by the mere enumeration of their titles. They number sixteen, five of which involve comparison of the Roman and British empires. Three of these are technical—"Methods of Law-making in Rome and in England," "The History of Legal Development at Rome and in England," and "Marriage and Divorce in Roman and in English Law." Two involve generalizations which may be properly called magnificent—"The Roman Empire and the British Empire in India" and "The Extension of Roman and English Law throughout the World." Four essays are mainly descriptive and historical—"Primitive Iceland," "The Constitution of the United States as Seen in the Past," "Two South African Constitutions," and "The Constitution of the Commonwealth of Australia." The rest may be classed as belonging to political philosophy—"Flexible and Rigid Constitutions," "The Action of Centripetal and Centrifugal Forces on Political Constitutions," "Obedience," "The Nature of Sovereignty," "The Law of Nature," "The Methods of Legal Science," and "The Relations of Law and Religion."

Taken as a whole, these essays constitute an incomparable treatise on the legal aspects of history. Mr. Bryce observes that the longer one lives, the more is one impressed by the close connection between the old Greco-Italian world and our own.

"The current of study and education is at present setting so strongly towards the sciences of nature that it becomes all the more needful for those who value historical inquiry and the literature of the past, to do what they can to bring that old world into a definite and tangible relation with the modern time—a relation which shall be not only stimulative but practically helpful."

With this aim, Mr. Bryce has attempted, and in our judgment, with great success, to bring out the often neglected constitutional

and legal element in history, and to present topics commonly avoided, because of their supposed dryness, in a way to make them intelligible to readers who have some general knowledge of history, but little special knowledge of law. Such an undertaking is altogether beyond the powers of mere scholarship, however extensive, and must be left for the exceptional men who, like Sir H. Maine, combine with profound learning the genius for generalization and the gift of lucid expression. When we consider that these essays represent the study and reflection of thirty years, clarified and corrected by much travel and contact with men of thought and action all over the world, one may well regard them as a splendid addition to the literature of political science.

It is, of course, impracticable here to attempt any adequate criticism of so extensive a work, and we must content ourselves with a few rather haphazard observations. We naturally turn first to the essays relating to the Constitution of our own country, and note as of exceptional value the critical examination of the views set forth in the 'Federalist,' and in Tocqueville's 'Democracy in America.' The latter work is now little read, and Mr. Bryce's careful analysis amounts to a summary of its contents which will, for most purposes, supersede the original. He gives Tocqueville full credit for the elegance and refinement of his reasonings, and the acuteness of his observation. Tocqueville's book is a classic; "no book of the generation to which he belonged contains more solid wisdom in a more attractive dress." But he did not know enough of England to understand to how great an extent her institutions had been reproduced in America. Moreover, he had France always in mind, and was prone to regard as abnormal what was merely un-French; and, after all, "it is not democracy in America he describes, but his own theoretic view of democracy illustrated from America." Nevertheless, Mr. Bryce heartily testifies to the permanent merits of Tocqueville's work, and criticises it in a spirit of most appreciative sympathy.

The writers of the 'Federalist,' like Tocqueville, failed to foresee the development of the party system—a failure which has vitiated many of their predictions. This does not impeach their wisdom, for this development is a perfectly new thing in the history of the world, and there is little creative imagination in the field of politics. Their wisdom, too, is proved by the fact that none of the objections raised against the Constitution has been sustained by the event. We are inclined to question Mr. Bryce's view that the credit of the Supreme Court has not been seriously diminished. He thinks that it "may possibly have suffered slightly" because of its treatment of the Legal Tender question. Many of our best lawyers thought that its course in that matter subverted the doctrine of limited powers, and recent events have confirmed their judgment. Not long after, Chief Justice Waite, in giving the opinion of the Court in the grain-elevator cases, declared that, to correct abuses of power by the Legislature, the people must resort to the polls and not to the courts. This doctrine has been lately reaffirmed; but it is incompatible with the function of maintaining the Constitution as the supreme law asserted in the first place by John Marshall, and ever since the most important and distinctive prerogative of our courts. At the present moment we fear that most Americans, even of the educated class, regard Mr. Dooley's estimate of the Supreme Court as substantially correct.

We must reluctantly pass over without comment the suggestive chapters on Flexible and Rigid Constitutions and Centripetal and Centrifugal Forces, although they can be disregarded by no student of politics. The exposition of the Constitution of Australia has especial interest for us on account of the comparisons which it draws between that instrument and the Constitutions of the United States and of Canada. In sublimity of subject the essays comparing the Roman and British Empires can hardly be surpassed. Mr. Bryce seems to consider that oligarchies of the republican type are alone capable of building up empires, and, regarding Russia as a despotic hereditary monarchy, he has some trouble in explaining her success. But is it not explained by considering Russia as really ruled by an oligarchy? Not long since, when it was decided to expend a great sum in increasing her navy, the Czar told his Minister in effect that he knew nothing of the military needs or the financial resources of his Government, and must assume that what his Minister said was true. "Knowledge is power" is an aphorism valid in politics, and the great officers of the Russian Government know more about it than any Czar can learn.

The contrast drawn between the tasks of the Romans and the British is made striking by the clearness with which the two elements of religion and color are brought out. The peoples conquered by the Romans could be assimilated because they were of the same color as the Romans, and because neither they nor the Romans had any religion, in the modern sense. But surely Mr. Bryce goes too far in saying, "Possibly the first injunctions to have regard to religion in choosing a consort that were ever issued in the ancient world were such as that given by St. Paul when he said, 'Be not unequally yoked together with unbelievers.'" St. Paul could have found precedents enough in the Pentateuch. It must be admitted, however, that the English Governors in India have displayed an indifferentism in religion equal to that of Gallio, and have done even less in the way of persecution than the Romans. But distance, climate, color, race, and religion together render it for ever impossible that the inhabitants of India and those of England should become one people. India is ruled, on the whole, with justice, and with amazing success; but so long as she is ruled by England she will be ruled like a conquered province. "To India severance from England would mean confusion, bloodshed, and pillage." To England severance need involve no lasting injury. The possession of India adds to her fame, but not to her strength.

It is natural to ask of one who so thoroughly knows the past, what he can tell us of the future. Mr. Bryce disclaims any gift of prophecy, but occasionally his statements of what has been established by experience are precise enough to enable us to judge what may and what may not be anticipated. In speaking of flexible constitutions, he observes that the mass of a nation are, and must be, like passengers on board an ocean steamer,

"who hear the clank of the engine and watch the stroke of the piston, and admire the revolution of the larger wheels, and know that steam acts by expansion, but do not know how the less conspicuous but not less essential parts of the machinery play into the other parts, and have little notion of the use of fly-wheels and connecting-rods and regulators. . . . In the early stages of national life, the masses are usually as well content to leave governing to a small class, as passengers are to trust the captain and the engineers. But when the masses obtain, and feel that they have obtained, the sovereignty of the country, this acquiescence can no longer be counted on. Men without the requisite knowledge or training; men who, to revert to our illustration, know no more than that steam acts by expansion, and that a motion in straight lines has to be converted into a rotary one; men who are not even aware of the need for knowledge and training; men with little respect for precedents, and little capacity for understanding their bearing—may take command of engines and ship, and the representative assembly may be filled by those who have no sense of the dangers to which an abuse of the vast powers of the assembly may lead."

In the essay on Obedience this line of thought is carried further. Political obedience is not to be explained, as Hobbes and Bentham explained it, as originating in compulsion, nor with Rousseau, as the result of agreement. It is a form of compliance in general, the motives to which are Indolence, Deference, Sympathy, Fear, Reason; but the greatest of these is Indolence. It is a case of motion in the line of least resistance. Those who love exertion are exceptional men; and the moments when exertion is loved are exceptional moments. To the vast majority of mankind, nothing is more agreeable than to choose only those forms of exertion that are pleasurable and not fatiguing. This is true of the effort of thinking; to most people nothing is more troublesome.

"Protestants have been apt to assume that the natural and normal attitude of man in religious matters is independence—a wish to seek out truth for himself, a sense of the duty of consulting his own conscience; whereas the opposite is the fact, and those religious systems take the greatest hold upon man which leave least to individual choice, and inculcate, not merely humility towards the unseen powers, but the duty of implicitly accepting definite traditions, or of revering and following visible ecclesiastical guides."

It may be admitted that in so far as the exercise of Will implies a conscious exertion of rational choice, it is characteristic of Man alone. But in most men the want of individual Will—that is, the proneness to comply with or follow the will of another—is the specially conspicuous phenomenon. This explains the history of the East; this shows how political theories must be modified:

"The abstract love of liberty, the desire to secure self-government for its own sake, apart from the benefits to be reaped from it, has been a comparatively feeble passion, even in nations far advanced in political development. . . . It used to be believed, perhaps it is still generally believed, that, with the advance of knowledge, the development of intelligence, and the accumulation of human experience, Obedience must necessarily decline, and that therewith governmental control will decay or be deemed superfluous, the good sense of mankind coming in to do for themselves what authority has hitherto done for them."

Experience has not justified this belief, and we must conclude that the

"theoretic democratic ideal of men as each

of them possessing and exerting an independent reason, conscience, and will, is an ideal too remote from human nature as we know it, and from communities as they now exist, to be within the horizon of the next few centuries, perhaps of all the centuries that may elapse before we are covered by the ice fields again descending from the Pole, or are ultimately engulfed in the sun."

The tendencies of human nature which make for obedience, Mr. Bryce concludes, have not become, and are not likely to become, less powerful than they were. There is less compulsion than of old in the sphere of religion, physical force plays a smaller part than in the ruder ages. But Indolence, Deference, and Sympathy, rather than Reason and the pride of personal independence, have filled the void which the less frequent appeal to physical force has left. Do the events of the last seventy years, during which power has, at least in form and semblance, passed from the few to the many, encourage the belief that the spirit of independence, the standard of public duty, and the sense of responsibility in each individual for the conduct of government are really advancing? The events of the last few years in England and America answer the question. The most that a reasonable optimist may venture to hope for is, that "the masses" of democratic countries in the future, since they must follow a small number of leaders, will attain such virtue and wisdom as to select the right leaders. To hope for more than this is to hope for what history affords little reason to believe is attainable.

ROSS'S FLORENTINE VILLAS.

Florentine Villas. By Janet Ross. With reproductions in photogravure from Zocchi's etchings, and many line drawings of the villas by Nelly Erichsen. London: J. M. Dent; New York: E. P. Dutton & Co. 1901.

The stately villas among the olive-clad hills of Florence are one of the city's charms. They invite attention by their importance in the landscape, catching the sun's rays like jewels among the trees. There has been hitherto no book devoted to their history, so that Mrs. Ross's sumptuous volume supplies a distinct want. The reproduction of Zocchi's etchings from 'Vedute delle Ville ed altri luoghi della Toscana,' published in 1744, is a happy inspiration, for we thus see many of the villas as they were meant to be, surrounded by groves of trees and formal gardens, their true setting; while now a host of small and unimportant houses cover the land and destroy the architectural effect of these splendid summer palaces. Zocchi is little known as a painter; he decorated the Serristori and Rinuccini palaces, and died in 1767. Besides these etchings, the book is full of recent drawings by Miss Nelly Erichsen, who gives us all that is most picturesque and characteristic of Tuscan gardens, so that we can compare what was with what remains, and congratulate ourselves that nineteenth-century progress, even at its worst, has not been able to spoil the character of the Florentine countryside.

It was during the Medicean epoch, when a more luxurious manner of life became usual, that architects such as Michelozzi, Ammannati, and Buontalenti were called in to adapt ancient villas till then more like fortified castles, or to build new ones more fitted to the requirements of the age. The villeggiatura, then as now, was regarded as indispensable. In order that the various members of a family might install themselves with all their belongings in their country villas for the summer months without friction, it was necessary that plenty of space should be available. The Medici owned at one time or another the majority of the most important villas. We shall come to them later, for Mrs. Ross begins the series with the Villa Palmieri, now belonging to the Earl of Crawford, to which Queen Victoria came in search of sunshine and rest in the spring of 1888 and again in 1893. Its earliest association is with the Decameron. Baldelli, in his Life of Boccaccio, tells that this writer owned a little villa at Maiano and therefore described the surrounding country. Poggio Gherardo, Mrs. Ross's present home, Baldelli recognizes as the first halting-place of the Decameron party, and the sumptuous Schifanoia (now the Palmieri Villa, then belonging to Cioni de' Fini), as the retreat for the second day. In the fourteenth century Schifanoia (otherwise "Banish Care") was bought by the Tolomei and called Palazzo de' tre Visi, because of a bas-relief of the Trinity or a fountain with the head of Janus. It was next bought by Matteo Palmieri, whose descendant Palmiero Palmieri in 1670 transformed it into the beautiful palace it is now and gave it his name. He built the long archway across the road under which the brothers of the Misericordia of Florence met with those of Fiesole in the olden time, and were allowed to rest and have a drink of vinegar and water, after the steep climb. Now that the road has been deviated, the confraternities may be seen resting in the little garden of the entrance.

Another villa on a site which Boccaccio has described is that of Font all' Erta. Roberto Gherardi tells how the fountain was diverted about the year 1710 because it damaged the crops and chilled the land. This fountain was below the villa belonging to the Gaddi family, descendants of the painter Taddeo Gaddi, the friend of Dante. Our author tells us that at the time Florence was being furbished up to become the capital of United Italy, when the old road was being turned into the new boulevard, the remains of a water conduit and cistern of old Roman work were discovered, together with a sacrificial knife, human bones, and fragments of Roman pottery. Above this spot a white spectre like a cloud of moving mist had often been observed, but never appeared again after the new road was made; which would prove that spectres have a sense of fitness. It was Niccolò Gaddi, heir to the property in 1558, who gave the villa its present form. The loggia is supposed to have been designed by Ammannati. Niccolò was illustrious in every sense of the word. Duke Cosimo gave him the mission to announce to the Dukes of Ferrara and Mantua his promotion by the Pope to be Grand Duke of Tuscany; he was Senator also, and had many public charges. His own library, picture gallery, museum of antiquities, were second only to those of the Medici. The Laurentian and Magliabecchiana now possess the greater part of his manuscripts and rare editions; besides which he delighted in his garden, filling it with rare shrubs, trees, plants, and medicinal herbs. It is to Niccolò Gaddi that Florence owes its botanical garden.

Facing us from Font all' Erta is the Landor Villa, belonging to Prof. Willard Fiske. The River Affrico runs through his grounds, and the valley of the Ladies is recognized as being below his garden walls. The lake, of course, has long been filled in. Font all' Erta has been in recent times full of interesting associations, for it was bought in 1850 by Count Giuseppe Pasolini, one of the most distinguished of the patriots who worked for the regeneration of Italy, and here in his villa all the great Liberals met together and deliberated. The villa now belongs to his daughter, the Countess Rasponi della Testa.

The villa of Poggio Gherardo, so different in character from the two villas we have described as connected with Decameron lore, resembles a mediæval castle. Its history dates back to 1321, when Meglino di Magaldo Magaldi left by will the greater part of his property to the Congregation of the Visitation. It was evident that this man had sins to score with heaven, for the object he desired to attain by his munificence was a daily mass for the repose of his soul. His heirs initiated a law suit, but the Congregation got permission from the Cardinal Legate of Pope John XXII., who was at Avignon, to sell the estate; so the villa was sold to two Baroncelli brothers, passed later into the hands of the Albizzi, and later still of the Zati, who sold it in 1433 to Gherardo di Bartolomeo Gherardo. In his family it remained for 455 years. We remember it some years ago in its mediæval grandeur and isolation, a most melancholy and desolate castle, too solid for decay, but entirely untouched by the movement of the present time. It was bought in 1888 by Mr. H. J. Ross, and transformed in many ways, being the home of his well-known collection of orchids. Mrs. Ross tells us that Poggio Gherardo was originally one of the frontier castles which defended Florence from the people of Arezzo and the Casentino; the line of castles with towers, beginning with Castel di Poggio, Vincigliata, and Poggio Gherardo, then extending across the valley and up the opposite bank of the Arno. Poggio Gherardo stands three hundred feet above the plain, and has weathered many sieges; its eastern wing was destroyed by Sir John Hawkwood, and never entirely restored. Roberto Gherardi, at one time the owner of the castle, wrote an interesting account of the country around, which has never been printed ('La Villeggiatura a Maiano'). From this work Mrs. Ross quotes freely. He was evidently much interested in Boccaccio's connection with the neighborhood, and shows great ingenuity in his identifications, which must naturally be treated as pure conjecture, as also his idea that Boccaccio was born near the banks of the Mensola.

The Medicean villas occupy the greater part of Mrs. Ross's book. There were few important villas which did not, by marriage or by right of confiscation, fall into the hands of some member of the family, besides those expressly built for them. Poggio a Cajano, about ten miles from Florence, founded on the ancient castle by Giuliano di San Gallo for Lorenzo the Magnificent, is so like a fortress, with its bastions and solid walls,

that the Emperor Charles V., after spending a day there in 1536, created the bastard Alessandro de' Medici Duke of Tuscany, as he regarded the villa unfit for a private citizen. Andrea del Sarto, Franciabigio, and Pontormo, by order of Leo X., decorated the hall in later years with frescoes recording the glories of the Medici. Great festivities took place there in 1539 when Cosimo I. brought his bride Eleanor of Toledo for five days to the villa, on their way from Pisa to Florence. Twenty-six years later, their son, Francesco, met his bride, Joan of Austria, there; and after her death and his secret marriage with his mistress Bianca Capello, it became the favorite residence of the Venetian Grand Duchess, and was the scene of the shooting party in honor of Cardinal Ferdinand, brother and heir to Francesco, which ended with the tragedy of the death of the Grand Duke and of Bianca—whether through her own frustrated attempt to poison the Cardinal or through the latter's deed, remains uncertain.

Cafaggiuolo, although eighteen miles from Florence, is too intimately connected with the Medici to escape mention. According to Vasari, Michelozzo Michelozzi built this palace in the Mugello in the guise of a fortress for Cosimo the elder. Cafaggiuolo was a favorite resort of Lorenzo and Giuliano de' Medici and their friends the Pulci; they found subjects for their poems in their intercourse with the peasants at the fairs and the weekly markets. After the murder of Giuliano by the Pazzi conspiracy, Lorenzo sent his wife and children there for safety with Angelo Poliziano, their tutor, and the Bishop of Arezzo.

The question of the pottery bearing the name of Cafaggiuolo has excited much bitter controversy among the *cognoscenti*. Some assert that the pieces signed Cafaggiuolo were made by a family of Faenza, the Ca' Fagioli. Mrs. Ross cites documents printed in the *Athenæum* to prove that, in 1485, kilns existed in the district. Baccini also mentions, in the list of Cosimo I.'s possessions in 1566, that there were kilns used by potters, makers of vases, and decorative ware (*vascellai*), two of which were near the villa rented by Jacopo di Stefano. Mr. Ormy E. Fortnum, who has a list of Cafaggiuolo ware in his work on majolica, with the marks of the most characteristic pieces, chiefly letters, does not explain those marks, but Signor Baccini supposes them to be the initials of different members of a family from Montelupo, who went to Cafaggiuolo to make the *bocali*—a certain Piero, whose son was Stefano di Piero, and grandson Jacopo di Stefano, above mentioned as the tenant of the kilns in 1566.

It was in 1417 that Cosimo de' Medici bought of Tommaso Lippi, for 800 florins, "a palace with a courtyard, a loggia, a wall, archways, dovecotes, a tower, a walled kitchen-garden, two peasant-houses, and arable land, vineyards, olive groves, and spinnies, in the parish of Careggi," on the hillside which Varchi mentions as "the most delightful hill called Montughi." Michelozzi, Cosimo's favorite architect, was commissioned to turn the place into a castle with battlements, covered galleries, a tower, a drawbridge, and high walls round the gardens. Here Cosimo spent all his leisure from state affairs, with the most distinguished men of the time in literature as in art; here, too, his long life ended in 1464. His son Piero survived him only five years, and was succeeded by the famous Lorenzo, the story of whose death at Careggi is too well known to require telling. After the Medici had been expelled from Florence, Dante and Lorenzo da Castiglione, with other young men, set fire to the villas of Careggi and Castello. The former was much damaged, but the thick walls remained, and Alessandro attempted to restore it to its former splendor when death interrupted his work; he was murdered by Lorenzino, his cousin.

Petraja. Castello, Villa dell' Ambrogiana, Pratolino, Villa Ferdinanda a Artimino, are also Medicean villas, all full of interesting records, which Mrs. Ross presents with ample historic documents. She has been very generous in quoting her authorities, and has had great advantages in obtaining inaccessible sources of information. While telling us about the villas, our author gives us all the history and romance of the people who have inhabited them, descriptions of all the pageants, functions, and ceremonies of which they have been the scene; the crimes they have been witness to—nothing has been withheld. The edition is of only 300 copies.

Famous Houses of Bath and District. By J. F. Meehan. With an Appreciative Introduction by the Marquess of Dufferin and Ava. Illustrated with about sixty reproductions of original drawings and rare prints in the possession of the author. Bath: B. & J. F. Meehan. 1901. Pp. xiv, 228.

Ancient Royal Palaces in and near London. Drawn in Lithography by Thomas R. Way, with Notes compiled by Frederic Chapman. John Lane. 1902. Pp. vi, 175.

Our columns have recently made room for extended descriptions of a three-volume book on some English country houses of the first rank, with their extraordinary surroundings and as extraordinary contents. Now we have to mention a very curious attempt on the part of a Bath bookseller to deal with the houses in and near his beloved city. It is a readable book, for it contains an interesting collection of ana concerning very interesting people. Marshall Wade, the famous maker of those Scotch roads which were so bad "before they were made"; Gainsborough, the painter; Dr. Johnson; Beckford, the tremendous millionaire of the close of the eighteenth century, and the unlucky builder of Fonthill; Shelley and Mary Godwin; Jane Austen, Hannah More, and, supremely important, Beau Nash himself—these are the men and women who lived in Bath for a part at least of their lives, and who have left associations and legends behind them. The illustrations are without merit except this, that they manage to furnish portraits of a certain accuracy of various old houses now gone or altered out of recognition. There is no material here for the delectation of the architectural enthusiast; but there is something for the collector of documents, and he will be glad to study the view of Milsom Street and the more attractive architectural presentation of Shockerwick House.

The second book named above is of a very different character. It has a cloth binding of royal purple with a sowing of Tudor roses, and this splendid outside prepares us for the dithyrambic character which is given to the text. The keynote is struck in the preface, in which it is stated absolutely that the "thirteen palaces or remains of palaces near London" constitute "a more splendid collection of buildings of the kind than any other country can boast of." The reader who is familiar with the buildings is more capable than another would be of sympathizing with the writer, and to understand aright what he means; for, as the next paragraph goes on to say, Westminster, Eltham, Hampton Court contain among them "an unsurpassable trio of Gothic roofs," and it is also true that "Hampton Court is far too living a palace to be allowed to drift entirely into a museum and picture gallery." In like manner, one who knows some of the ins and outs of Kensington Palace, the Banqueting House at Whitehall, and the Tower of London will understand the possibility of an Englishman's enthusiasm. The difficulty is, of course, in the mistaking of these domestic, tranquil, unambitious buildings (whether from that category Hampton Court be excluded or not) with the far more stately buildings that cluster around Paris or are grouped in Berlin and its suburb, Potsdam. But it is fair to say that there is not much insistence on the supreme importance and dignity of the English palaces; it is only now and then that the patriotic touch of exaggeration comes in, while indeed the text deals generally with the historical and semi-historical records of the people who lived and attended to the business of state within the walls of these royal structures rather than with the walls and the roofs themselves.

The peculiar value of this book is, however, the very considerable collection of lithographs which it contains, twenty-four in all; the work of a recognized master in this newly revived art, and all of them treated with express reference to the picture-like quality of the scene represented. They are an interesting lot, and separate plates of the series will undoubtedly become important to collectors. At the same time, it is not to be assumed that each is an important work of art. The simplest ones are naturally the best. The little view of Eltham Palace opposite page 4 is a charming and tranquil picture with great unity of composition, and with even an agreeable reminder of the work (inferior to it, however) of seventy years ago. A contrast to it is afforded as well by the Whitehall view opposite page 56 as by some others. That is a print which seems entirely without artistic significance.

The Furniture of Our Forefathers. By Esther Singleton. With critical descriptions of plates by Russell Sturgis. In eight parts. Doubleday, Page & Co. 1901.

Colonial Furniture in America. By Luke Vincent Lockwood. Charles Scribner's Sons. 1901. Pp. xix, 352. Twelve artotype plates, 293 half-tone cuts in text.

The lively interest nowadays taken in the early history of our country and in the manners and customs of our ancestors has justified the appearance of several books upon their furniture. The subject receives its most extended treatment in Esther Singleton's 'Furniture of Our Forefathers,' which aims to include examples of all the kinds of furniture in use in the American

colonies from the time of the first settlement at Jamestown to the decline of taste in the early nineteenth century. For many people the chief interest of the book lies in its illustrations, which cover a great range and include pieces of every kind without regard to their origin, provided only that they have at some period been in more or less common use in our own country. To the index to these plates are added notes, sometimes by Esther Singleton, sometimes by Russell Sturgis, which, being historic and critical, are of great value in bringing out points of interest that might not be evident from the plates alone. Mr. Sturgis, in particular, has the faculty of peering into an illustration so closely as to find something well worth saying about it, something which the average reader, unused to the designer's point of view, could scarcely hope, unaided, to find in it, even by the most careful scrutiny.

The text is historical and descriptive. It deals with the course of furniture design in Europe and America from Jacobean times to our own. It enters largely into the question of how the homes of the various classes were furnished at any given time and in any particular part of the Colonies. Original sources of information have been largely consulted, and much space is occupied in reproducing ancient inventories which describe the personal belongings of people in many stations of life. At times such descriptions are worded with reasonable precision, at times with maddening vagueness. Often their interest is heightened by an exact valuation of the articles named. These inventories are the most prominent feature of the earlier parts of the book, but in the later periods the inventories are no longer needed, since many mansions are known in which the old furniture is still in its original position. Descriptions of these houses and their furniture then become the dominant note of the text and serve to maintain its interest. The book is excellently got up. The type is large and clear, the margins wide, the half-tone plates of a high order, and the pen-and-ink drawings scattered through the text are clear and crisp.

Mr. Lockwood furnishes the collector and connoisseur a most useful hand-book, that treats its subject in a systematic and reasonable way. The information contained in it is well arranged and well digested, not merely brought together by accident from scattered sources, as is too often the case in books about old furniture. The method adopted is to treat each class of objects—for example, chairs, tables, chests—in a separate chapter. Such a method demands at some point a discussion of style in furniture and a handling of the history of the furniture of the period covered by the book. This the author gives very satisfactorily in an introduction, in which he points out the intimate relation between the early furniture of this country and that made about the same time in England and Holland. Changes in the design of furniture so plainly reflect political and commercial history that some consideration of such history is most desirable. In tracing the course of style in furniture, changes in politics and commerce are therefore closely followed, and their relations to the furniture of any given period clearly brought out. The introduction constitutes an essay on the history of furniture in the American Colonies of most excellent clearness and breadth, yet of sufficient brevity to avoid the weariness inevitable in an extended pursuit of such a subject.

The plan of treating each class of objects in a separate chapter makes it easy to consult the book for the purpose of gaining information about a given piece of furniture. For instance, should one wish to know about a highboy with bandy legs, scroll-and-flame top, shell enrichments, and pillared angles, he would naturally turn to the chapter on chests of drawers, where, among the many illustrations of such pieces, he would find one of the kind described, and from the text he would soon discover that such highly elaborate chests were of late date, generally made of walnut, that they are found chiefly in Pennsylvania and Virginia, and that five of them, differing slightly in design and detail, may be examined in the Pendleton collection at Providence, R. I.

Detail begins with a chapter on chests. These, at first simple, become later quite elaborate, and by the addition of drawers afford an easy transition to the second subject, that of chests of drawers, which, passing into bureaus, lead to cupboards and sideboards. Chairs occupy a large part of the book, and merge naturally enough into settles, couches, and sofas, which in turn give way to tables. Desks and scrutoirs follow, and the book ends with chapters on mirrors, bedsteads, and clocks. There is no better systematic treatise on Colonial furniture than that of Mr. Lockwood. Although we have spoken of it as a hand-book, it is such only in so far as it is a compact treatment of a large subject. In reality its form is that of a handsome volume (8x11 in.), well printed in large clear type, and illustrated with artotype plates and half-tone cuts of admirable quality.

Dreiunddreissig Jahre in Ost-Asien. Von M. von Brandt. Leipzig: Georg Wigand.

The portraits serving as frontispieces in this brace of volumes of the reminiscences of a German diplomatist are in themselves eloquent. The one is of a handsome old man of the Occident in 1900, and the other of a very young one of the Orient in 1871. They suggest the fascinating story of two great movements—the one of the winning by Germany of a strong place in the politics of the Far East, and the other of the advance of Japan. As we remember the young German Minister of thirty years ago, alert, scholarly, keenly perceptive, and intensely energetic, the contrast with the man of snow-white hair and beard whose kindly, penetrating glance meets us to-day, is suggestive. Von Brandt is the very incarnation of Germany's part in the Far Eastern question. The frontispiece in the second volume is that of the Mikado, Mutsuhito, as we remember seeing him in the palace in '71, with flowing robes of vast amplitude, with his feet cased in stub-toed, bright-colored footgear half a foot above the floor-matting, and an upright stiff pennant of gold rising from his black lacquered cap two feet into the air. He was then a young man only eighteen years old. Now, wearing always in public the dress of a modern sovereign, he is a grandfather and soon to pass a half-century. From Tycoon time to Japan's entrance into the world's commonwealth as an equal and a Power is the space covered in Herr von Brandt's mature lifetime.

In literary quality these two volumes are a delightful surprise. The author wields a practised pen, as those familiar with his diplomatic papers and articles written for the German Asiatic Society know full well. His style is clear and vigorous, and his matter readable. Von Brandt has a keen sense of humor, and most of his judgments are tempered by a charity that belongs to sunny and healthy old age. If rumor has it right, his exit from German diplomatic service after thirty-three years of pioneering and masterful influence was hastened by his marrying an American wife. Certainly his criticisms on Americans are genial and appreciative, without a trace of bitter sarcasm. Indeed, he seems to be severer on the Germans in America than upon the natives of the great republic. He scores his cis-Atlantic countrymen who have gone into politics, for their lack of patience in working out attainable results, and for losing vast benefits because they dreamily expect something better too soon. It will reward, even if it mildly humiliates, some German-Americans to see themselves as they are reflected on these pages.

There seems to be in Von Brandt a strain of the matter-of-fact Englishman rather than of the idealistic Teuton. Perhaps his having spent most of his life away from his own country and among English and Americans has made him, what he is, a very practical and very successful diplomatist. We imagine that Mr. Townsend Harris, of whom he speaks so appreciatingly, and with whom he came in contact very early in his career in Yedo, had a powerful influence upon him at the start. When the Germans had no standing interests and few beyond those of trade in the Far East, Germany itself being (in the East, at least) little more than a geographical expression and without a navy, Von Brandt went out in the Prussian Expedition to Japan in 1860, arriving there just after Mr. Harris had, without a ship or a soldier, by patient tact and courtesy, made his triumphant entrance into Yedo. We have more than once heard the New Yorker tell of the bright young German fellows in Yedo, to whose chief he loaned his secretary, the Dutch-American Heusken, during the Prussian negotiations. Naturally, Mr. Heusken preferred to spend his evenings with cultivated young men of his own age rather than with an elderly gentleman in a lonely temple, when Yedo had not a score of white men within its vast area. The fact of his frequently riding or galloping at night, during a time of political strain, with his occasional disregard of Japanese proprieties, resulted in his assassination. The story of this episode and of his burial forms a pathetic page in the Reminiscences. Yet while all the other foreign envoys left Yedo and retreated to Yokohama, Mr. Harris, following the Japanese advice, kept in at night and also kept the stars and stripes flying in Yedo.

Herr von Brandt's chapters on Nagasaki, Tientsin, Peking, Canton, and Siam are interesting as clear word-pictures of thirty years ago. Evidently he was in the fulness of health and enjoyed every moment. Appointed Consul, he returned to the Mikado's

empire, reaching it at a time when the already century-old process of inward forces and tendencies toward revolution had been quickened by the presence of foreigners. He tells again the story of Shimonoseki—in which bombardment the Germans had no ships or men—the fall of the Yedo usurpation or shogun's government, and he also explains why he did not accept audience of the Mikado in Kioto when first granted, early in 1868. He feared the young Emperor could not control his fanatical subjects. His surmises of evil were fully justified when two patriots, filled with bigotry, and also with saké rich in fusel oil, ran amuck among Sir Harry Parkes's cavalry, and in five minutes had wounded eleven men and five horses. A trip in Yezo is most vividly described (for Von Brandt is a wide-awake traveller), as is likewise the first year of the new Japanese civilization, when Yedo became Tokio. After a run across America in 1871-72, he returned to Japan to take a very active part in forwarding German interests, though he was unable then, as before or afterwards, to carry out the scheme of Bismarck in behalf of German colonization and the purchase of the island of Formosa; the logic of events making that island first the subject of invasion and afterwards of possession by the Japanese. In 1873, in Tokio, he organized the German Asiatic Society, which has done such creditable work in investigation and publication. Of his appointment to China and his work there, another volume is expected to tell. It is rare, we imagine, that a diplomatist writes in the first person so frankly and engagingly.

The Sherbro and its Hinterland. By T. J. Alldridge, F.R.G.S. The Macmillan Company. 1901. 8vo, pp. xvi, 356. Maps and illustrations.

There is a special interest in the accounts which the builders of the British Empire occasionally give of their work, apart from any literary or scientific merit they may or may not have, for they are generally practical demonstrations of the best examples of governing savage or semi-civilized peoples. In this book the preliminary work of bringing a number of mutually hostile tribes to acknowledge one supreme authority, not by force, but by persuasion, is described. The Hinterland of the Sherbro, a district of Sierra Leone, was made some ten years ago a British protectorate, and Mr. Alldridge, the Commissioner, was directed to visit the principal chiefs and invite them to enter into friendly relations with his Government. This necessitated long and dangerous journeys into regions hitherto unvisited by white men, and demanding no little courage and endurance, as well as great patience and tact. His success in treaty-making and in winning the confidence of the chiefs was remarkable, and causes the reader to overlook the crudities of style and the frequent dulness of his account of these expeditions. The book is full of descriptions of the unexplored interior and of the distinctive manners and customs of its inhabitants; the more trustworthy as they are not the observations of a mere passing traveller, but of one who has spent thirty years in the Sherbro. He dwells upon the rich natural resources of the land, its palms, rubber-plants, and fruits, its rice, coffee, and cotton, and looks forward confidently to the day when, a profitable export market being provided, the native will be led to develop this wealth. Of mineral deposits he says nothing, but the fact that the chief currency among some of the tribes was long strips of iron would seem to indicate the existence of ore beds. The natives of the interior are represented as intelligent, naturally industrious, and as displaying much skill in the weaving and ornamenting cotton cloth and in making pottery. Some are very observant. A chief carrying a bright iron spear came close to a mariner's compass which was in Mr. Alldridge's hut and the needle immediately vibrated. The motion caught his eye and he asked its cause, and on the next day, at the end of a meeting at which a treaty was signed, requested that his people might be shown it.

"I had the compass brought, opened, and allowed the needle to become quiet. He requested as many of his people as possible to stand round while he, in the most dignified way, brought his spear near to the compass, when, of course, the needle was considerably excited. After the needle was again motionless, I told him to take a silver armlet from one of his wives and to touch the compass with it. He did so, when the non-movement of the needle caused a general look of surprise upon the faces of the people."

They hold political meetings in which they discuss public affairs

"with deliberate caution and great dignity. The whole debate, in fact, is carried on with the greatest quietness, ceremony, and politeness, and often filled me with profound amazement, and afforded me infinite pleasure. At these times it was difficult for me to realize that I was in a so-called uncivilized country—for certainly the manners of these parliamentary hands, in their abstaining from personal invective and recriminations, were polished to a very remarkable degree. It struck me forcibly that many a lesson might be gathered from the dignity, the courtesy, and the general friendliness which these tribes showed—not only towards a stranger, but in their every-day life towards each other."

Considerable space is given to an account of the secret societies which, before the establishment of British law, entirely ruled the natives, and are still of great importance, and an "enormous force both for good and evil." Mr. Alldridge describes their initiation ceremonies and many of their customs, but acknowledges that he has never succeeded in penetrating the inner mysteries, and is satisfied that no outsider knows what the secrets really are. An ordinance against one of the society methods was a principal cause of the insurrection of 1898, of which a brief account is given. Another was the suppression of the slave-trade, to which the incessant tribal wars were wholly due. To defend themselves against these raids, the natives surrounded their villages by war fences. These were (for they are now not allowed by the Government) live trees, the lower part being kept free from foliage, but interlaced with a rude lattice of long live canes that also sprouted, making a dense mass of vegetation from fifteen to twenty feet high, with a gate formed of a solid slab of hardwood. Every town had from two to four of these fences, and in one instance there were ten.

Mr. Alldridge gives a brief sketch of life in a coast town, and refers to the eagerness of the better class of natives for education. Many of the well-to-do among them have sent their sons to England to receive a thorough medical training, and these are "to-day duly qualified medical officers, holding high appointments in the Government service." In fact, there is not an official in his district who is not colored. His main object, however, is to inform his countrymen about this almost unknown part of the empire, the hinterland, and to interest them in the industrial development of its inhabitants. He also shows by many graphic touches the hard and self-sacrificing life of the English official among them. Two maps and numerous photographs, some of great beauty, illustrative of scenes and incidents or people mentioned in the text, add to the value and attractiveness of the volume.

The Tale of the Argonauts. By Apollonius of Rhodes. Translated by Arthur S. Way. London: J. M. Dent & Co.; New York: Macmillan. 1901.

Apollonius adopted the epithet "Rhodian" out of gratitude for the generous welcome that met him in Rhodes when the stress of hostile criticism drove him from the cultivated court of Alexandria. Callimachus and his clique of pedants felt that an Alexandrian philologian who had ventured to write an epic of six thousand verses in the style of Homer had put himself outside the pale of their patronage. Indeed, the world of letters has never wholly revoked their verdict, for literary critics are rightly shy of a *tour de force* in poetry. To compare great things with smaller, it was like Mr. Le Gallienne rewriting FitzGerald's 'Omar,' though the parallel is unfair to Apollonius, because he actually succeeded in turning out a sort of masterpiece. He is always labelled with a qualifying phrase: Quintilian in his day said the poem flowed "with a sort of even mediocrity"; and Longinus, with the captiousness of the true critic, complained that Apollonius never makes a false step, whereas we all know that Homer nods. In all this faint praise there is much injustice. Virgil, at any rate, thought the poem good enough to plagiarize, and his admirers are prone to forget that the famous Dido episode is in parts a close imitation of the 'Argonautica,' while not a few of Virgil's oft-quoted similes are derived from Apollonius. In our own day he inspired the 'Life and Death of Jason.'

'The Argonauts' is not a great national poem like the 'Aeneid'; an Alexandrian living on the threshold of the mysterious East, Apollonius "heard it calling," and his fancy delighted to paint the savage scenery of the Caucasus, and the gloomy seas and lowering skies that attended the Argonauts to Colchis. It was as though he challenged himself to take up certain opportunities that Homer had let slip for moving and magical adventures in "perilous seas and faery lands forlorn." In his epic he shows the defects of his period and his school. The adventures are too successive, so that the poem tends to become a mere itinerary—a most thrilling one, it is true, but there is too much that is irrelevant to the working out of the drama, and there is a wealth of picturesque detail that is overflorid to a taste trained in the fine simplicity of Homer or the impressive outline manner of Virgil. The Alexandrians were at once very Greek and very modern. But even those who insist on the weaknesses of

the poem as a whole must admit the unmistakable beauties of the Third Book, with its description of the passion of Medea. This is not the baleful Medea of tragedy, but a charming compound of *jeune fille* and sorceress. The 'Argonautica' is a love poem, and here we meet the Alexandrian attitude to women. The pathos of Medea's early love for Jason, so strikingly absent from Euripides, is a strong *motif* in Apollonius. Unfortunately, he did not end his poem with the taking of the fleece and Medea's flight; and so the return adventures, in which the less agreeable side of her character is emphasized, are inevitably an anticlimax.

There are two English verse renderings of Apollonius, long out of print; and since they were in the manner of Pope, we need not regret their scarceness. Mr. Way is well known for his excellent verse translation of the plays of Euripides, and he has all the equipment of the successful translator. But in choosing the sixteen-syllabled verses familiar to readers of William Morris's 'Sigurd the Volsung,' Mr. Way lighted on a most difficult medium. Even Morris could not avoid an awkward line now and again, and Mr. Way has by no means succeeded in giving the general effect of smoothness attained in 'Sigurd.' Sometimes the awkwardness is due to the shifting of the accent to an unnatural place, as is occasionally inevitable in this metre; but, from whatever cause, there is a heavy, tumbling effect about Mr. Way's version that is far from reproducing the "carrying-on-ness" of the Greek hexameter. We have too many such lines as

"So in sweetest communion did these try each the other's heart,"

or

"That, as he fought in the shock of the meeting ranks, he should have."

It is an athletic feat to read aloud several continuous pages of Mr. Way's translation. It is seen at its best in passages like the following, where Medea addresses Jason:

". . . 'So the golden fleece unto Hellas, if this be all,
From Aia afar shalt thou bear: oh yea, turn thou and depart,
Whithersoever it pleaseth thee; seek the desire of thine heart.'
She spake, and her eyes to the earth at her feet in silence she cast;
And her cheeks, divinely fair, were wet as her tears fell fast,
As she sorrowed because that far and afar from her side o'er the main
He must wander away. And she looked in his eyes and she spake yet again
With mournful word, and his right hand now hath she ta'en in her own;
For the shamefastness now from her eyes on the wings of love had flown:
'But, oh remember, if ever thou com'st to thine home afar,
Medea's name; and in like wise I, when sundered we are,
Will forget thee not.' . . ."

Apart from his metre, Mr. Way's translation is most successful. It is scholarly and well sustained, and will doubtless hold its place for some time to come as the best translation of the 'Argonautica.' It is got up in the charming and convenient style of the Temple Classics, and contains a useful epilogue on the life of Apollonius. It is a signal opportunity for those who are unable to read the original to make the acquaintance of a new type of epic, the Alexandrian, in which, true to the preoccupations of Alexandria, love plays the leading part.

Glories of Spain. By Charles W. Wood, F.R.G.S. Macmillan Co. Pp. xxiv, 498. 85 illustr. 1901.

Mr. Wood has invented a new *genre*. Genius from time to time has taken journeys more or less sentimental and whimsical in search of the picturesque, and has recorded its sensations and ideas in free creations of its fancy. Plainer-minded journeyers either recorded what they saw, or drew a large and clumsy bow in travellers' tales of what they did not see. But the creations of genius have no such crude ineptitude; they show what should have been seen from each mount of vision even though the stage was bare. They, like the god floating through the atmosphere of a Greek landscape or the siren voices heard on a wave-beaten shore, labor with Plato's poet to complete the broken round of nature and to give to it meaning and interpretation. But this precious ore, from Sterne to Longfellow, has lain in a single vein, and, like genius always, has refused a second working. There is only one 'Sentimental Journey' and one 'Hyperion.' For Mr. Wood it has been reserved to reduce this process of poetry to the reduplicating power of an automatic machine, and to have produced, so we gather from the advertisement, at least four books in this his own *genre*.

To judge from the present specimen, he is quite an artist in his way. Sterne might have come back from the shades to write some scenes, but it would have been a Sterne purified in purgatorial fires, his wantonness departed and with it his genius. At the opposite extreme, the whole book is steeped in the atmosphere of those "Annuals" which were the delight of the first half of the last century, precious yearly periodicals, by no means of protest, but of an elegant and dapper romanticism. So Mr. Wood works out his romantic progress through Spanish cities, meeting with more adventures than Don Quixote, and these more astonishing. The itinerary is brief; this is no clumsy traveller who rushes along and crams us with names. Entering Spain by its eastern wicket, the picturesque possibilities are developed of Gerona, Barcelona, Montserrat, Monresa, Lerida, Zaragoza, Tarragona, Poblet, Valencia, and Saguntum, few names in all, and in a mere corner and strip of the land. But the developing is well done. The towns open before us with separate and living personalities. The crowds or the solitudes in the streets, the churches and ruins are clear and distinct. With it all, too, goes the haze of illusion which is of Mr. Wood's art. He believes in human interest in his pictures and supplies it richly. Across his stage come priests, several of them—he confesses to a weakness for priests—and they are usually good; at least one bishop, who is hypnotized into a long history of himself, almost the only dull one in the book; a nun with a romantic tale; a bootblack of aristocratic descent, who, unlike the needy knife-grinder, has a story to tell us; a watchman; a veiled and mysterious lady, who begs and who also has a weakness for wine—this is managed well; a monk musician, or rather two of them, one of romantic presence after the fashion of the "Annuals," the other, an excellent other, dropped from pure romance—a hunchback playing Schumann, Bach, and Beethoven in an empty cathedral at midnight, by the light of a solitary candle; a most romantic old Canon—but who could not make romance out of a Canon of Spain with an old housekeeper who calls him "Canonigo"?—who lives in the most wonderful Dutch interior of a house, with copper pans and old oak carving (Mr. Wood has a knack for interiors); an architecturally inclined sacristan and his son; and, above all, donkeys—a wilderness of donkeys. Towards priests and donkeys lies Mr. Wood's penchant, and the donkeys are better than the priests. It is true that none is equal to Sterne's Ass—alone worthy of the capital, the only worthy ass in literature since those of Balaam and Sancho Panza; but one here, especially, which could appreciate the joke of being beaten, is full of excellent humors.

And the art in it all, if somewhat artificial and in need of concealment, is undoubtedly great. These figures are never allowed to obscure the stage on which they move. The towns, with their varying atmospheres and associations, are made more real by their presence and never overshadowed, as in some less careful progresses which we have seen of late. Mr. Wood keeps his puppets in order, and they go back to their box obediently when need is. In this he is much aided by the illustrations. However they are produced, and whatever is their ultimate basis, they are of singular beauty, and, what illustrations seldom do, they illustrate. But little separates some of them from the exquisite steel engravings which were the glory of the old-fashioned "Annuals" and which makes them still a prize for the collector. Only on two points would we entreat Mr. Wood to reconsider his method—it will be but to slip some cogs or levers in the machine: let us have less of the vapid sentimentalities of the "Annuals" and of Chateaubriand, and more of the solider humor of Sterne and Longfellow; and let him pose less as an inspirer of mysterious confidences from all sorts and conditions of men. The effect is always a strain, and it produces, in the end, artificiality to the point of absurdity. The ingenuity otherwise in his book is so great that he can surely accomplish this.

Finally, if it may seem to Mr. Wood that we have written of his book too trivially or flippantly, let him believe that it has been read with pleasure, and is now cordially commended for its refreshing novelty and graphic vivacity.

Camera Shots at Big Game. By A. G. Wallihan. Doubleday, Page & Co.

In this, as in a former book, 'Hoofs, Claws, and Antlers,' Mr. Wallihan has presented to the world the finest photographs ever taken of large wild mammals in their native haunts. On the present occasion his hunting ranges were in northwestern Colorado and western Wyoming, and his pictures include black-tailed deer, elk, antelope, mountain sheep, coyote, black bear, wild cat, and mountain lion. He caught his subjects fording, swimming, drinking, standing alert for danger, crouching at bay, grouped by hundreds, and posed singly for a portrait study. His skill and patient industry under difficult conditions are noteworthy. He says in his preface:

"The pictures have been made in the

open country, outwitting the far-seeing antelope, or by riversides, while the author waited with bated breath the near approach of a bunch of deer. Again, the work has been done in the mountains where the fawns lay hidden, their mothers bounding away upon approach, where the fat bucks sought the shelter of the oak brush or lay out in a point of aspens that the sun might harden their horns, . . . or following the hounds in winter on the trail of a cougar over the hills and cañons of White River, or on into the bleak, wind-swept ranges of Wyoming, matching skill with the big-horn or the lordly elk."

His most thrilling "camera shots" were taken at mountain lions. Hunters treed the beasts with hounds, and then he used an eight-by-ten camera with wonderful success. In one case he caught a lioness in mid air, springing from a tree so near that she struck the ground within six feet of him.

The book contains an introduction by Theodore Roosevelt, which concludes thus:

"More and more, as it becomes necessary to preserve the game, let us hope that the camera will largely supplant the rifle. It is an excellent thing to have a nation proficient in marksmanship, and it is highly undesirable that the rifle should be wholly laid by. But the shot is, after all, only a small part of the free life of the wilderness. The chief attractions lie in the physical hardihood for which the life calls, the sense of limitless freedom which it brings, and the remoteness and wild charm and beauty of primitive nature. All of this we get exactly as much in hunting with the camera as in hunting with the rifle; and, of the two, the former is the kind of sport which calls for the higher degree of skill, patience, resolution, and knowledge of the life history of the animal sought."

The publishers have handled the illustrations unfortunately, inserting them at haphazard, and omitting several that are referred to in the text.

A NOTABLE NEW BOOK

Harkness & Forbes's Cæsar's Gallic War . $1.25

With introduction, notes, and vocabulary. By ALFRED HARKNESS, Ph.D., LL.D., Professor Emeritus, Brown University, assisted by Charles H. Forbes, A.B., Professor of Latin, Phillips Academy, Andover, Mass.

While remarkable for its simplicity, this book contains everything needed by the student in reading the Commentaries. The introduction contains an outline of the life of Cæsar, a description in brief of the scenes of his military operations, and a short treatise on the military system of the Romans. The notes, while sufficiently helpful, do not invade the province of the living teacher. The illustrations are entirely appropriate and unlike those in other works of a similar nature.

426 and 428 West Broadway, New York

THE SOCIAL EVIL.

With Special Reference to Conditions Existing in the City of New York. A Report Prepared Under the Direction of the Committee of Fifteen. *12mo. Net, $1.25.* (*By mail, $1.40.*)

A careful study of conditions and of the remedies attempted in European cities, together with suggestions for remedying the evil.

The Commercial Advertiser:

"What other great cities of the world have done to restrict and regulate this evil is set forth with a completeness not to be found in any other single publication, and the whole question is treated in a thoroughly scientific and dispassionate manner worthy of the highest praise."

The Evening Post:

"If the Committee of Fifteen had done nothing else, the remarkable study of the social evil and the various methods of combating it would entitle its membership to the warm thanks of the citizens of New York City. It was most proper that the extremely valuable results of its investigation should be put in lasting form."

G. P. PUTNAM'S SONS, New York and London

JUST READY VOLUME IV. *COMPLETING*

The Cyclopedia of American Horticulture

Edited by **L. H. BAILEY**, assisted by
WILHELM MILLER and many expert Cultivators and Botanists.

In four 8vo volumes. Bound in cloth, $20 *net;* half morocco, $32 *net.*
2,000 pages, with 2,800 illustrations.

In this great Cyclopedia will be found a complete description of all species of fruits, vegetables, flowers and ornamental plants in America; directions for the cultivation of all kinds of crops, observations on marketing, etc., the whole superbly illustrated.

The work is sold by subscription only; for Circulars and full information as to terms by monthly payments, etc., address the publishers.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 27, 1902.

The Week.

Very ungraciously, and with many ifs and buts, the Republican members of the Ways and Means Committee have at last agreed on a proposal for Cuban reciprocity. The details of it are grudging and unsatisfactory; but they are scarcely worth stopping over now, since every one knows that the measure will receive its final form in the Senate. The great thing is to have driven the small and small-minded junta in control of the business of the House to admit that we are morally bound to grant Cuba tariff reductions. Rates and time of going into effect will be determined later and elsewhere; to have made the reluctant and timid Committee go so far as it has in defying its protectionist tyrants, is triumph enough for the day. The victory is really Mr. Roosevelt's, who has shown the astonished Congressmen what a President can do who, when he says "plain duty," means it, and sticks to it, and drives it home to the consciences of others.

Several of the Senators who hate civil-service reform as the devil does holy water, took occasion of the debate on the Census Bill to free their bosoms of long-pent woes on that subject. Senator Stewart came out strong on the intolerable "mystery" and "secrecy" of the civil-service examinations. How men passed them, why they were then appointed to office, offered painful difficulties to his brooding mind. Just let Senators and Representatives have all the appointments, and see how plain and above-board the whole thing would be—no intrigues, no whisperings, no back-door bargainings, but simple merit coming to its own! As for Senator Gallinger, he took up again his ancient and bitter parable. Civil servants protected in their offices by law were to him the one unclean thing in politics. Why, there are clerks in the departments, credited to New Hampshire, who do not "go home to vote"! Worse than that, they "do not contribute for political purposes"! Of course, to the Gallinger intellect, it is clear that "there ought to be some way of weeding them out." But, for a real Tammany outburst, commend us to the cry of Senator Scott against what he called "civil service," to which, he said, he "was opposed from the beginning." "It will soon be," he shouted, "that we will [shall] not need the service of Congress at all. The Civil-Service Commissioners will be the people who will run this country." Such was the animus, half ignorance, half malice, of the men who aimed a blow at civil-service reform in the Census Bill, which President Roosevelt is under the highest obligation to nullify.

Senator Tillman richly deserves expulsion for his passionate assault upon his colleague, Senator McLaurin, in open session of the Senate, but apparently some way will be found, short of that, to "purge" him of contempt and restore him to good standing in the "most august assembly on earth." No provocation can excuse so gross a breach of the rules of the Senate, to say nothing of the manners of a gentleman. The South Carolinian's antecedents, with the fierce methods so long used by him in fighting his way to the front in his own State, have evidently made him quite too ready both with tongue and fist. It must be admitted—and in saying this we are only following the opinion of some of the best Republican Senators—that Mr. Tillman has greatly improved since coming to Washington, and, in many ways, has given promise of becoming a useful legislator; but so long as he is still subject to such bursts of ferocity, his place is obviously not in the Senate of the United States. We have seen in that body too many representatives of the half-horse, half-alligator type to expect perfect courtesy from all its members; but open brawling, with bloody noses and blackened eyes, is scarcely the kind of thing the Senate would like to exhibit to Prince Henry as a sample of the manners of our statesmen.

The President has now spoken the last official word in the Schley controversy, and his decision is a happy mixture of sound judgment and shrewdness. He brought to his task a fresh mind and a practised power of expression. The skill of the literary man surely stood him in good stead when he wrote that the present appeal to him was "in effect an appeal from the action of President McKinley," and when he announced his own finding to be that "President McKinley did substantial justice" in recognizing Sampson as commander-in-chief at Santiago, and in recommending for him a greater advance than for Schley. Can you be sure that you are not an anarchist if you object to such a verdict? Equally ingenious is Mr. Roosevelt's review of the actual course of the battle. He had to intervene in an angry dispute as to which one of two men was the "hero" of the fight. His answer is "Neither: it was a captain's fight." Mr. Roosevelt has the air of putting aside as of small account the findings of the Board of Inquiry in regard to matters occurring before the battle. The appeal to him was on other points. Moreover, he remarks that Schley's offences had been technically "condoned." Yet we do not expect the Schley partisans to glory excessively in this part of the President's memorandum. It is really an approval of the grave charges made against Schley in his conduct of the preliminary operations. As to all of them President Roosevelt quietly remarks, "I am satisfied that on the whole the Court did substantial justice." That is to say, he agrees with it in thinking that Admiral Schley was guilty of terrible lapses as an officer, and of conduct unbecoming a gentleman. To say that these "offences" were "condoned" is cold comfort for a popular hero *sans reproche*.

The Supreme Court has decided, in the action brought by Gov. Van Sant in behalf of the State of Minnesota to prevent the merging of the Northern Pacific and Great Northern Companies, that it has no jurisdiction, and that the bill of complaint cannot be amended so as to confer jurisdiction. Therefore, the case drops without any indication of an opinion touching the main controversy involved in the merger. The essence of the controversy is whether the merger is in the nature of a monopoly, which the law of the land, both State and Federal, aims to prevent. Monday's decision was of a technical nature, interesting to lawyers, indeed, but not to the public in general.

The announcement is made from Washington, by the Attorney-General himself, that a suit will shortly be begun by him to test the legality of the merger of the Northern Pacific and Great Northern Railway Companies. Further, that the President requested his opinion as to the legality of the merger, and that he had recently given his opinion that it violates the provisions of the Sherman Anti-Trust Act of 1890, whereupon the President directed that he take suitable action to test the question judicially. In so doing, the President is, of course, moved by something more than mere curiosity as to the legal bearings of a new form of corporate enterprise. In the course of argument in the case brought by the Attorney-General of Minnesota against the merger, one of the judges asked the learned counsel of the Northern Securities Company whether there was any reason why the system of merging might not be carried on till all the railroads in the United States were consolidated. The reply was that no such reason existed in the mind of the counsel, but that he thought it very unlikely that merging would ever be carried to such an extreme. That colloquy probably

had its influence in deciding the President to take some step to show that the Republican party is not altogether remiss, as has been charged by leading Democrats, in using such powers as the law has supplied for curbing the Trusts and combines which have so greatly multiplied of late. Thus politics is at the bottom of the suit which the Attorney-General has announced his intention to begin, but it is politics in the wide sense of the nation's purpose to find out where it stands in reference to these huge aggregations of capital, which seem to menace the orderly and customary progress of industry and social growth.

The Anti-Trust Act, under which the Attorney-General will proceed, was passed by Congress in 1890. It declares that every contract or combination, in the form of Trust or otherwise, in restraint of trade or commerce among the several States or with foreign nations is illegal, and may be proceeded against in the courts of the United States by the district attorneys, under the direction of the Attorney-General, for the purpose of restraining, preventing, and prohibiting violations of the act. The question to be considered by the court, therefore, is whether the Northern Securities Company is a contract or combination in restraint of trade or commerce among the several States. Of course, this point was duly considered by the legal advisers of the company before the merger was agreed upon. They contend that the holders of the shares of the Northern Pacific and Great Northern Companies have the right to put their holdings in a safe-deposit box or common receptacle, under an agreed custodian, and that no court can disturb them in such ownership and disposition of their shares. They say that the only difference between such custody and that of a corporate holding like the Northern Securities Company is that, in the former case, the death of the holders would release the securities and dissolve the agreement, whereas in the latter no such mishap would occur. The vital difference, therefore, is that in the one case the agreement is temporary, and in the other it is or may be perpetual. In its essence it is the difference between ordinary holding and mortmain, which, as lawyers know, is a material difference.

A little second thought will, we think, convince even the Wall Street interests which were put so much out of countenance on Thursday, that the Administration's movement to test the Northern Securities combination is desirable. The plain facts are that a company with $400,000,000 capital is on the eve of beginning business and distributing its shares to investors; and that a severe prohibitory law exists which may or may not cover this organization. On this second point eminent lawyers are known to differ, and no final decision can be had outside the Federal courts. Considering the consequences that might ensue were the test to be applied when the company had been long in active operation, and when, presumably, a number of other companies had been organized on similar lines, it would seem that the question could not be pushed to a settlement too soon. This we believe to be the feeling of lawyers generally, and it is certainly the feeling of the thoughtful public. The people at large, in fact, have a further stake in such a judicial test. The Northern Securities project may be beneficial and innocuous. But it is not denied that the theoretical powers under that charter, in the line of possible control over competition, are all but unlimited. This being so, the very same corporate device may conceivably be used, at any time, by promoters whose purposes would be both dangerous and harmful.

Secretary Hay's formal protest against the secret convention between China and Russia is a diplomatic move of the first importance. Forwarded on the 1st of February, although first published on Thursday last by the *Sun*, it anticipated by some days the publication of the Anglo-Japanese alliance, the moral effect of which it undoubtedly strengthens. Secretary Hay has an interest of a very personal sort in this negotiation, for it was his initiative and patience which, in the spring of 1900, gained assurances from all the Powers, including Russia, that the open door would be maintained in China. The correspondence, which was chiefly concerned with foreign "spheres of influence" and leased territory in the Chinese Empire, is now of exceptional interest, since Russia principally was affected by this international agreement. Secretary Hay, beyond uniform tariff regulations, desired assurances that it was not the purpose of Russia "to interfere with other nations, and that our citizens would continue to enjoy within said leased territory all the rights and privileges guaranteed them under existing treaties with China." It is interesting, in view of subsequent events, to recall that Mr. Hay named to the Russian Foreign Office, as the first Powers which had fallen in with the American proposal, the future allies England and Japan. Count Muravieff met Secretary Hay's note of September 6, 1899, very squarely in the matter of tariffs; in the matter of general commercial concessions the Russian Foreign Minister merely said that, in the territory (read Mantchuria) which lay beyond the districts already leased to Russia, "the Imperial Government had no intention whatever of claiming any privileges for its own subjects, to the exclusion of other foreigners." This assurance is Secretary Hay's warrant for protesting against the exclusive concession of railway and mining rights in Mantchuria to Russian companies. His intention is not primarily political, but commercial.

Gov. Taft concluded on Thursday his testimony before the Senate Committee regarding the situation in the Philippines. His appearance at the national capital has been a great disappointment to those who welcomed his coming as that of an almost omniscient being, whose views as to the proper policy of our Government would command universal acceptance. Practically all that he has said may be reduced to this, that he and his associate Commissioners, and other Americans who may be sent, from time to time, to the Philippines, must be trusted to govern the islands as they think best; and that it is not only impertinent, but intolerable, that anybody here should criticise anything they may do, or, indeed, talk about the matter in any way, since any talk is pretty sure to do harm. Gov. Taft has been a judge of high reputation, but he knows little about the American character if he supposes that such Imperialistic rule will be sanctioned by the people. The truth is, that the feeling in this country in favor of giving the Filipinos their independence is now decidedly stronger than it was before the Governor began testifying, and the Anti-Imperialists are much indebted to him for the stimulus which he has given their cause.

Like Gov. Taft's statement to the Philippine Committee, Secretary Root's letter to Senator Lodge in defence of the army admits that there have been many cases of sporadic ill-treatment of Filipinos by American soldiers. This is all that has ever been charged by the critics of the war in the Philippines. It was quite unnecessary for Mr. Root, or any one else, to show that the orders to the army have always been against the practice of cruelties or barbarous methods of warfare. The rules of war have long laid down certain actions, such as the poisoning of wells, the shooting down of prisoners, etc., as beyond the pale of civilized warfare. The military authorities in every country inform their troops upon these points, but whether the under officers and the soldiers live up to their orders depends entirely upon the discipline of each army. According to Secretary Root, some forty-four officers, soldiers, and camp-followers have so far been tried for illegal actions, and of these no less than thirty-nine have been convicted. How many more have gone undetected cannot even be estimated. Unfortunately, the nature of the country, the fact that it is against "niggers" that our troops are fighting, and their frequently being split up into detachments of five

or ten without an officer, allow many an opportunity for misbehavior which is never heard of by the high officials. That there is very grave provocation in the undoubted cruelty and misbehavior of the Filipinos, the Secretary asserts, and no one will deny; but no misconduct on the part of the owners of the Philippines will excuse the American soldier who lowers himself to their level.

The American Newspaper Publishers' Association, at its annual meeting on Thursday, passed the subjoined resolution:

"Resolved, That the American Newspaper Publishers' Association ask Congress to abolish the duty on wood pulp, mechanical ground wood, and lumber used in the manufacture of paper, and that the duty on news print paper be reduced."

This resolution expresses, we think, the unanimous wish of the press of the United States, and is, in itself, a reasonable proposition. The material for the manufacture of wood pulp (spruce logs) is becoming scarce, so that, under the normal relations of supply and demand, the price of paper must rise. The very scarcity of the material favors a combination of the paper manufacturers. As soon as the latter can control the supply, they can advance the price, and may be forced to do so, even against their will. The publishers, as a general rule, cannot advance the price of their newspapers without incurring great risks. A one-cent newspaper, for example, cannot raise its price to two cents without danger of losing the bulk of its circulation, yet a small advance in the price of white paper may make it impossible to sell at one cent per copy without loss. The entire press of the country is facing the problem of an advance in the price of its raw material, which will come soon, unless the supply of wood pulp can be increased.

No such increase of supply is possible except from foreign countries. Canada and Norway have large forests of the kind of timber suitable for wood pulp, and are able to produce pulp itself cheaper than it can be made here. Under the Dingley tariff, logs and blocks of wood for the manufacture of pulp are admitted free, but wood pulp, if bleached, is subjected to a duty of one-quarter cent per pound, dry weight. The rate for unbleached pulp produced by the mechanical process is one-twelfth cent, and by chemical process one-sixth cent, per pound. The duty on print papaper is three-tenths cent per pound. There is a senseless provision in the law that, if any country shall impose an export duty on pulp wood, an equivalent amount shall be levied as an additional duty on wood pulp imported from such country. This provision, foolish in any case, is especially so in the case of a country which has an insufficient supply of the article in question. The export duty puts an obstacle in the way of the importing country which is seeking an additional supply. The countervailing duty doubles the obstacle, without any gain to anybody. The tariff combine will resist the change, not because the duty on wood pulp is of any particular consequence, but lest the opening of any crevice in the wall shall lead to wider breach. For the same reason that Mr. McKinley's reciprocity treaties were throttled, the movement for free wood pulp will be resisted and defeated unless the newspapers solemnly teli their Congressmen that they will oppose the renomination and reëlection of every one who votes against the measure. The Illinois Press Association seems to have reached this determination. Nothing short of this will be of any effect.

Prince Charming himself could not have made happier first impressions than has Henry of Prussia. A right democratic prince, with a true sailor's affability and frank address, he has shown an intuitive perception of the real nature of his mission. This is simply that of the bearer of cordial greetings from one great nation to another. Mystified foreign observers will not believe this, and even in England the notion seems to be held that the Prince may quietly make a treaty with President Roosevelt of a sort to revolutionize international relations. Saying nothing of the ludicrous misunderstanding involved in this, it shows how incredible it is to a certain order of intellect that trouble should be taken in the name of plain friendship. But it is purely as a friend that the Prince comes, and only as such that he gets his hearty welcome. And, come to think of it, this is really better and more significant than any treaty or alliance. Instinctive sympathies and spontaneous good will cannot be reduced to writing or put into a binding contract; but when they exist, as they now do between Germany and the United States, everything which serves to emphasize and heighten them, as does Prince Henry's visit, is an event to make glad the hearts of all lovers of peace.

Lord Rosebery's final announcement of his purpose to set up for himself, in opposition to Campbell-Bannerman and the bulk of the Liberal party, has an unfortunate appearance of being a step to which he was goaded by his critics and importuned by his friends, rather than led by his own courage and instinct of leadership. During the weeks since his Chesterfield speech, he has been letting I dare not wait upon I would, apparently hoping that the Liberal party would gravitate his way. Now that he has found the party organization still indisposed to throw over Irish home rule, and not inclined to adopt his views of the Boer war, he reads himself out, more in mortification than in boldness. He will doubtless form a Liberal "cave" for the present, but the real question is what he will do next. Some think his aim will be to detach the Liberal Unionists from the Conservatives. But this will be difficult. Joseph Chamberlain will have something to say about that, and he is a politician far more astute than Rosebery, besides possessing a daring and adroitness to which that nobleman can lay no claim. And Chamberlain has already gone out of his way to show that he will have neither part nor lot with Rosebery. The latter's idea of peace proposals he called "wild and whirling words," and he even gibed in the Commons at one of Rosebery's catchwords—"that great and glorious word, efficiency," he said, mockingly. Rosebery is young, as English statesmen go, and may hope to live long enough to be Prime Minister again, at the head of some party or other; but the immediate effect of his action can only be to make him a more impossible Liberal leader than ever.

Spain has known little but political and industrial upheavals since 1898, yet the present troubles in Catalonia, which seem to be expected to spread to other parts of the kingdom, appear more threatening than anything that has gone before. Radicals and Socialists, with leanings towards anarchy, have long swarmed in Barcelona, but why, on account of their fierce outbreaks, should the Government be thinking of declaring martial law over the whole of Spain? This grave and even panicky view of the situation would argue that the discontent which so many observers of Spanish affairs have been reporting is more widespread and deep-seated than was suspected. Taxation, as usual, is at the root of one great popular grievance. The food tax, known as the *consumo*, which is levied on all food (except bread) entering towns, has been a cause of general dissatisfaction and outcry. This tax yields for the national Treasury about $13,000,000, and for the municipalities something like $10,000,000 in addition. The municipal rate varies, though the Treasury portion is fixed, so that the tax rests more heavily upon some cities than upon others. On wine, for example, the *consumo* tax in Barcelona is said to be over 400 per cent. on the original cost, while in Madrid it is about 200. Taxes so grievous and unequal seem as if ingeniously devised to provoke a revolt. When we reckon in the industrial depression in the manufacturing provinces, the anarchistic propaganda pushed partly by a foreign element, the general instability of the Government, and the *malaise* of the country, it is not, perhaps, surprising that we hear of such extensive disturbances in the Peninsula.

MR. ROOSEVELT'S FIRST VETO.

President Roosevelt has not yet vetoed—but can there be any doubt that he will veto, when it reaches him?—the bill (H. R. 10,308) to "provide for a permanent census office." A permanent census office may be desirable, but no bill establishing it which incidentally aims a deadly blow at the merit system should receive the signature of Theodore Roosevelt. Exactly that is what the bill does. By providing that all the clerks now employed in the Census Office shall be taken into the classified service, it proposes to foist a thousand or twelve hundred Congressional protégés into offices which, under the civil-service rules, would go to the persons who, by test of open competition, have won their way to the head of the eligible lists. It is, in short, a flagrant attempt to "beat" and discredit civil-service reform. But that means, of course, that it is also an attempt to discredit President Roosevelt; and he, convinced and committed civil-service reformer that he is, will know how to fling back the insult in the teeth of the spoilsmen who offer it to him.

There is no concealment about the nature of the bill. Its demoralizing aim was clearly pointed out in both House and Senate by the handful of genuine civil-service reformers to be found in either. Representative Moody indignantly denounced the job. Senator Lodge, with no flaming zeal, explained its vicious tendency. The case stands as follows: There are some 2,298 persons at present employed in the Census Office. About 800 are to be retained in the permanent census. The temporary employees number 145, and they will be dropped. There remain, therefore, fully 1,200 employees who, by the bill, are to be carried over to the classified service. Now what does that mean? It means that these clerks, without examination, are to be put over the heads of those who have passed the civil-service examinations and are on the eligible lists waiting to be certified, as the law directs, to the first vacancies that may occur in the Government departments. If you are "in the classified service," though unemployed, you are entitled to a "transfer" to any office falling vacant, with preference over a candidate merely on the eligible list. But who are these specially favored individuals? Why, they are Congressional appointees, thrust upon the Director of the Census by political influence, and now smuggled into the classified service by the back-door of tricky legislation. There was no disguise about the business. In either house the bill was put through amidst jeers at civil-service reform—"this so-called civil-service reform," was Senator Gallinger's taunt—and in a hilarious and unblushing revel of the spoilsmen.

The bill has gone to conference, but if it comes to the President with this nefarious assault upon civil-service reform still included in it, Mr. Roosevelt is bound to veto it. He has some regard for his own consistency, if Congressmen have none for theirs. If there is anything for which he stands in public life, it is for an impartial and unflinching maintenance of the merit system. The man who made so heroic a fight at Albany to get "the starch" put back into the State civil-service laws, is not going to sit idly by and let Congress make the national civil-service laws look as limp as one of Gov. Black's starchless collars on a muggy day in July. The President is under obligation to see that good faith is kept with those who, all over the country, have accepted the Government's invitation and taken the civil-service examinations. The tacit, the well-nigh explicit promise to these successful persons at the head of the eligible lists is that they shall be certified to the 600 or 700 vacancies occurring every year. But now a swinish Congress steps in to put over their heads enough unexamined favorites to fill all the vacancies for two years. Meanwhile, the eligible list is good only for a year, and the result would be, not only to deprive those on it of their implied right to appointment, but to force them to take their examinations over again, if they still desired to take service under a Government capable of so gross an injustice to them.

This is the spoilsman's game, the politician's double-dealing, which President Roosevelt is bound to block. None of the ordinary reasons against vetoing an important bill apply in this case. It is not the end of a session. The bill can be revived in decent form and made law. And the argument of the expediency of not offending Congressmen with whom the President has to cooperate, is not one which we should advise any one to address to Mr. Roosevelt when it is so clear a case of right and wrong. He would simply take down a copy of his 'Strenuous Life' and read to the tempter a few ringing sentences: "There are certain subjects on which no man can compromise." For Theodore Roosevelt, civil-service reform is one of them. "When a man in public life pledges himself to a certain course of action, he shall, as a matter of course, do what he said he would do, and shall not be held to have acted honorably if he does otherwise." By word and deed President Roosevelt is pledged up to the hilt to withstand all such attacks upon the merit system as that which the census bill carries with it, and we are therefore confident that he will courageously meet those enemies of his, and of reform, and let them feel the weight of his veto.

It is a critical hour for the whole reform. The demoralization under President McKinley was insidious and pervasive. This latest cynical attempt to make a mockery of the civil-service laws is the natural result. The clerks were put into the Census Office as so much spoils, and the excuse was given that their employment was special and temporary. Now we see the whole body of them shoved into the classified service. If the President consents to this breach in the defences, soon the whole fortress will be swarming with spoilsmen, and civil-service reform will be made an end of. The time is ripe for a bold and vigorous and conscientious reformer like the President to call a halt. A smashing veto message now would do more for the cause than all the insincere political platforms in the world. It is as if the President's enemies in Congress had determined to challenge his metal. Prince Henry has been reading 'American Ideals'; no finer spectacle could the President offer him of the ideal in action, of civic courage leaping to the defence of principle, than that of withstanding single-handed the rush of the embattled spoilsmen, and taking his stand, as he does in *Life's* cartoon last week, upon civil-service reform, with the cry, "This rock shall fly from its firm base as soon as I."

HUMILIATING THE HOUSE.

"You must know what privileges you have. Not to speak every one what he listeth, or what cometh into his brain. But your privilege is 'Aye' or 'No.'"

Such was the language of a Lord Keeper of the Great Seal, in the Tudor days, to the House of Commons. It would be regarded now as an absolute suppression of the liberties of the Commons of England. Yet we have lived to see that lusty child of the Mother of Parliaments, the House of Representatives of the United States, held down to the bare privilege of voting "Aye" or "No," with scarce a murmur heard. Its haughty Keeper of the Great Seal is no Tudor courtier, but its own Committee on Rules. That body reported a "rule" last week that the pending bill for the repeal of war taxes should be voted on without amendment. A perfunctory debate was to be allowed—though this was cut off by Representative Richardson's motion to proceed at once to voting, since, as he asked, "If we are really gagged, why should we try to talk?"—but any amendment, large or small, was to be immediately declared out of order. There could not well be a rougher way of reminding the House to what a vanishing point its old privileges have been whittled.

Yet another such rule, it is said, is to be put in force when the bill for the relief of Cuba is laid before the House. Members will be allowed to speak their minds about that measure and to vote for or against it; but will not be permitted to change it, to improve it, in any particular. Evidently automata would, under such circumstances, serve as well as living men, with brains and voices,

in the capacity of Representatives. The Committee on Rules could then, a little more conveniently than now, press a button, and let the roll-call do the rest. One has only to look to the other end of the Capitol to see the contrast between such slavish methods and the old tradition of free discussion and untrammelled decision. The Senate passed the Philippine Tariff Bill on Monday. Debate had been perfectly free; the right of offering amendments was unrestricted. Many amendments were, in fact, offered. Some of them were adopted, others voted down; but the sense of the Senate was fairly taken.

That is the fundamental objection to this new style of putting manacles on the House: it defeats the great end of every deliberative assembly—namely, to ascertain "the sense of the meeting." The leaders of the House refuse to take the sense of the House. They devise a rule, rather, to prevent that sense from obtaining expression. No one can doubt, for example, that the Babcock bill for putting iron and steel on the free list would have commanded a majority in the House, if the House had been allowed to vote on it. As an amendment to the bill repealing war taxes, it would have been perfectly germane. Many Representatives were eager to offer it as such; more than a majority were ready to vote for it. But no, said the Lord Keepers of the Committee on Rules, all you can do is to say "Aye" or "No" when the bill is put on its passage, and all your amendments will go out on a point of order. That marks the depth of humiliation to which the House has been brought.

We know it is said that the House did not need to adopt the obnoxious rule. It could have refused to sanction the proposal of the Speaker and his satellites of the Committee on Rules. Messrs. Henderson and Dalzell humbly profess to be "the servants of the House," and will allege that, if it wears any fetters, they are self-imposed. This has a technical plausibility, but does not go to the heart of the case. If the House had rejected the rule, then the bill would not have been called up at all. The Committee knew that both sides of the House were desirous of passing a bill of some sort. It practically said to the members, "Very well; take the bill exactly as we present it, without the change of a letter or a comma, or else you will not get it at all." It may be said that the House had still a remedy. It could have elected a new Speaker, and thus got a new Committee on Rules. But that would have been practically a revolution; and it was upon its impossibility that the Committee cunningly counted when it asked the House to cut itself off from the power of amendment. The only alternative was to revolutionize the organization of the House. It is substantially true, therefore, that the creatures of the House have devised a scheme to make the House impotent.

Speaker Henderson, in that pitifully weak letter of his to an Iowa constituent, innocently revealed another way in which the House, under his leadership, is sinking into discredit. Speaking of tariff revision, of which he said that, as respects "a few schedules, like steel and glass, I would [should] like to see it done," he remarked:

> "You may not be aware that under the rules of the House we would [should] be able, undoubtedly, to pass a bill that might touch a very few items, putting some on the free list or reducing; but while, under the rules of the House, this might be accomplished, the Senate has no such rules, and there it would probably broaden out into a general revision of the tariff. That all of us dread and fear."

There it is again: the sense of the House must not be taken. Representatives cannot speak their wish and work their will, lest, if they do, something happen elsewhere. The House is to live in terror of the Senate. The House has "rules," to act like bit and bridle, but the lawless Senate may actually do what the majority of its members desire! That is the spectacle which frightens Speaker Henderson. He has so long been accustomed to voting to order, and only on questions which the Committee on Rules deems it wise to let the House consider, that the thought of open discussion and free voting fills him with alarm.

It is clear, however, that it is only a bogey at which he is terrified. The Senate *has* its rules. The majority of the Senate *can* have its way. This we have seen again in the case of the Philippine Tariff Bill. If the Republican Senators were in earnest, they could effect that tariff revision which Speaker Henderson affirms to be so desirable but so impossible. Every one knows this. And every one knows, also, that what the Speaker and his protectionist mentors are afraid of is, that the thing will get out of hand if brought up at all. They know that a Republican revolt is muttering in the West, and they fear that many Republican votes would be found united to Democratic if a tariff revision bill could be got squarely before the House. So they go about to deny the House the right to vote at all on tariff revision, apparently unconscious that they are thus humiliating the House which they profess to honor, and doing all in their power to enhance the dignity and importance of the Senate, which they profess to dread. If any one inquires why it is that the Senate has so greatly risen in popular esteem during the past ten years, while the House has sunk, the true answer will point to those timid and narrow-minded leaders of the House who have been so successful in making it a contemptible second in all great matters of national legislation.

A NEW SCHEME TO AVOID LABOR TROUBLES.

There has never been a time when any scheme for securing better relations between capital and labor, and especially for avoiding a recourse to strikes and lockouts, was so sure of sympathetic attention as now. The public has grown weary of the suffering inflicted upon it, as well as upon the parties immediately concerned, when differences end in bitter controversies, and has become convinced that there must be some better way of settling such disputes than by fights. Hopeful progress is now making with a plan for establishing a central court of settlement and appeal for employers and employees in the various building trades of New York city. There are dozens of these trades—carpenters, masons, iron-workers, stone-workers, plumbers, plasterers, and so on; indeed, the outsider must be surprised to learn how many different kinds of occupation there are which have to do, in one way or another, with building operations. The number of employers reaches high into the thousands, and there are scores of thousands of workmen. The establishment of any system which would secure peace and harmony in this great army would consequently be an event of the first importance in the industrial world.

Perhaps the most serious obstacle to the securing and maintenance of the right relations has been the lack of any machinery for preventing a difference from ending in a strike before an attempt at arbitration is made. The employees "get mad" and stop work, or the employers say that they "can't stand such nonsense," and order a lockout; each side feels indignant at the other, and does not want to be the first to back down; if arbitration is proposed, it is hard to agree upon terms and to secure the proper referees, and the controversy drags on for weeks, quite likely to end in no material gain for the party which precipitated the trouble.

The fundamental feature of the present scheme is the establishment of a permanent body for the settlement of all questions as they arise—a body constituted when both sides are cool, and considering issues submitted by people who still remain cool. This "central court of settlement and appeal" is to have three salaried members, chosen for a term of not less than three years, who will be the nucleus of a larger body of nine men, six of whom will be constantly shifting. One of the central three is to be chosen by the workmen in the various building trades, acting through a committee; the second by the employers, acting in the same fashion; and the third by these two. It is hoped and expected that men of good ability and high standing will be secured for these positions, as their work would seem attractive and their pay would be

liberal. On a question being raised in any trade—as, for example, the painters'—the three permanent members of the court would be reinforced by three men representing the employers and three representing the employees in this trade, making nine in all. These six temporary members would bring expert knowledge of the special conditions affecting their trade to supplement the grasp of general principles affecting all trades possessed by the three who sit permanently. The nine would decide, say, the terms on which the employing painters and their employees should work for the coming year, and then these six temporary members would withdraw, to be replaced by six representing the carpenters, six who should act for the plasterers, and so on. When all trades have thus been through the court, announcement will be made of every agreement that has been reached, and these agreements will be the rule by which all who have to do with building operations, as employers and employed, are to be governed for the next twelvemonth.

Should any controversy arise as to whether either side in any trade is living up to the agreement, recourse would at once be had to the court. If, for instance, the steam-fitters should think they had a grievance against their employers, their three special representatives, with the three representing their employers, would join the standing three, and the nine would render their decision after hearing all the evidence and considering the merits of the case. Meanwhile the employers in every trade would be pledged not to order a lockout and the workmen not to order a strike, so that the development of a controversy need cause no interruption of work or inconvenience to the public.

The proposed court would have no legal authority. It would depend solely upon moral influence for the execution of its decrees. But it is believed that a hearty acceptance of the scheme by both sides in all of the many trades would give such weight to any decision of the body that neither side to a dispute submitted to it would challenge the odium involved in repudiating its authority. The development of the plan was intrusted, some months ago, to Mr. William H. Sayward, a well-known practical builder and public-spirited citizen of Boston, who organized the National Association of Builders, of which he is now the Secretary. He has had experience in such work as he is now doing, having devised a system of working relations between employers and employees in the building trades of Boston which has prevented any strikes in those trades for a number of years. He has presented the scheme to nearly all of the many employers' associations, and in every case has secured their cordial approval. It is now being submitted formally to all the labor unions in the various trades; and as many of their leaders have individually endorsed the idea, it is hoped that these bodies will also accept it. In that case it should be possible to put it in operation during the present year.

It would be over-sanguine to expect that any plan will immediately put an end to all troubles in any trade, and especially in so large a group of trades as is here involved. But there is warrant for great encouragement that a scheme which appears so reasonable and practicable should have been devised, and that so much progress should have been made toward carrying it out. This progress is in itself a sign that public opinion is enforcing its growing demand that industrial war must cease.

THE SHIP-SUBSIDY SCHEME.

The new Ship-Subsidy Bill is made up of two distinct parts, the first relating to mail subsidy, and the second to general subsidy. These are not only kept entirely distinct in the provisions of the act, but are quite distinct in their general principle. The mail subsidy purports to be given on the basis of *value received* by the Government; that is, it provides a certain special price for mail-carrying contracts. If the Government does not receive value for what it pays under this system, then the system has no justification, and the payment must be regarded as a mere bonus. The general subsidy has, on the other hand, no element of a direct return to the Government, and is merely in the nature of Government aid to a so-called infant industry.

The new bill amends the Mail-Subsidy Act of 1891 practically in only two particulars—that is, it increases the compensation to the vessels, and makes a different classification under which the largest mail subsidies can at present be paid only to the four vessels of the American Line of over 10,000 tons burden and capable of a speed of twenty knots. Senator Frye, who stands as sponsor for the new bill, states that the postal subsidy rates under this bill are about one-third larger than those now paid under the act of 1891. It is proper, therefore, to inquire whether the service which the Government has been receiving under the act of 1891 is of such a character as to justify this increase in the payment.

During the last fiscal year of the Post-Office Department, the American Line carried about 71,000,000 grams of letters and 641,000,000 grams of printed matter, for which the Government paid to that line, under the Postal Subsidy Act of 1891, $528,537. During the same year the Cunard Line carried almost twice that weight of letters (137,000,000 grams) and 835,000,000 grams of printed matter, receiving for the service only $213,103; and the White Star Line, which carried about 62,000,000 grams of letters and 326,000,000 grams of printed matter, received but $91,591. That is, the Government is now paying the American Line at a rate about three times as high as it pays the other lines for carrying the same mails, and the only change contemplated by the present bill is the increase of this rate of payment. It is quite unnecessary to comment on such a change in the law. The simple explanation of the change is, that the postal contract of the American Line is about to expire, and that it desires to have the contract (which is now unjustifiable, so far as the public interest is concerned) renewed on a more lucrative basis.

The sections of the bill providing for a general subsidy are rather brief, and have none of the safeguards against abuses which have been so much discussed. That is, there is nothing in the bill which will prevent an empty ship from collecting full subsidy. This will interest those who contend that subsidy should be paid only in proportion to the cargo carried. There is no provision which will secure the establishment of any new means of communication, or will prevent this Government bounty from going as a bonus to those who are already engaged in the shipping business, even though they provide no increased facilities for the public. There is the same old provision about corporations owning vessels; that is, so long as the corporation is formed here, its stock may be owned by foreigners, and the subsidy may all go as dividends to foreigners.

There is no adequate guarantee that the subsidy will not be given to foreign-built ships whenever Americans consider it for their interest to buy these ships and to obtain a special American registry for them, as has been done so often in the past. There is apparently the same exclusion of Panama business from the commerce called foreign, although a large part of the trade with the west coast of South America is conducted by way of Panama, and although this is a trade which it is especially to the interest of the United States to develop. The rate of this general subsidy is one cent per gross ton for each one hundred nautical miles sailed. At this rate a steamer of ten thousand gross tonnage will earn one dollar a mile, both on the outward voyage and on the return voyage. There is an addition of 25 per cent. to this subsidy for the first five years of the life of vessels hereafter to be built.

There is no discrimination whatever in this system. The ship that carries out a cargo of American-manufactured goods receives no more Government aid than a ship of the same size which brings in one thousand immigrants from Russia or the Mediterranean; it is simply a crude, indiscriminate handing out

of public funds, with no attempt to recognize the fundamental principles behind all justifiable subsidies—if any are justifiable—that they should be given only in order to open avenues of commerce which do not already exist, and which could not be started without Government aid.

There is no limit as to the subsidy to be paid. It may be that for a year or two to come the amount will not exceed $9,000,000 per annum, the limit fixed by the old bill; but the serious effect of passing this bill would be that it would commit us to the principle that profits in shipping properly depend on Government aid, and not on economical conditions—that is, that foreign commerce is to be moved from the domain of business into the domain of politics. Does any one seriously think that, when once the country is committed to the doctrine that it is the duty of the Government to make foreign commerce profitable, at the expense of all other forms of business, the beneficiaries of the system will rest content with small subsidies? Has that been the history of pensions, or tariffs, or any other system of Government aid to individuals or classes? All signs point to an enormous increase in our foreign commerce. Our shipyards are blocked with business, and the official returns of the Treasury Department show a rapid growth of our trade in almost every direction. The question now is, Shall we go on and try to succeed in the field of the world's commerce by the means which are now giving us success, or shall we make success depend upon Government largesses and the efforts of the lobby?

THE JOHNS HOPKINS CELEBRATION.

Frequently the anniversary habit in our brand-new universities is about as naïve as the practice of that newly wedded pair who celebrated every week the coming round of Thursday, their wedding day, as an "anniversary." The completion of the twenty-fifth year of Johns Hopkins University and the retirement of its first President were, however, events so interesting that nobody will find their elaborate celebration other than fitting.

When President Gilman was called from the University of California to give shape to the indefinite bequest of Johns Hopkins, he came into unusual opportunities. The endowment, in that day of small things, was a generous one. The founder, being safely dead, required only gradual canonization, a far more facile and gracious service than that mollification and diplomacy to which presidents have frequently been driven in their dealings with living founders. The trustees, who had advised their eccentric associate to apply his fortune to the founding of a university and a hospital, were wise enough to confide absolutely the working out of this programme to the man of their choice. President Gilman, then, was free to found an institution unique in its day in America, of which productive scholarship should be the informing idea—free to take immediately the step which President Eliot, inspired even then by the same ambition, has since been able to take in the Harvard Graduate School.

Indeed, Johns Hopkins University, to educators of the old school, must have seemed a revolutionary enterprise. Nothing could have been more unlike an American college. The new school started with none but graduate students. To the older colleges, where genuine graduate students, except those in the professional schools, were scarcely admissible, this was a fatal putting of the cart before the horse. Then the new university lacked certain safeguards. No religious denomination vouched for it, nor any recognizable social tendency, while it conferred the strange degree, then usually "made in Germany," of Doctor of Philosophy. It made its start with a Virginian professor of Greek, late of the Confederate cavalry; a Baltimore editor; a young disciple of Huxley's; an eccentric English mathematician—with anybody who knew more about his given subject than anybody else. It manifested a sublime disregard for academic appearances and even comforts. It bought lavishly of books and scientific apparatus, but it set its handful of famous specialists to teaching in rookeries, chance-leased in the heart of the city. If the memories of these first eager days of close companionship between master and student have grown into a legend tenderly regarded of old Hopkinsians, at the time this complete ignoring of collegiate pomp and circumstance seemed almost suspicious.

From the very first, the University was forced to practise the virtue of renunciation. Omitting many subjects which are taught in the great universities of the world, it tried to give every subject in the best possible way. Probably many Americans, before the Johns Hopkins University naturalized the terms, knew that *Gründlichkeit* and the scholar's conscience were one and the same thing; and many of our scholars from an early period had exemplified in their work *wissenschaftliche Methode*. But this thoroughness and scientific method were still rather the possession of individual scholars than of institutions. For the new university was reserved the honorable part of first training systematically numbers of young scholars in the methods of pure research. For the first time in the century, it could fairly be said that America had a university which in quality, if not in scope, was the equal of any European institution of learning.

How this example became a leaven for the whole academic mass, how gradually, in spite of great and unmerited financial reverses, the university grew, here extending its older courses, there adding an undergraduate department and a medical school, is matter of recent record, and need only be recalled at this time. But a unique feature of Johns Hopkins life should not pass unmentioned: through the accident of its founder's residence, the University was set in a border city. Its unique character drew many students from the North and West; this, and its geographical situation, a far larger number from the South. The resulting association of men of diverse traditions and training was singularly advantageous. The Northerner came to see close at hand the sore problems left in the wake of the war; he came to recognize the admirable tenacity of purpose and the frequent heroism of the Southern young men, who, seeking the best education for themselves, carried back light and leading to their own people. He came, too, under the charm of the gracious social life of the South. Similarly, the Southerner gained in this contact. He soon lost certain religious and social prejudices, and came at least to admire the intellectual audacity and adaptability of the "Yankee," his efficiency and essential kind-heartedness. For twenty-five years now these young doctors have been scattering, chiefly to their own sections, but always a certain number of Northerners to the South, and vice-versa. Among these old Hopkinsians, professors mostly, and nearly all men of considerable prominence, there exists a strong fellow-feeling, and this academic comity has undoubtedly contributed, and will contribute, to the broader national comity which is to be.

The celebration last week was not only a tribute to the institution which has done so much to foster original research in America, but also a testimonial of a more personal sort to President Gilman, who turns over to younger hands the work he has shaped for a long future. It is characteristic of his manifold activities that he does not seek the repose he has so fairly earned, but is preparing to organize, in the fulness of his years, another and equally unprecedented foundation for research—the Carnegie Institution. No other man of our time has been so fortunate as to have the unhampered administration of two trusts of this character, and few educators have been privileged to accomplish a work at once so original and of so enduring value.

THE STRUGGLE FOR INDIVIDUALITY ON THE GERMAN STAGE.

BERLIN, February 9, 1902.

The German stage of the present day shows a curious mixture of high aspirations and imperfect fulfilment, of noble conceptions and brutal effects, of an ar-

dent desire for truth, freedom, nature, and of a tame subservience to conventional devices and artificial sentiment. In the early nineties, when the first powerful productions of Sudermann and Hauptmann filled the air with joyous echoes of the striving for a heightened existence both of the individual and of society, we dreamed of a new classic era of dramatic literature close at hand. We hoped that the young German writers who so boldly and with such earnest conviction had taken up the gospel of Ibsen, Björnson, and Tolstoy, would soon rise to the full height of their masters, or perhaps even surpass them. For it seemed as though there were something in these young writers, a certain sense of measure and tradition, a certain reverence for the human past, that in all their tumultuous strivings would keep them on the path of true art and preserve them from the merely volcanic, which, especially in the Scandinavian writers, not infrequently destroys the pure æsthetic enjoyment of modern poetry.

These hopes, if I may be permitted to give to my own experience a somewhat wider application, have been sadly disappointed. Instead of pressing on toward the goal of an art embodying in vigorous, free, and impressive types the ideals of modern humanity, and thus holding up before the eyes of the present the life that is to come, the German dramatists, or most of them at least, have again fallen back to that position from which the whole movement of "Youngest Germany" started some fifteen years ago—the position of an essentially negative and pessimistic analysis and arraignment of existing conditions. That in taking this stand they give expression to a large and important part of the intellectual life of modern Germany, can hardly be denied; for the natural counterpart of the reigning imperialism and officialdom has been the growth of a public opinion so peevishly sensitive to even the slightest encroachments on personal rights, so eagerly insisting on free inquiry, so boldly—and often with such bitter sarcasm—exerting its function of a searching criticism of public affairs, as is scarcely to be found in countries where individual liberty is more firmly guarded. In no other country, for instance, would the artistic views of the chief of state have aroused such violent antagonism, or would his efforts at putting these views into practice have been received with such a flood of biting satire, as was the case with the Emperor's recent utterances on art addressed to the sculptors of his monumental gifts to the city of Berlin. Nor is it likely that the appointment of a Catholic professor of history beside that of a Protestant—which recently took place at the University of Strassburg—would in any other country have led to such a storm of indignation, such protestations of principle, such abuse of Government interference with professorial standards of impartial inquiry, as shook German academic circles some weeks ago.

As a reflex, then, of public affairs, the German drama of the last few seasons, disappointing as it is when considered from the point of view of ideal art, is still an extremely instructive phenomenon. The clash between the individual and society which, in one form or another, may be said to underlie all tragic situations in real life as well as in art, has received in the German drama even of very recent years some new and interesting impersonations. What seems to me regrettable is, that in hardly any of these recent dramas is there a ray of hope, a suggestion of a possible delivery from the social conflict except by self-destruction of the individual; that, on the contrary, this self-destruction is constantly being insisted upon in these dramas as the only and as a truly heroic solution, even where there seems not the slightest necessity for it, since a little more common sense and large-mindedness and a little less wilfulness and sentimentality would have obviated all difficulties.

A striking illustration of this drift towards the needlessly tragic and its painful results is a drama which is at present holding a prominent place in the repertory of almost every German theatre; which, moreover, through the award of the Grillparzer prize and a nearly unanimous approval of the leading critical reviews, has obtained the highest literary distinction. I refer to Otto Erich Hartleben's "Rosenmontag." The hero of this drama is a Prussian officer who falls a victim to the petty prejudices and hollow ambitions of caste. He is a dreamer, an idealist, a man to whom purity of heart is the highest demand of life. He has fallen in love with a simple burgher maiden, without realizing that, as long as he remains an officer, there can be no question of marriage with this girl. Two of his comrades, cousins of his, in whom the sense of family pride and social standing seems to have absorbed every other intellectual or emotional faculty, take it upon themselves to save him from embarrassing situations by acting the part of his Fate. First they separate him from the girl by bringing it about that he is for a time detached to another garrison. In leaving, he intrusts his love to their protection. This confidence they abuse by persuading the girl that he has become engaged to another, while at the same time representing to him that his love has broken her faith. The news of her alleged treachery prostrates him physically as well as mentally, and when, after a year of illness and agony, he actually becomes engaged to a rich society girl, this is clearly a symptom of his shattered ideals. Thus he returns to his old regiment, only to find out what a shameful trick has been played upon him. Now he is beside himself with rage and indignation. He has a violent rupture with his comrades; he defies the military code of honor; he takes his old love back, and, after a few days' revelling in bliss, ends his life together with hers.

Hackneyed and crude as this plot is, I am far from denying that it is worked out with unusual cleverness and brilliancy of dramatic invention. The officers' life, with its racy, frivolous jargon, its well-mannered and well-meaning inanity, with its jolly comradeship and its brutal conception of woman, is portrayed here with astonishing vividness and truthfulness. Although during the whole play we do not get beyond the limits of the barracks or the officers' casino, the only woman character of the plot being the deserted girl, there is not a moment of dulness or monotony in it. As an historical document, as a comprehensive and cutting satire on military life in Germany at the beginning of the twentieth century this drama is undoubtedly a notable achievement, and will stand in literary history by the side of such Storm-and-Stress productions as Wagner's "Die Kindermörderin" or Lenz's "Die Soldaten." All the more disappointing is it that the author, who knew so well how to castigate social foibles and depravities, should not have been happier in depicting genuine human feeling, that he should not have been able to create a hero capable of something besides ranting and fuming against military conventionalities and then blowing his brains out. There is really not the slightest reason in the world why this man, after he has found out that his love always has been and still is faithful to him, should not with a light heart bid good-bye to all these glittering frivolities, and begin, together with the woman of his choice, a new, serious, and happy life. Is an officer's life, then, everything, even in Germany? Is the only alternative left to this man really either to stifle the best instincts of his being or to follow the contemptuous advice of a comrade of his—"Then go to America and turn waiter"? And even this latter choice, would it not have been manlier and more genuinely human than this absurd refuge in the Nothing? How differently has Ibsen, in his "Enemy of the People," tackled a similar problem! How radiant and triumphant does the personality, in the midst of defeat, here stand out at the end against the unreasoning and unfeeling herd of the "solid majority"! In Hartleben's play, in spite of all the lofty talk and noble sentiment, there is at the end nothing left but moral numbness and submission to the dictates of an artificial etiquette.

I cannot bring myself to speak at length of a recent production of Sudermann's, which was first put on the boards of the Deutsches Theater last week, under the curious misnomer of "Es lebe das Leben!" For nothing could be more devoid of the real feelings for which life stands than this painfully thought-out parody of life; and it is truly saddening that a man who began his literary career in accents that reminded one of the young Schiller, who, even in his "Johannes" and "Die drei Reiherfedern," seemed to strive after the heights of life, should now stoop to the pseudo-tragedy of social scandals not a whit more uplifting or less mawkishly sentimental than the much abused plays of Kotzebue or Paul Lindau. What leads me to mention this doleful production here is the fact that it is another flagrant instance of that lack of a bold and consistent personality, along with and in spite of a certain attitude of protest against social tyranny, which seems to me responsible for the ultimate artistic failure of Hartleben's "Rosenmontag."

In Sudermann's play also the hero, or rather the heroine, sacrifices herself without any sufficient reason, nay, even without any intelligible purpose. She sacrifices herself, she thinks, in order to save the life of her lover, with whom fifteen years ago she had transgressed her marriage vows, and who since then has lived unsuspected in ideal friendship with herself and in close comradeship with her husband, until a sudden exposure brings the two men into irreconcilable conflict. But how is it pos-

sible to think that this man, after her self-destruction, should take up life in the sense she wishes him—namely, as a champion of the Conservative cause against the destructive tendencies of Social Democracy, since, as he himself expresses it epigrammatically, he "must live on because he is dead"? She sacrifices herself also, she thinks, in order to rescue her husband from an impossible situation, apparently without realizing how little this sacrifice can do to atone for the protracted falsehood and lie of fifteen years. Finally, she sacrifices herself in order to keep the Conservative party from the scandal and confusion which would arise from an open conflict between the two men, both pillars of law and order; and again she seems to be entirely blind to the fact that nothing will more clearly reveal the "skeleton in the closet" of the Conservative party, and more directly and irretrievably hurt the cause of law and order, than her own suicide.

In short, the motives which actuate the events in this play are artificial to the last degree; and while there runs a hidden protest through it against the suppression of individuality demanded by the complicated moral code of the modern state, there appears not a single character in it who dares to be truly himself, and most of the characters (to borrow one of the author's own phrases) seem to be living in a prison which they themselves guard. A sorry turn, indeed, to be taken by the author of "Heimat."

It would be superfluous to dwell on other dramas of recent date, such as Philippi's "Das grosse Licht" and "Wohlthäter der Menschheit," which show this same curious mixture of individualistic leanings on the one hand and submission to social convention on the other. It is, however, worthy of mention, since it is characteristic of the whole state of contemporary German culture, that the only play of the last few years in which a powerful personality successfully asserts itself, is an educational play—Otto Ernst's comedy, "Flachsmann als Erzieher," a brave, timely, and amusing plea for individuality and common sense in the instruction of children. The way in which the ideas of Pestalozzi and Froebel are here given form in an inspired young teacher who fights to the end and maintains his ideals in spite of endless intrigue, slander, and malicious machinations on the part of his colleagues and superiors, is truly delightful; and the only pity is that the sphere of action in this piece is too narrow to give room for a really free and large artistic movement.

When will the German drama fulfil the prophetic message of fifteen years ago, free itself from the shackles of sentimentality and conventional formality, and rise to a really human representation of the great conflicts of modern life? Björnson's "Beyond Our Strength," which is being performed with such masterly skill in all the great German theatres, should point the way toward this goal. KUNO FRANCKE.

SUDERMANN'S NEW PLAY.

BERLIN, February 14, 1902.

Dramatic interest in Berlin centres just now in the Deutsches Theater, where Hermann Sudermann's newest play, "Es lebe das Leben," is attracting crowds of interested spectators. The piece promises to be a pronounced theatrical success. On the first and second nights, loud applause marked the close of the second, third, and fifth acts, and was in no wise lessened by the repeated appearance of the author before the curtain. In the case of all such ovations it is, of course, difficult to decide how much is to be credited to real interest in the play, and how much to the desire to see a live literary lion. The applause on these occasions marked, at all events, the points of highest interest for the spectator.

The Deutsches Theater knows how to give a play by Hauptmann or Sudermann. This circumstance insures a sympathetic and adequate representation of the new drama. Players and author work together so harmoniously in this case that the spectator forgets to think about the probability or improbability of what is going on before his eyes. For the time being, he sees and hears only facts, and about the reality of facts there can be no disputing. Nor does the interest lag at any point in the whole representation. A play which so holds your interest and attention that you forget to pick flaws in it until you leave the theatre or read it in peace at home, may be said to have attained at least one of the ends for which it was written.

Sudermann is dealing here with a gruesome theme. The presupposition of the whole is a case of marital infidelity in the higher circles of Berlin. It is hardly fair to call it a drama of adultery, for the degree of grossness of the infidelity is veiled in the discreetest silence. In any event, fifteen years of correct living have passed since then, and the secret seems for ever safe, when the action of the play begins. The persons are, with few exceptions, Berlin aristocrats of to-day. The time is the end of the nineties, when the new Civil Code was taking shape in the Reichstag. The title (whatever else it may also mean) points to a passage towards the close of the fifth act, where the guilty wife proposes *a toast to life* at the moment when her own self-inflicted end is near.

The scene of the first act is in the house of Count Kellinghausen. He is a man of infinite good-nature and kindness, but otherwise quite mediocre, whereas his wife Beate is the dominating figure of the drama. For twenty years she has played the rôle of wife and mother to his entire satisfaction. In spite of such continued ill-health that every day she lives is in a sense the gift of the physician and the apothecary, she is the admired social leader, and makes his house a centre for the fashionable and poliical world. Fifteen years before, her heart had passed out beyond the bounds of her conventional marriage and had found the object of its unwavering affections in Baron Völkerlingk, whose frivolous and heartless wife had made domestic happiness an impossibility for him from the beginning. He has meanwhile become, through force of circumstances, the warm friend of Kellinghausen, and sees in the painful restraint of the resulting Platonic relationship with Beate something of penance for his wrong. A sense of guilt oppresses him; but although she has struggled with him through to the purer relations of these later years, she rejoices in her love. Her chief aim in life is to be his counsellor and stay, to further his political career, and to awaken in him the ambition for that great future for which she thinks him fitted. His ability as an orator had won for him a commanding place in his party, but the favor of his constituency was fickle and he had lost his seat in Parliament. Although fanatical in his devotion to his party, Kellinghausen has no real aptitude or fondness for public life, and gives up his own candidacy in favor of his friend. Such is the situation at the beginning of the first act. The election returns are just coming in. As we wait for their favorable outcome, we learn from the conversation of Beate and Völkerlingk the history of their past. The premonitions that fill his soul prepare us for the impending disaster. The coming and going incident to the reception of the news from the polls introduces us to nearly all the persons who appear in the play. From the start the poet begins to interweave the love affair of Beate's daughter and Völkerlingk's son with the chief action.

The second and third acts are also in the house of Kellinghausen. An evening gathering brings together the leading lights of the Conservative party. Most of them carry in their pockets a copy of the Social-Democratic paper containing a report of a campaign speech by Völkerlingk's former secretary, Meixner, in which pretty clear allusions to a scandal in the house of the host are made. A copy of the paper, still in its wrapper, lies upon the writing-desk. Völkerlingk's wife, in possibly the poorest scene of the play, sees to it that Beate reads the critical passage. The leaders of the party find occasion to draw from Völkerlingk, who has also received the newspaper, a promise to speak in the next session of the Reichstag upon the burning question of the modern marriage. His honor has been publicly attacked, they argue, and he can silence his opponents and do his party a service in no better way than by becoming their spokesman on this important occasion. In short, everybody knows of the matter except Kellinghausen. But Völkerlingk's son has just issued a pamphlet in which he holds the unorthodox view that the nobility should not fight duels to defend their honor. On this evening the men present, and especially Kellinghausen, combat his theories. In the course of his argumentation he mentions the attack in the newspaper, and so even Kellinghausen is at last informed.

The next day ushers in the third act. Fully convinced of the innocence of his wife and his friend, Kellinghausen goes to institute legal proceedings for slander against Meixner, but the Conservative leaders urge that such public action would only stir up a scandal and injure the party. Without in reality giving up his purpose, he agrees to postpone action for a time. On his return home he asks his friend and his wife, as a matter of form, to give their word of honor that the charges are false. The man is ready, but the woman comes out with the truth, for she is convinced that Völkerlingk's lie would necessarily be followed by his death at his own hands. From that moment her course is clear to her; she must end her life that he may live and fulfil his high destiny. In the short time that yet remains to her she must accomplish three things: save appearances, insure the happiness of her daughter and

Völkerlingk's son, and keep both men in total ignorance of her intention. Left to themselves, they agree that a duel is impossible out of regard to the interests of their party and their families, and that Völkerlingk is in this case the one who must quietly leave this world.

The fourth act brings us to Völkerlingk's house. He has meanwhile delivered his speech on the marriage question and scored a great triumph. It is whispered along the line that the Emperor thinks he can use such a man in his Cabinet. Meixner appears, for reasons which do not concern us here, and surrenders the letters which are the sole proof of his charges. Everything beckons the doomed man back into life at the very time that he must end it. Then Beate comes and secures his promise that he will not carry out his purpose immediately. Her husband has determined to do one thing more to save appearances, and plans a breakfast for the orator at which the leaders of the party will also be present. After that, Völkerlingk may steal out of the world as quietly as he will.

On the morrow the breakfast really takes place. Kellinghausen intends that his wife shall leave his house that day for ever. She plans it too, but not as he means. The guests come, the quondam friends drink to each other's health. Beate also has her toast to offer. She reminds them how she has struggled with death for many years, and has yet found existence so beautiful and desirable that she can fitly propose today a toast to life. As the glasses clink in response to her little speech, she is seized by a spasm of pain and weakness and totters out of the room to die. When the two men stand later alone in the breakfast-room and read the letter which she has left for them, her purpose is clear. Her physician had given her a powerful medicine to be taken in the smallest quantities. An overdose meant death, but the uninitiated could not suspect her of suicide. To avert scandal, Völkerlingk would now have to live. Without him her life would really have been at an end, for he was all of life to her. And so by her act she drove him back from the grave into that career for which she had striven to fit him.

Such a bald account of this long and intricate drama must necessarily leave unmentioned all minor action and minor characters. It can still less do justice to the technical skill and the workmanship which seem to promise great success for the play upon the stage. Whether the reading public will welcome it is another question. The number of dramas which are effective both on the stage and in the closet is so small that the chances are decidedly against every new claimant for that high honor. It may be that Sudermann will have to be content this time with the more transient approval of the theatre-goer. For, to pass over all other considerations, the drama is, when you come to read it and think about it, full of improbabilities. The whole basis is improbable. It is improbable that a woman so pure of heart as Beate, so high-minded, so discreet, so tactful, would enter into such a relationship. It is improbable that two people who have lived a lie for fifteen years would hesitate to tell one, especially if they thought they could not be caught. It is improbable that a Prussian nobleman of to-day would permit party considerations to hold him back from a duel when he thought the honor of his family at stake. It is improbable that the breakfast scene could take place. In fact, the whole is a tissue of improbabilities, which the skill of poet and actor makes for a brief season seem most real.

CHARLES HARRIS.

Correspondence.

DEAN COLET AND MR. CARNEGIE.

TO THE EDITOR OF THE NATION:

SIR: In your recent article on "Perpetual Educational Trusts," I read with interest the praise of the discretion, the wisdom, and the humor of Mr. Carnegie in empowering the trustees of his magnificent institution "to modify the conditions and regulations under which the funds may be dispensed." "It is strange," your critic continues, "that so simple and sensible an attitude should be *unique* among great benefactors. . . . In this matter, Mr. C. has set most gracefully an example which is worthy of general imitation." An example decidedly worthy of imitation, but *not set for the first time* by Mr. Carnegie.

In the history of English education, this example was set by no less a man than Dean Colet in 1509, in the Statutes given to his then newly founded School of St. Paul's, originally planned for 153 boys. The tremendous growth and future importance of this school could never have been foreseen by its founder, but was made possible by the addition to the Statutes of a final paragraph, which has the title, "Liberte to Declare the Statutes," and which reads in part as follows:

"And notwithstanding These statutis and ordinancis before writen in whiche I haue declarid my mynde and will yet (because in tyme to cum many thyngis *may and shall* surwyne [supervene] and grow by many occasions and causis which at the makyng of this boke was not possible to come to mynde: In considering the assurid truyth and sircumspect wisdome and faithfull goodnesse of the most honest and substanciall feloshipp of the mercery of london to whome I haue committid all the cure of the scole. . . . I leve it hooly to theyr dyscrecion and charite. . . . They to adde and diminish vnto this boke [viz., of Statutes] and to supply in it every defaute, &c."

I have often been astonished that these golden words seem to be utterly unknown. I have never seen them even alluded to in our popular histories of education, which are so busy about defining the pedagogical "methods" of the different ages from the Assyrians down to Horace Mann. I have been astonished, further, that Colet's noble example has scarcely (if at all?) been imitated, and that our modern educational statute-makers have gone on making decrees to last "for ever and ever." In this respect, Mr. Carnegie's tact and example are, indeed, not only praiseworthy, but epoch-making.

As a practical man I am particularly pleased that Mr. Carnegie did not restrict the endowment fund to his (first?) magnificent gift of ten millions.

Yours respectfully, EWALD FLÜGEL.

STANFORD UNIVERSITY, CAL., February 12, 1902.

AN EDUCATIONAL CABINET.

TO THE EDITOR OF THE NATION:

SIR: In your issue of the 13th inst., while discussing the feature of the revised New York charter which *allows* the head of any administrative department to occupy a seat in the Board of Aldermen and to participate in its discussions, you are pleased to say that, " so far as we can recall, this is the first time that the principle of giving department heads the right to speak in a legislative body has been applied in this country," etc.

Allow me to say that the St. Louis Board of Education, ever since, five years ago, it ceased to be a political body, has *required*, under its adopted rules, the chiefs of its departments, as created under its charter, to wit, the Superintendent of Instruction, the Building Commissioner, the Supply Commissioner, the Auditor, and the Secretary and Treasurer, to be present at all sessions of the Board, to answer all inquiries made of them by members, to explain and state their views, pro and con, upon any proposition that may be under discussion, and to be ready, with their professional knowledge, to assist in the educational and administrative work that may be on hand. They have their permanent desks within the area occupied by the Board, and there is not a session where one or more of them are not called upon to give their expert opinion upon whatever matter of importance, touching their respective department, is under consideration.

The system works admirably, facilitates legislation, and brings about a harmonious method of operation between the legislative and executive forces of the Board such as no other system could.

Respectfully, W. T.

ST. LOUIS, February 17, 1902.

EARL DURHAM'S CANADIAN REPORT.

TO THE EDITOR OF THE NATION:

SIR: Your reference, on page 132, to Durham's interesting Report on Canadian matters in 1839, suggests the query, Can a local legend be confirmed, viz., that the writing of the Report was in the main by Christopher Dunkin, a teacher of Greek at Harvard in 1837? It is thought that the original draft by Dunkin was probably amended and polished by Charles Buller and the other official secretary that the Earl brought out with him, but that it is substantially Dunkin's work.

Is this historical? And what, if any, is the evidence sustaining it?

J. DAVIS BARNETT.

STRATFORD, ONT., CANADA, February 17, 1902.

Notes.

Herbert S. Stone & Co. are to bring out a Dictionary of Art, beginning with the Renaissance, and including the great painters and sculptors down to the present time. It will be illustrated.

The Autobiography of the late Lieut.-Gen. Sir Harry Smith will be published shortly by E. P. Dutton & Co.

From John Lane's spring announcements we select 'Dante and the Divine Comedy;

Studies and Notes,' by W. J. Payling Wright; 'Persian Children of the Royal Family,' the narrative of an English tutor, Wilfrid Sparroy; 'With Napoleon at St. Helena,' from the Memoirs of Dr. John Stokoe, Naval Surgeon; 'Terrors of the Law,' portraits of three lawyers, by Francis Watt; 'New Poems,' by Theodore Watts-Dunton; 'India's Love Lyrics,' collected by Laurence Hope; a series of illustrated books on gardening—'In a Tuscan Garden,' 'In a Vicarage Garden and Elsewhere,' by the Rev. Canon Ellacombe, 'A Garden in the Suburbs,' by Mrs. Leslie Williams, 'Stray Leaves from a Border Garden,' by Mary Pamela Milne-Holme, and a new edition of Forbes Watson's 'Flowers and Gardens'; 'Modern British Domestic Architecture and Decoration' and 'Modern Pen-Drawing—European and American,' both edited by Charles Holme; finally, 'Modern Design in Jewelry and Fans.'

Additional announcements from Charles Scribner's Sons are a 'History of English Literature,' by William Vaughn Moody and Robert Morss Lovett of the University of Chicago; Paulsen's 'Immanuel Kant,' translated by Professors Creighton and Lefevre of the same university; 'American Citizenship,' by Justice Brewer of the Supreme Court, first of a series of annual publications of the Dodge lectureship at Yale on the Responsibilities of Citizenship; and 'Letters from Egypt and Palestine,' by the late Maltbie D. Babcock, D.D.

McClure, Phillips & Co. announce for publication in the spring 'Political Portraits,' by William Allen White; Unpublished Letters of Daniel Webster; 'Wireless Telegraphy,' by Guglielmo Marconi; 'The Making of a Statesman,' a novelette and other Georgia stories, by Joel Chandler Harris; 'The Madness of Philip, and Other Stories of Childhood,' by Josephine Dodge Daskam; 'A Musical Guide,' by Rupert Hughes; and a facsimile of Charles Lamb's 'King and Queen of Hearts,' published in 1806.

President Sharpless's meritorious work, 'A Quaker Experiment in Government,' has met with sufficient approval to warrant a popular edition in a single volume. This is now brought out very attractively by Ferris & Leach, Philadelphia; but we could wish the index had been enlarged and modernized—and made veracious, for several references (beginning with the very first!) are to pages no longer to be found in volume ii., and betray an extensive abridgment not acknowledged on the title-page.

A third edition of Dr. John C. Thresh's manual of 'Water and Water Supplies' has recently been issued (Philadelphia: P. Blakiston's Son & Co.). The book has been brought up to date, and now includes additional chapters on the protection of water supplies. Its main object is to place within the reach of all persons interested in public health the information requisite for forming an opinion as to whether any proposed supply is sufficiently wholesome and abundant, and whether the cost can be considered reasonable. It does not in the least pretend to be a treatise on engineering. Dr. Thresh's manner is lucid, and imparts an interest to such questions as the composition and properties of water, that one would scarcely suppose could be put into them. Although he always has the English public in mind, the larger part of his book is applicable to our own affairs without modification.

Under the somewhat invidious title 'The American Immortals,' G. P. Putnam's Sons publish a large and very ponderous quarto, resplendent in red and gilt binding, containing accounts of the twenty-nine persons whose names are now emblazoned in the "Hall of Fame." These accounts have been prepared by George Cary Eggleston, with the purpose of presenting critical estimates, "with so much of biography in each case as is necessary to a due comprehension of the subjects." Since the respective claims to immortality must be presented on an average within the compass of 14 pages of large print, and Washington, Jefferson, Franklin, and Adams take 95 pages, Webster and Clay occupying 75 more, the remaining heroes have but a slender chance for an "intelligent account of their character, achievements, and history." To this some of them might be reconciled, could they read the damning estimate of the morals of certain of the glorified—notably Webster—and think of their own shortcomings. Truly, not merely the feet but much of the frame of these idols was clay. But we all know that Zeus and Apollo had human frailties, and it would not do to set the standard of American immortality too high. The portraits are hardly worthy of so gorgeous a volume, many of them being hard and coarse; but, on the whole, the book may be commended as carrying out in an appropriate manner the purposes for which the "Hall of Fame" was founded.

A special feature of Prof. Edward Capps's 'Manual of Greek Literature from Homer to Theocritus' (Charles Scribner's Sons) is the endeavor to illustrate each author, as far as possible, by copious selections from the best English translations. Naturally this mode of illustration is carried further for the poets than for prose writers. The selections are well chosen, and will prove most useful to students who, through force of circumstances, have been obliged to confine themselves to a hasty or superficial acquaintance with the Greek language. As compared with Jevons's excellent manual, with its freshness, its detail, and its discussion of technical points, Professor Capps's work may be called popular; but there is nothing sketchy or second-hand in its mode of treatment. The style is easy and interesting, the proportion and perspective well preserved, the scholarship thorough and accurate. The chapters on Tragedy and Comedy are particularly strong, as might be expected from a scholar who has made special researches in the history of the Drama and the question of the Stage. Very useful, also, and informing is the treatise on the lost literature of the fourth century B. C., as well as the bibliographical appendix. The book will commend itself to a wide class of readers as well as to the learner in Greek literature; it should also be kept in mind by instructors in general literature.

To David Nutt's excellent little series, "The Ancient East," Professor Zimmern of Leipzig has added a brochure, 'The Babylonian and the Hebrew Genesis.' It is clear, readable, and careful in an eminent degree. The treatment of the Tehom myth, often so obscure, is especially good. Professor Zimmern holds that these Babylonian stories entered Palestine in the middle of the second millennium B. C., and that the Israelites found them there. That they could have been transferred as late as the exile, he cannot believe.

To the International Theological Library Principal Rainy of Edinburgh has contributed a very racy volume on 'The Ancient Catholic Church' (Charles Scribner's Sons). It covers the period from 98-451 A. D., is most excellently and clearly arranged, with a well-marked order, and is written in a downright style, simple and unpretentious. Simplicity, indeed, and perspicuity are the keynotes, and too great burden of detail is avoided. The bibliography is tolerably full, but wider and more exact references to sources and discussions, especially modern, might have been looked for. Dr. Rainy apparently did not write, at least in the first instance, for the student who desires to work out his own historical salvation, but for those who can be fed with a spoon. As a criticism of detail, the description of thought and feeling in the Roman world into which Christianity came is hardly adequate. Of the manifold Oriental influences and the changes which they had wrought, little account is taken. Such a phenomenon, for example, as Apuleius, is passed with a word, and Apollonius of Tyana, an even more significant figure, has scant attention. Yet, to the onlooker of the time, Christianity could have seemed only one wave in the Oriental flood which was rising so fast. Some similar exceptions might be taken by the student of history and philosophy in the large; but to lay stress on them would be unfair towards a very fresh and able book.

Dr. Rodkinson has added to his translation of the Babylonian Talmud the first half, chapters one to five, of the tractate 'Baba Bathra.' Strictly, the tractate deals with the law of occupancy, and is mainly derived from the Roman law of *usucapio*, but its chief interest will probably be found in its incidental and Haggadic elements. Thus, the first chapter contains the celebrated passage giving the Talmudic view of the canon, order and authorship of the Old Testament, and the fifth has a string of Haggadas like nothing so much as the "biggest lie" stories known to folk-lorists. Throughout the whole volume we are kept facing the question of jest or earnest. Whether these venerable doctors always had straight faces, or have been playing a series of gigantic jokes on generations of dutiful students and interpreters, each reader must settle for himself. Much will depend on his own sense of humor.

The Italians have a graceful custom of printing as a wedding offering an essay, or inedited rarity, in literature or history, which might elsewhere appear in the less attractive form of thesis or appendix. A fine specimen of this is shown in 'Cenni Storici sulle Imprese scientifiche, marittime e coloniali di Ferdinando I.,' Grand Duke of Tuscany, 1587-1609 (Florence: Press of G. Spinelli). The author, Gustavo Uzielli, after an address to the bride, in which he traces the genealogy of the Uberti, gives an account of the Grand Duke Ferdinand, who continued in an unpropitious time the Tuscan reputation for culture. Besides this essay, there are a list of works printed at the Medicean Press; reprints of old pictures of a naval battle in 1602, and of the capture of Bona in 1607, with contemporary accounts of the latter exploit and of the capture of a naval convoy in 1608; and, finally, nine letters—among them one in which the Grand Duke asks the General of the Jes-

uits for credentials for four of his subjects, who are going to the East Indies to hunt for precious stones to adorn the Medicean Chapel at S. Lorenzo. The material is generally entertaining, and the paper and presswork are worthy of a bridal gift.

The yearly volume of Transactions and Proceedings of the American Philological Association, for 1901, has made its appearance. It contains the proceedings of the regular annual meeting, held at Cambridge in July, the special meeting held in Philadelphia the preceding December, and the meeting of the Pacific Coast branch, in session at San Francisco at the same time. Twelve papers are presented in full, but one of which is of general importance—the "Causes of Uniformity in Phonetic Change," by President Benjamin Ide Wheeler. It is impossible to summarize here the line of argument by which he sets aside the theory of Paul, explaining phonetic change as due to a gradual, insensible shifting of the memory image, making itself felt in equal measure and at an even level throughout the entire like-conditioned material of the speech of a community, and substitutes for it his own belief that sound-change "eats its way into language and passes from word to word." In addition to the twelve papers given in full, abstracts of about fourscore more are presented, many of which have already found publication through other channels. The Association is financially on a good footing, and has shown a commendable spirit in voting a subvention of £40 per year for three years to the Plato-Lexicon in preparation under the editorial supervision of the veteran Professor Campbell. It has also shown a wise spirit in dropping from further consideration the request of the Director of the United States Geological Survey for aid in the formation of certain new scientific terms. A committee was appointed at the special December session to take the request under consideration, but the committee conservatively expressed its lack of conviction that the contemplated overthrow of the old nomenclature is either practicable or desirable, presented a few newly created terms merely as specimens (horrible examples?), declared that the Geologists must be responsible for their own linguistic ventures, and asked to be discharged—a request which was unanimously granted.

The principal article in *Petermann's Mitteilungen*, number one, is by Dr. A. Stübel, on the principal centres of volcanic action in South America, and the distinguishing characteristics of the active volcanoes, 117 of which are shown on the accompanying map. Prof. P. Langhans tells of the richness in pure copper and iron of the region on the western shore of Lake Tanganyika, and E. Berdau describes the giant trees of California, whose imminent destruction by forty-two lumber companies he deplores. Their age he estimates at from 5,000 to 9,000 years, and asserts that "they could, judging from their condition, grow indefinitely without ever succumbing to old age."

Dr. Stein, the well-known archæologist, late of Punjab and now of Calcutta University, has recently published a preliminary report of his last excavations in Chinese Turkestan. Sanskrit scholars will welcome the unexpected proofs of early Hindu occupation of this remote region, north of Kashmere, and classical scholars may be surprised to find in the very beautiful plates which accompany the report ocular evidence of the fact that Greek art was known and imitated as far east as Khotan in the first centuries of our era.

Among the liberal innovations of the present French Ministry one deserves to be widely known to scholars. The Minister of Public Instruction last November created a special section in the libraries of Sainte-Geneviève in Paris, and the university libraries of Besançon, Dijon, Lille, Montpellier, Nancy, Poitiers, Rennes, and Toulouse, for long-term loans of books needful for the prosecution of studies extending over a considerable period of time. The publications in question are such as have been made by or under the auspices of the above-named department. Under proper guarantees as to intended use, responsibility, liability for loss and for cost of transportation, such publications may be kept not longer than five years.

—Macmillan's new series of Guides seems fairly well adapted for the flying tourist who must read as he flies, and be told what to look for on his flights and what to think when he looks. In three little volumes of about 250 pages each the western Mediterranean, the eastern Mediterranean, and Palestine and Egypt are covered, and covered with adequacy. Of course, there can be in them nothing of that detail and scientific precision which make a Baedeker a book of reference as well as a guide-book, but they will undoubtedly have a sphere of their own beside their larger and more ambitious brethren. Yet it is a pity that advertisements have been admitted, and also that the contributions of specialists are anonymous. The veil, however, is transparent, and betraying idiosyncrasies sometimes appear. The general editors should see to it that these do not become too rampant. The learned writer on Damascus, for example, might with advantage drop attempts at derivations for that name and for ash-Sham, and he of Constantinople need not give the technicalities of Muslim prayers in Persian. Probably, too, only one Orientalist ever had the unhappy idea of spelling Koran with a "Kh." Over the anonymity of Morocco the veil is peculiarly thin; the writer in this last case, however, whatever his technical scholarship, knows the ground well. But, above all, a guide-book should not sanction such "private interpretations" as that of John xx, 3-10, given on pages 43 ff. of 'Palestine and Egypt,' etc. The editors might well abate the didactic loquacity of this writer. It takes up much space, is not to edification, and will move many to unseemly mirth. It is also somewhat strange that a professedly small and cheap series should make a special feature of a careful and evidently excellent account of the different harbors of the Mediterranean. Yachtsmen will surely not be so limited in point of purse, time, or weight. There are numerous maps and plans which are mostly clear, full, and good. The series can in general be commended; some parts of it are excellent.

—Two years ago, under instruction from the Russian Ministry of Ways and Communication, A. I. Dmítrieff-Mámonoff and A. F. Zdziárski prepared a 'Guide to the Great Siberian Railway' upon a monumental plan. It is a large octavo of 520 pages, illustrated by two phototypes, 360 photogravures, four maps, and three plans of towns. A French translation was made for use in the Paris Exposition of 1900, and now we have an English translation, by Miss L. Kúkol-Yasnopólsky (revised by John Marshall), which is on sale by G. P. Putnam's Sons. The work is crowded with information of every sort, and is an invaluable handbook for the increasing number of travellers who will choose the Siberian route to the Orient. It will serve also for the general reader to give a new idea of the remarkable resources opened up by this railroad for Russian settlement and business enterprise. Tributary to the railroad, and connected by the numerous lines of water communication which it crosses, there is an area of rich, arable land equal in size to the States of Ohio, Indiana, Michigan, Illinois, Minnesota, Iowa, and Nebraska, and very similar in material resources. The vast plains of the Obi Valley correspond closely to the prairie region of the upper Mississippi, with the climate of northern Minnesota and Manitoba. The geological explorations in connection with the construction of the railway have brought to light extensive deposits of coal and iron in widely distributed areas, so that home manufactures are likely, in the immediate future, to supply the wants of the rapidly increasing population, which already numbers more than 7,000,000. Now that the last rails have been laid upon the Chinese Eastern road, it is possible to go without changing cars from Moscow to Vladivostok or Port Arthur in less than twenty days, which eventually will be reduced to ten or twelve days. From the tourist's point of view, the trip of nearly 6,000 miles will ever continue to be one of the most varied and interesting anywhere to be found in the world, while the cost of a first-class ticket, including sleeping accommodations, will be only $60, and second-class, with similar accommodations, only $40. In general, the English translation is very good, and the illustrations, mostly from photographs, are exceedingly instructive. The reader will be confused by the failure of the translator to indicate the standard of measurement used in estimating areas. Evidently the square mile used is the German geographical square mile, which is sixteen times the English square mile. But of this the reader is not duly warned.

—The little volume on 'Edwin Booth,' by Charles Townsend Copeland (Boston: Small, Maynard & Co.), in the series of the "Boston Biographies," is a model of its kind, being at once compact and comprehensive. Mr. Copeland, of course, has nothing new to tell concerning the salient facts in the private life or professional career of Edwin Booth, and purposely omits the minor details with which some of the larger biographies are clogged; but he has furnished a most intelligent and sympathetic appreciation of the actor and the man, in which cordial recognition of his genius and his virtues is mingled with judicious criticism. As a contribution to theatrical literature it is of infinitely greater value than many more pretentious works of a similar character, and it may be commended especially to younger students of the stage, as a notably just and vivid summary of Booth's accomplishments and the part which he played in the theatrical history of his time. Not everybody, presumably, will

agree with all of Mr. Copeland's conclusions with regard to the merits of individual performances, but few will deny the critical sagacity which he displays, his knowledge of the subject, his sense of proportion, or his admirable consistency. A particularly interesting feature of the book is some hitherto unpublished correspondence of the actor, which brings into strong relief some of his most charming natural traits, his courage in affliction, the vein of playful humor that lightened his habitual melancholy, his capacity for deep affection, his true patriotism, his patience, his modesty, and his entire freedom from professional jealousy—qualities which account fully for the tender and reverent esteem in which he was held by his friends and associates. In a word, this is an essay well worth the reading, for its style, which is exceedingly good, its justice, its continence, and its mastery of its subject.

—The small octavo entitled 'Modern Greece,' by Sir Richard C. Jebb (Macmillan), a reissue after some years, condenses in four essays a general view of the Greek Kingdom and the Greek question, historically, politically, and socially. The first paper is a masterly outline of the story of the Greek people from Alexander to our own time, presenting the transitions from Roman to Byzantine and Turkish rule with accuracy, vivacity, and eloquence. In spite of its brevity, it is full of color and picturesque detail. The second paper supplements this sketch with a picture of the general aspect and social conditions of the country as observed in a brief tour in 1878, containing many striking observations which the traveller will find true to his own recollections. The chapter on the progress of Greece, though written twenty years ago, contains very few pages that are now superseded. The recent war has of course, wrought some changes, particularly in Thessaly. The manufactories of which Professor Jebb speaks have been closed, in many places, on account of the high price of coal; and an active emigration has set in to the United States, which no one dreamed of in 1890. Agricultural conditions and appliances, however, have improved since the war, and agriculture must remain, as Professor Jebb concludes, the mainstay of the country. Another kind of harvest—that of Switzerland and the State of Maine—may be reaped every year, we believe, when the roads are improved and extended, if judicious Greek investors will plant and multiply convenient inns at suitable coigns of vantage. This would be no desecration of a region teeming with natural beauties and historic memories. The author's general view of the people and their institutions is penetrating, just, and hopeful, without being too optimistic. The chapter on Lord Byron at Mesolonghi completes this *aperçu* by giving a section out of the most critical period of the War of Independence. Byron had no prejudices against the Turks and no illusions with regard to the Greek people and character; yet he measured with accuracy and sobriety their political possibilities and their weight in the diplomacy of the Levant.

—Parts x., xi. of the 'Catalogo Generale della Libreria Italiana dall' anno 1847 a tutto il 1899' (Milan: Hoepli; New York: Lemcke & Buechner) conclude the first volume with the letter D, and contain the preface, which succinctly sets forth the aim of the work, its inclusions and exclusions, its rules of entry. The fourth of these rules has especial reference to the current instalments, and reads thus: "In the case of surnames preceded by the particles *da, de, di* (simple or conjoined), *du, von, van*, etc., if Italian, these prefixes are generally prefixed as they occur; if foreign, they are postfixed—still generally." One cannot quarrel with a method adopted by a foreigner to meet the needs of his countrymen, using his book of reference, but it seems strange to find here De Magny, De Maulde la Clavière, but not De Musset (and, of course, a host besides of French writers). English names are sometimes mishandled, as we have heretofore had occasion to point out, and in Part eleven "Dudley-Field" anticipates his natural appearance among the F's (with the prompt Italian translation in 1874 of his bulky 'Outlines of an International Code'). Before leaving the subject of entries, we remark that, by the omission of the son's name, the works of the elder and the younger Dumas are run together under a single rubric. The point of cleavage is discernible only from the alphabetization. Dumas *père* fills three pages, or six columns, and there is no cessation of Italian editions of his works, from 1851 to 1899. Dickens, on the other hand, with his minor works thrown in, claims but a single column, though going back to 1852. 'The Cricket on the Hearth' ('Il grillo del focolare') has been quite the most popular, numbering five editions, the latest in 1883. 'David Copperfield' has had two (1859, 1869); 'Oliver Twist' (1857), 'Our Mutual Friend' (1869), 'Hard Times' ('Tempi difficili,' 1877), 'Little Dorrit' (1878), 'Bleak House' ('La Casa triste,' 1885), one each. Nor has Dickens's 'Pictures from Italy' gone beyond a first translation. On the whole, while Dumas's 'Three Musketeers' was reissued in 1899, it would appear that the English novelist has passed his climax in Italy. Among Italian authors here exhibited, De Gubernatis is as fecund as any, filling a page. Much space is demanded for Deliberazioni, Disposizioni, Documenti, Dialoghi; Descrizione, Diario, Dizionario. One cannot praise too highly the industry, skill in condensation, and self-effacing modesty of the anonymous editors of this Catalogue.

GREEN'S LIFE OF CHATHAM.

William Pitt, Earl of Chatham, and the Growth and Division of the British Empire, 1708-1778. By Walford Davis Green, M.P. G. P. Putnam's Sons. 1901. Pp. xiii, 391.

Mr. Green in his excellent book tells us much, but not at all too much, of William Pitt's personal characteristics; for the peculiarities of Pitt's genius, and, above all, the extraordinary combination of matchless eloquence with equally unrivalled administrative ability, are the causes of his eminence among the long roll of English statesmen. But Mr. Green does not tell us much about the special conditions which at once enabled Pitt to display the marvellous powers conferred upon him by nature, and also, in the later part of his life, made it impossible for him to spend his talents in the service of his country. To imagine, indeed, with some pedants who call themselves philosophers, that genius is created by the requirements of a particular time, is to fall a victim to one of the idols of the cave. But, on the other hand, to fancy with the crowd that the effect of originality is independent of the conditions necessary for its operation, is to be misled by one of the commonest idols of the market-place; and it is the more necessary to note the intimate connection between Pitt's career and the special features of public life in England during the eighteenth century, because on this subject readers may be misled by a singularity of English constitutionalism. The forms of the English Constitution are in 1902 much the same as they were towards the end of the reign of George II. At the beginning of the twentieth century, as at the middle of the eighteenth century, we find in England a King, a Parliament which meets year by year, a Cabinet, a Government party, an Opposition, Tories and Whigs, and all the well-known paraphernalia of constitutional monarchy; and we are tempted to draw the inference that the Constitution of to-day is substantially the Constitution which existed during the lifetime of William Pitt. Every student, of course, knows that this idea is a delusion, and that the real continuity of English public life masks great changes in English institutions. Few, however, realize that innovations which have been gradual have amounted in the aggregate to a revolution; and that Pitt's career, in its triumph and in its failure, was determined by political circumstances which are now things of a past age.

The Parliament of the eighteenth century was an aristocratic Parliament. This one fact alone was in itself of immense advantage to Pitt. Under an aristocratic régime his position and his genius alike favored his rise to power. He was known, indeed, as the Great Commoner; but his connection with families such as the Stanhopes, the Grenvilles, and the Lyttletons sufficiently shows how closely linked he was with the nobility. The "Cobham cousinhood" might be described as an aristocratic clique. Pitt in a sense represented, but he did not in spirit belong to, the middle classes. When a commoner, no less than when an earl, he belonged to the nobility. He was able to avail himself of an advantage which is now not possessed by any Englishman. Without any special effort he could and did enter Parliament in early youth. He took his seat (one can hardly say he was "elected") for Old Sarum at the age of twenty-seven, or, to use the language of Mr. Green, there "occurred that paradoxical conjunction of the most famous representative of the people with the most notorious of rotten boroughs." There was, in truth, no paradox at all. Pitt entered Parliament as the representative, not of the people, who had not a word to say in the matter, but of the owner of the borough, in this case his brother. He became a leader of the people. But so also did many a man who sat for a rotten borough; indeed, in Pitt's case it was the possibility of entering Parliament without any real election which enabled him to become a popular leader. He began public life young—in itself an immense gain; and he began it unhampered by pledges to electors or by subscription to any party programme. If the anomalies, not to say the abuses, of the British Constitution opened for Pitt the doors of the House

of Commons, his special gifts exactly qualified him for eminence in the Parliament of his day. His eloquence, his appearance, his oratorical action, his crushing sarcasm—all the traits handed down mainly by tradition—are the characteristics of a man framed by nature to impress and lead an assembly where his audience delighted in rhetorical conflicts, where persons and personal influence told for much, and where, to speak plainly, rhetoric and personalities which were not spoilt by being reported in every morning newspaper, told for more than their real worth. A commanding presence, a grandiose imagination, combined with fiery passion and what has often been lacking to consummate orators—imperious strength of will—naturally marked out Pitt as the leader or the despot (he does not appear to have been ever the favorite) of a body such as was the House of Commons of 1757.

The parliaments, again, of the eighteenth century were far more political than legislative assemblies; they were concerned far less than the parliaments of to-day with law-making; they were much more vehemently concerned with policy. The fame of a Minister depended not upon carrying through acts of Parliament (with which, indeed, he might have very little to do), for few acts of a general character were passed, and the Government of the day was scarcely held responsible for such few as were carried. In truth, the course of events and an immense change in the current of opinion have during the nineteenth century carried the English Parliament from one extreme to another. In Chatham's time, and for more than fifty years later, English parliaments cared too little for legislation (whence arose the mass of abuses which had accumulated for generations, and in 1832 required at all costs to be removed), and cared, it may be, too much for policy. In 1902 the Parliament of the United Kingdom concerns itself, in appearance at least, very much with legislation, and, it may be argued, pays too little heed to policy. Whether this be so or not, it is certain that the preoccupation of Parliament and of England with policy, and especially with foreign policy, was most favorable to the authority of Pitt. His oratory was exactly suited for vehement party conflicts, and even more for keeping alive the high spirit of the country during a period of warfare. His resolution and his insight as an administrator then made him the creator of victory. His foes asserted—it may well have been a slander—that he purposely prolonged the conflict with France in order to keep up his own reputation. What is certainly true is, that times of warfare provided the best opportunity for the display of his genius. That he was the greatest of war ministers is certain; that he could have become, like his son, a great peace minister, is open to doubt.

The British Parliament was, further, in the age of Pitt, an emphatically English Parliament, and this in a sense in which the modern Parliament of the United Kingdom never can be a purely English assembly. For the British Parliament, though, since the union with Scotland, it had contained forty Scotch representatives, whose presence at Westminster added to the influence of the Crown, was for all essential purposes an English assembly, representing English feeling alone. The Reform Acts of the nineteenth century (accompanied, as they have been, by the rise of Nationalism) have done much more than lessen, it may be unduly, the representation of England at Westminster. They have created a complicated state of general opinion. A modern Minister must consider not only the opinion of England, but also the opinions of Scotland, of Ireland, and of Wales. England is, it is true, the "predominant partner," but a partnership is a different thing from a business belonging to one owner alone. The agent of a firm may find his action enfeebled because he must consult the wishes of more than one master. From this source of weakness Pitt was free; his wide views of public good made him throughout life resist the popular prejudice which desired to exclude Scotchmen from office and power, and he, more than any other statesman, welded England and Scotland into one nation. But the opinion of Great Britain, in so far as it reached Parliament, was, in England and Scotland alike, in reality English opinion; or, to put the thing in different words, British opinion was one thing throughout the whole of Great Britain. Pitt, therefore, was, especially in matters of foreign policy, the representative of an undivided and unhesitating national sentiment.

Mr. Green points out, and with truth, that Pitt's oratory displayed just the kind of eloquence which in earlier ages might have swayed the citizens of Athens or of Rome. He does not insist upon an equally important point, that the body of men who took an effective share in English public life, and who, for practical purposes, constituted the nation, and to whom Pitt appealed, bore a considerable resemblance to the citizens of a classical state. They were, compared to the whole of the population, few in number. They belonged to a limited class. They were guided by a few leaders who held in their own hands a large amount of political power; and this "legal country," to use an expression borrowed from France, was far more keenly interested in politics, and especially in party conflicts, than are to-day the huge mass of modern English electors. To this it may be added that the House of Commons, which represented this English nation constituting but a portion of the people, was, in spite of the corruption and intrigue that degraded Parliamentary life, more easily affected by eloquence than are the much more respectable parliaments of the twentieth century. Partisanship was violent, but party lines were not very sharply drawn. It is almost impossible to read the account of the effect produced by Pitt's oratory and sarcasm without coming to the conclusion that votes were at times more easily turned by the force of rhetoric in Pitt's day, and even at a later date, than in our own time. This idea is confirmed by observation of the results produced alike by the diatribes of Junius and by the advocacy of Erskine. A rhetorical generation was singularly amenable to the charm of eloquence.

But, if the conditions of the time afforded a field for the exercise of Pitt's genius, they also went a great way towards rendering it useless to his country. Many, no doubt, of the calamities which in the later part of his career Pitt was doomed to witness, but was unable to avert, may be attributed to circumstances which he himself, had he remained in power, could not in the long run have controlled. The miserable breakdown of his health, in 1766, was itself one of those terrible accidents which frustrate human foresight. It is impossible to insist too much or too often upon the ills which flowed from the dull obstinacy of George III. and the culpable pliancy of Lord North. Still, when everything is allowed for, the question remains, Why was it that, at a supreme crisis of national peril, the statesman who was still worshipped as the national hero, who had proved himself the most capable war minister England had ever seen, and who, whatever his faults, was felt by the people to be the most ardent of patriots, was not recalled to power? The answer is not hard to find. The unreformed Parliament of Great Britain had some striking merits. It more nearly represented the wishes of the nation than any one would have expected who, without a general knowledge of history, had simply examined the mode in which members of Parliament were elected; but the unreformed Parliament exhibited one fatal defect. No minister could hold or attain power unless he was supported by the influence (to use the expression of the time) either of the Crown or of a compact party who, from the possession of nomination boroughs, could appoint a large number of Members of Parliament. At the time of Pitt's triumphs, the alliance with the Duke of Newcastle, and also, in the last years of George the Second, the good will of the Court, gave him that permanent support in the House of Commons without which it was impossible to govern. In the later years of his life he was not supported by the united body of Whig nobles, and he was hated by the King, who considered him a "trumpet of sedition." George III., too, had become the greatest borough-monger in his kingdom; and, being endowed with the cunning or astuteness sometimes connected with insanity, showed exactly the kind of gifts which have occasionally made men of no breadth of view or real capacity the "bosses" of some American cities.

The system of government, then, which revealed Chatham's genius to the world, was also the system which led to the failure and the tragedy of Chatham's last years.

PATON'S SYRIA AND PALESTINE.

The Early History of Syria and Palestine. By Lewis Bayles Paton, Ph.D. Charles Scribner's Sons. 1901. Pp. xxxvi, 302.

This is a remarkably sane and discriminating treatment of a subject which, unfortunately, "gets on the imagination" of most of those who try to deal with it. The available material for the early history of Palestine is rather meagre, derived chiefly from Egyptian, Babylonian, and Assyrian inscriptions and from the Bible. How to use the latter, especially for the earlier periods, is in any case a difficult question, and the difficulty is greatly enhanced by theological prejudices. For Syria we have the same material as for Palestine, less the Bible; but on the other hand we have no theological prejudices to deal with. Professor Paton seems to have used to the full all available material, and it is surprising how much information he is able to piece together about times and countries whose remains are practically unexplored.

The earliest inhabitants, whose remains consist of megalithic monuments of the

Stone Age, he supposes to have belonged to the "so-called Kelto-Libyan race, which once occupied the entire coast of the Mediterranean," and to have been "ethnologically allied to the ancient Libyans and to the modern Kabyles of the mountains of Algeria." The first Babylonian inscriptions which mention expeditions as far westward as the Mediterranean Sea, fall about 3200 B. C., according to Professor Paton's conservative dating. From that on for about 1,200 years, we have a series of inscriptions showing that Syria and Palestine belonged to the ancient world of the Babylonians, politically—that is, in so far that various Babylonian kings claimed supremacy, levied tribute, and brought cedar from the Lebanon and Amanus mountains. Professor Paton believes that ethnologically, also, Syria and Palestine constituted an integral part of the ancient Babylonian world from the beginning of this period—that is, that they were occupied by Semitic peoples of the same stock as the Babylonians; but of this he adduces no proof other than the analogy of later times. More definite information as to the ethnological and linguistic affinities, at least of the Palestinian population, we begin to obtain in the latter half of the third millennium. It seems to be established that at that period the same or kindred peoples, moving northward from Arabia, entered Babylonia on the east and Palestine on the west. After this, successive waves of northward migration of Semitic peoples from Arabia can be traced, from the fourteenth pre-Christian century to the commencement of our era speaking Aramaic; after that, Arabic. Somewhat fanciful is Professor Paton's suggestion that Arabia bubbles over periodically at intervals about 1,000 years apart.

His treatment of the Hebrew race traditions is fresh and suggestive. Under his handling, the story of the twelve tribes of Israel, descended from two different wives and two concubines, handmaids to those wives, acquires real historical significance. Asher is mentioned in Egyptian inscriptions, before the time of the Hebrews, as a tribe or people somewhere in the northern part of Palestine, and hence, apparently, Canaanitic. After the Hebrew occupation, this tribe was admitted into the Hebrew twelve, but its origin is commemorated in the statement that it is a daughter of a concubine, a handmaid of Leah. The somewhat startling discovery some years since that the Egyptians knew certain Palestinian localities by the names Jacob-el and Joseph-el, when there were as yet no Israelites in the land, finds its explanation in those same Hebrew race traditions. Joseph (or Joseph-el, which is the same name with the divine suffix) was the ancient designation of that part of Palestine afterwards occupied by Ephraim and Manasseh. It was because those tribes settled in the land of Joseph that they came to be regarded as the children of Joseph. Similarly, in the Egyptian inscriptions the land east of the Jordan is designated as Ruten, which, in Semitic form, would be Lotan. This is the land of Lot, and Moab and Ammon became children of Lot because they occupied that territory. Israel and Jacob-el, or Jacob, were identified in a somewhat different relation, namely, as one and the same person, not as father and son.

The Babylonian divine names found in connection with Palestinian towns, mountains, and the like, in the Egyptian inscriptions, the Tel el-Amarna letters, and later in the Hebrew records, show that the Babylonian religion took root in Palestine during the long period of Babylonian supremacy. This religion the Hebrews found localized among the peoples of Canaan at the time of their occupation. Hence the similarity and at the same time the difference between the Hebrew and Babylonian creation, flood, and other myths. Professor Paton treats these subjects rationally, without theological bias, and yet without leaning backward. Hence one is the more ready to accept his somewhat conservative treatment of the famous fourteenth chapter of Genesis, with its story of the Elamite conquest of the Dead Sea cities, and of Abram and Melchizedek. This has been not infrequently regarded as a late Jewish romance, founded, perhaps, on old Babylonian material. Professor Paton regards it as "derived from a Canaanitish source, and as the earliest extant native document for the history of Palestine."

He makes, of course, full use of the Tel el-Amarna letters. The Suti and Khabiri, mentioned in those letters as invaders of Palestine, were the vanguard of that great Aramæan immigration from Arabia which finally overwhelmed all Syria and Mesopotamia. The Khabiri were Hebrews, not in the narrower sense in which we ordinarily use the name, but in that broader sense which includes also Moabites, Ammonites, and Edomites. Israel had not yet come into being. Somewhat later those tribes known afterwards as Joseph and Benjamin entered Egypt. The Leah tribes, Reuben, Judah, Simeon, Levi, etc., occupied at that time the region between Egypt and Palestine, having their headquarters at Kadesh-Barnea. This would explain the perplexing inscription of Merneptah, discovered in 1896, the only Egyptian monument on which Israel is mentioned. Here Israel is numbered among the peoples of Palestine and neighboring regions, whom Merneptah claims to have conquered. As a corollary of this explanation it follows, so Professor Paton thinks, that Merneptah was not the Pharaoh of the Exodus, which took place shortly after the time of Ramses III., about 1200 B. C.

Most fascinating is the account of the race movements which led to the settlement of the Philistines on the coast of Palestine at about the same time that the Israelites occupied the interior of the country; of those migrations from the north which brought the Hittites into Syria, and of the final occupation of the Hittite country by the Aramæans. Naturally, the book is fuller in its treatment of Palestine than of Syria, because in the Bible we have for Palestine, after the time of the Hebrew conquest, a considerable amount of native material, whereas from Syria we have almost nothing. Only one serious excavation has ever been undertaken there, namely, by the Germans, at the small mound of Zinjirli, in the extreme northwest, where were found the remains of a Hittite city, conquered later by the Aramæans and then by the Assyrians. Here and in some neighboring villages were found the most ancient Aramæan inscriptions yet discovered.

In only one matter of considerable importance do we feel inclined seriously to criticise Professor Paton's conclusions. He has followed the extraordinary theory of Stade, developed more fully by Budde, that the ethical character of the Hebrew religion was due to the fact that Yahaweh was not the ancestral god of the Hebrews, but "was the god of Sinai and of Midian, who had come into connection with Israel only through his own free, moral choice." This, it seems to us, is almost an absurd proposition on the face of it. It is impossible to interpret such religious movements as those of Moses, or Zoroaster, or Buddha, or Mohammed without recognizing the supreme importance of the leader who towers above his people. It is in him and his conceptions that the historian must look for the introduction of that ethical element which differentiates all these religions from the religions of the peoples about, not in a free moral choice of a god who was not an ancestral god. Incidentally Professor Paton has adduced some curious monumental evidence to discredit his own theory. The Aramæan tribes who settled at Zinjirli and its neighborhood, belonged to the vanguard of the Aramæan invasion, as did the Hebrews. Hence it is that we find them speaking a language so closely allied to Hebrew that it is almost doubtful whether it should be classed as Aramæan or Hebrew. Now these north Syrian peoples, so closely allied to the Hebrews, worshipped a divinity of the name Yahu, as appears by their proper names, and even called themselves Ya'udi or Yahudi, as did the Jews. But Yahu is only another form of Yahaweh, the ineffable divine name of the Jews, whence it would appear that, in religion as in language, Jew and north Syrian were closely related from ancestral times.

There are valuable chronological lists at the beginning of this little book, and an extensive bibliography, extremely useful to the student. A few sketch maps here and there through the volume are useful for suggesting to the eye the distribution of peoples and nations at various periods, according to Egyptian, Babylonian, and Assyrian inscriptions. Such maps must, however, be regarded as mere suggestions. The book is eminently readable, as well as scientifically valuable. It belongs to the "Semitic Series," the general editor of which is Professor Craig of the University of Michigan. If the remaining volumes of this series shall approximate the standard set by this work, the series will be extremely valuable both to Bible scholars and to students of history in general.

LETTERS OF A LOYALIST.

Letters of James Murray, Loyalist. Edited by Nina Moore Tiffany, assisted by Susan I. Lesley. 1901. For sale by W. B. Clarke Co., Boston.

Though this volume is "privately printed," let us be forward to declare that the editors stand in no need of holding up a shield for protection. It is small praise to say, as it deserves to be said, that they have done their work exceptionally well. What they furnish as explanatory text is written in a clear and sprightly style, and pervaded by an air of refinement. It is because of a judicious treatment of material in itself not of literary worth, that these pages can be recommended to the general reader as an attractive narrative and a valuable contribution to our colonial history.

James Murray (1713-1782) was a Scotchman who, being, as Johnson would have it, "caught young," went to London to learn the mysteries of West India trade. Getting his patrimony in 1735, when only twenty-two years of age, he started with it and his sister Barbara, then eighteen, for America to seek his fortune. Upon arriving at Charleston, South Carolina, the good people there tried to dissuade him from pushing on to the Cape Fear region of the other Carolina, his point of destination; but Murray made his way to the newer settlement and cast in his lot there. He would have established himself at New Town (now Wilmington), only there was no house there, so he went to Brunswick for a while, and later, when New Town had taken on a visible shape, he transferred himself to that port. Young Murray had to do with land and negroes, together with pitch, tar, and turpentine, being the proprietor of a general store and keen at trading. Though not in love with his surroundings, he stuck to his calling, and, by the exercise of Scotch thrift, managed to make a living if not to prosper. He became Collector of the Port, and, during Gov. Johnston's term, was a member of the Board of Councillors. These public services, however, were not very exacting or important. There are several letters from North Carolina, which, though meagre in detail, cover a period in respect to which almost any original matter must be welcome to the local historian. Mr. Murray handles the pen after a business fashion. His letters are plain, simple compositions which reflect the life, rude and simple, of those early times.

Barbara, it seems, found a husband in less than two years after their arrival. James Murray had another sister, Elizabeth, a bright, energetic young woman, who came to North Carolina, then went back to Scotland, and in 1749 landed at Boston and began the business there of selling articles of female apparel—what would probably now be called millinery. Elizabeth Murray was married to three successive husbands, Campbell, Smith, and Inman. She may be called the heroine of the narrative. In 1765 James Murray removed from North Carolina to that "poor healthy place," as he had styled it, New England. James Smith, husband to Elizabeth, was then carrying on the business of a sugar baker, and had made a fortune at it. He lived on Queen Street, near his sugar house on Brattle Street. He also owned a mansion house at Brush Hill, Milton. Smith died in 1769. His widow, after tarrying a while in Scotland, returned to Boston, and was married to Ralph Inman, "who kept his coach and liveried servants," and owned a large house in Cambridge. James Murray we find later living on the farm at Brush Hill, and trying his hand at the sugar business, as a successor of his brother-in-law.

The year of this change from North Carolina to Boston was marked by the sacking of Gov. Hutchinson's house, and the loss of those precious manuscripts which the antiquarian takes so much to heart and never ceases to deplore. The agitation that finally culminated in the Revolution was stirring Boston. Murray sided with the King. He was a Tory, or, as the editors prefer to soften the term on the title-page, a Loyalist. His letters upon business and upon family matters necessarily speak, yet guardedly, of the political disturbances to which he was witness. The British regiment of which a portion took part in the Boston massacre, was quartered at Murray's sugar house. An account of the massacre is given in one of these letters.

Mr. Murray had two daughters, Dorothy (1745-1811), who married the Rev. John Forbes, from whom was descended an honored citizen of Milton, the late John Murray Forbes, her grandson. The other daughter was Elizabeth Murray (1756-1837), who was married to Edward Hutchinson Robbins. It was upon the decease of James Murray Robbins, grandson of Elizabeth, that these letters, found in the Brush Hill mansion, could be arranged for being put into print. Murray stayed in Boston until the evacuation by Howe, and sailed for Halifax in company with the troops. There are numerous letters that throw light upon the condition of affairs in the besieged city. One may read an expression of fear and anxiety on the part of loyal adherents to the King, and then, by turning to a letter of Abigail Adams, of identical date, written just outside of Boston, may share in a similar feeling that agitated the patriot women.

The following interesting extract is from a letter written by Elizabeth Murray to her sister Dorothy Forbes. The prisoners referred to were Highlanders, captured on a transport in Boston harbor:

"Boston June 11 1776 Tuesday afternoon, 5 o'clock, not Dressed.

"Dear sister—Fenwick carries you a Barrel of Rum, which is 26/ the Gallon. . . .

"We turned about, and what was [our] surprize to see four Officers with a gaurd. Prudence had told me the Duchess of Gordon's Brother (whose name I knew to be Maxwell) was a Prisoner. That, and the great anxiety I was in for our Uncle, occasioned a wish to speak to them. The first three I had not resolution to stop, but went up to the last and asked the favor of being answered one question, and with a faultering Voice asked if the first Battalion was come out to America. All the Gentlemen turned round when I stopt the last. They informed [me] that Regiment was in England, and to remain there. Joyful sound it was to me. Still trembling so as to be incapable of supporting without Prudence's assistance, I asked if either of them Gentlemen were Capt. Maxwell. A lovely Youth, who appeared to be about twenty, Bowed an acknowledgment of that Name. I enquired for his Mother and Sisters, who he told me he left well in Scotland six weeks ago. Here my voice failed, and we all remained in silence for the space of a minute, and parted without another word. 'Tis in vain to attempt a discription of my emotions, at that moment. We went on, and they went to the jail to take leave of their Men, who are to be sent back into the Country to work for their living and it is expected will join the American army" (page 242).

We remark that, in the eighteenth line of the above extract, the editors have inserted "[me]" as if supplying an accidental omission on the writer's part. But we have no doubt that "inform" was here used in the intransitive sense of 'report' current in the seventeenth century, and which we have found yet lingering colloquially in this country. The absence of the conjunction *that* corroborates this view. The sentence, properly punctuated, would read (as spoken, with a pause after the verb): "They informed: that Regiment was in England," etc.

Of manners and customs there are naturally many glimpses, and something may be gleaned in words and phrases for the Oxford Dictionary. The familiar Southern correlation of "hog and hominy" Dr. Murray quotes first from Bartlett, "about 1860"; but it was in vogue before the Revolution. For example, the patriot, William Hooper, in writing from Baltimore, April 2, 1776, to Dorothy Forbes, employs this American symbol of tranquil content in conjunction with the Scriptural (p. 239). We copy literally, though the sentence is rather disjointed:

"I wish for peace, that we may once more under our own Vines and Fig trees enjoy the blessing of domestick peace, that I might enjoy in my own Cabin, eat my Hogg & Hominee without anything to make me afraid."

James Murray, after leaving Boston, never saw his children again, though he ventured as near them as Newport and New York. A few letters written to them from his place of exile are to be found in this volume. He died at Halifax in 1782. While the female correspondents show (as is proverbial with their sex) a superiority in the art of letter-writing, this steadfast old gentleman remains the central figure of the history, of which these pages treat. The reader is likely to conclude from them and from his portrait, which faces the title-page, that he was a man of estimable qualities, and that his loyalty to his sovereign, viewed at this distance of time, may well be entitled to our respect.

We discharge an obvious duty to any reader of this volume by urging him to pursue the Murray family history, first in Mrs. Lesley's perennially charming 'Recollections of My Mother [Anne Jean (Robbins) Lyman, granddaughter of James Murray],' and Mrs. Hughes's inspiring Memoirs of her father, John Murray Forbes, great-grandson of James Murray. We do not recall, at this moment, any corresponding exhibition of a great family connection; in narratives, too, of quite unpremeditated interlacing, and which, finally, might be extended for other branches without diminishing the honorable esteem exacted by the lives already set before us.

English Coronation Records. Edited by Leopold G. Wickham Legg, New College, Oxford. Whitehall: Archibald Constable & Co.; New York: E. P. Dutton & Co. 1901.

As a premonitory symptom of King Edward's coronation, there comes to us a sumptuous volume which deals with royal crownings in the past. One need not expect to find in it any discussion of first principles—of *Dei gratia* versus parliamentary title—for it simply contains an account of the rites and ceremonies by which English sovereigns have been consecrated since the days of the Heptarchy. At least this is the main subject, and all else is accessory to it. Even with such a restricted scope the book contains a great deal of material. In the Middle Ages, when election meant far less than it does now and the formal consecration meant far more, the details of this important ceremony were studied with the utmost care. The *forma et modus* was not stereotyped, but underwent considerable change and development. As time went on, it naturally became more elaborate. Recension after recension was made, until, in the reign of Edward II., the *Liber regalis* appeared. When the short

rubrics of this ritual have been expanded into the long rubrics which were used at the coronation of Richard II., we get the mediæval coronation service in its perfection; and Mr. Legg, by publishing the full text, puts us in possession of a really important document.

A book of this kind appeals to three distinct classes of persons: to the historian, to the antiquary, and to the lover of pageants. The members of the latter class are numerous, whereas the historians and the antiquaries are comparatively few. Those who look upon the coronation service as a religious rite of high sanctity are fewer still, for, as Mr. Legg implies, the public attitude of mind was considerably affected by the Revolution of 1688. "Since the end of the seventeenth century the service has gradually fallen into neglect, so that even at the present day the great mass of people look forward to it rather as a pageant arranged for their amusement than as the solemn inauguration of their sovereign in the throne of his Government." The antiquary will find much in this volume about the panneter, who carried the salt-cellar and knives to the king's table; about the coronation spoon and the regalia; about the cap of maintenance, and about the King's champion, Dymock of Scrivelsby. The celebrated conservatism of England is still shown in many singular and interesting usages which accompany the solemn act of crowning.

But as the enthusiastic pageant lover will attend the coronation, and as professional antiquaries in America are few, we shall merely indicate one or two features of Mr. Legg's compilation which are likely to attract the notice of the historian. In the first place, there is a long and valuable introduction, wherein may be found a broad survey of English coronations as a whole. Then come the documents which, though largely liturgical in character, comprise some letters and inventories of general interest. Among these may be mentioned two letters from Pope Alexander III. to the Archbishop of York, forbidding him to crown a king of England without leave of the Church of Canterbury; a letter of Pope John XXII. to Edward II., relating the circumstances under which the sacred oil of coronation was given to Thomas Becket; the Court of Claims of Richard II.; and a long list of the articles which were deemed necessary for the coronation of Henry VII. To this inventory of Tudor magnificence is appended the cost of each article; and numerous statistics regarding the wages paid to workmen of all degrees are also furnished. If the approaching coronation is marked by the same splendor which attended that of the triumphant Lancastrian, the ambassadors and sight-seers in attendance will have no cause to grumble at their entertainment.

Although the interest of Mr. Legg's records is largely liturgical, the work deserves to have a place in the library of the historian. The illustrations are well executed, and, in fact, all the mechanical features respond to the dignity of the subject.

Jane Austen, her Homes and her Friends. By Constance Hill. London and New York: John Lane.

When Miss Austen's Elizabeth Bennet walked across country three miles to inquire for her sister Jane, her appearance in the breakfast parlor at Netherfield Park created polite consternation. Miss Bingley expressed her disapproval memorably:

"To walk three miles, or four miles, or five miles, or whatever it is, above her ankles in dirt, and alone, quite alone! What could she mean by it? It seems to me to show an abominable sort of conceited independence, a most country-town indifference to decorum."

Between the moment of Miss Bingley's censure and that of publication of Miss Hill's book, enterprising Elizabeths have won for their sex several inestimable privileges, among them that of going about alone, quite alone! And whether the object be to see a sick sister or to gather material for a book, the unattended maiden pursues her way; exciting neither suspicion nor reproach.

Poor Miss Bingley! The veil hanging between her and a scandalous future was fortunately opaque; she was borne with propriety to the family vault, undisturbed by visions of the dreadful things that maidens would be doing at the end of her century, and (irony of circumstance) doing even in the home of the author of her being. For it was the charm of Jane Austen's rendering of that society of which Miss Bingley was an ornament, that impelled the Misses Hill (unattended) to wander over several counties of England, exploring lovely lanes and secluded parks, putting up at wayside inns, talking eagerly to any sort of person who might furnish a scrap of information about the famous novelist.

In addition to a "determination to find out all that could be known of her life and its surroundings," the ladies wished to "trace the connection between the author's individual experience and that of the personages in her novels." They have succeeded, not only in connecting the real and the fictitious, but in occasionally confounding them, so that a reader not very familiar with Miss Austen's works is not unlikely to be more puzzled than enlightened by some parts of the narration. Nothing of importance is added to the facts about Miss Austen already known; but, by combining with descriptions of places where she lived well-chosen excerpts from her novels and letters, from family papers and published memoirs, her life and character have been presented distinctly, and on the whole vividly. It was at Steventon that the ladies came nearest to personal contact with their idol, when they talked to an old man, named Littlewart, whose mother had been "Miss Jane's" goddaughter. Littlewart pointed out a pump standing over a well from which the Austens used to draw water, and the sight moved the pilgrims to exclamatory delight.

Frankly taking the attitude of an adorer, Miss Hill offers no critical comment, nor does she cite any that is not eulogistic. But she rather skilfully contrives to assure us that, if Miss Austen did not put all she knew about life into her books, she never put anything that she did not know. Her own life even in detail was the foundation for all that she wrote. She moved in a society well ordered and refined, a society that did not encourage violent emotion, and was scrupulous about making calls. By no merit of its own has this society survived itself and remained perhaps more intimately and exactly known than that of any period of our history, but because there happened to be born in its sacred centre a woman with genius perfectly adapted to give to its actual transient existence literary perpetuity. The sketches made by Miss Ellen Hill and reproductions of family portraits add to the value and attractiveness of her sister's text.

A Selection from the Comedies of Marivaux. Edited, with an introduction and notes, by Everett Ward Olmsted, Professor in Cornell University. The Macmillan Co.

Marivaux had to wait until the latter part of the nineteenth century to receive from his own country the full recognition to which he was entitled. Although the subject of many an interesting chapter of literary criticism, he remained one of those minor writers whom the average reader feels content with knowing only by name. About 1880 a reaction set in, and Marivaux began to be better appreciated. In that very year the French Academy proposed his name for one of its literary contests known as the Prizes of Eloquence. In 1882, a huge thesis for the doctorate was presented to the Sorbonne by Mr. Gustave Larroumet, the now famous professor and critic, who deemed 640 pages not too many to exhaust the subject. This was the signal for a revival of interest in Marivaux. All the representative critics fell into line. The theatres gave more attention than heretofore to his plays, and some of his comedies, which belonged to the repertory of the Comédie-Française, have never since disappeared from its boards. Not many weeks ago the Odéon was giving his "L'École des Mères," and Marivaux, whom M. Faguet considers "the most original of the French comic authors" after Molière and Beaumarchais, has come to be to-day as popular as either one of them.

It was about time that the American public should be enabled to know something of so charming and so representative a dramatist, who not merely created a new *genre*, but whose very name gave birth to a new word in the French language, *marivaudage*, defining a thing Marivaux did not invent, but to which he gave a delicacy of form nobody ever equalled, either before or after him. Strangely enough, Marivaux has been until now unedited in this country, and, one may say, practically unknown. Therefore, this selection which Professor Olmsted presents to all students of French supplies a long-felt need.

In many respects it is one of the most satisfactory editions of French classics that have been published for a long time. The choice of the three plays, which are all printed without abridgment, is both judicious and happy. They are the three most famous and characteristic of Marivaux's comedies: "Le Jeu de l'Amour et du Hasard," "Le Legs," and "Les Fausses Confidences." In all three the reader will find all the traits, good and bad, of the author's peculiar style, his sparkling wit, subtle badinage, and also his often far-fetched and odd preciosities. Of course, such a style constitutes a text not always very easy to understand, even for natives, although it is in the main of the best eighteenth-century clearness and purity. The editor has taken pains to ex-

plain all the passages which are obscure and would be even unintelligible with a mere knowledge of modern French. The notes are not content to explain what the teacher in the class-room might have made clear himself. Perhaps some of Mr. Olmsted's interpretations are open to discussion, as was likely to be the case with an author so fond of queer expressions, and whose vocabulary is half classical and half modern. Thus, for instance, we do not see any reason for giving a seventeenth-century meaning to the word *impertinence* in so simple a sentence as this one: "Allez répondre vos impertinences ailleurs" (p. 3). Nevertheless, the notes, as a whole, will be found to be both helpful for the understanding of the text and instructive in regard to the customs and manners of the society which Marivaux depicts.

The last and not least feature of this edition is the long introduction of 80 pages (it could have been shortened by 20 without loss) in which the editor gives an interesting and complete sketch of Marivaux, not merely as an author of comedies, but as a novelist, a moralist, and a newspaper-writer as well. These latter qualifications, being less known, were well worth dwelling upon, although his 'Marianne' and 'Paysan Parvenu' are no longer read, and his journalistic activity in *Le Spectateur Français* is quite forgotten. For this study Mr. Olmsted has made abundant, intelligent, and discriminating use of all the works published on his author by contemporary writers like Palissot and D'Alembert, or by critics of to-day like Larroumet, Faguet, and Deschamps. His essay is a most fitting introduction to an edition whose conscientious and scholarly qualities will no doubt receive from all lovers of French literature the reward which they deserve.

Dictionary of Philosophy and Psychology. Edited by James Mark Baldwin. Volume I. The Macmillan Co. Pp. xxiv, 644.

This volume is the first fruits of more than seven years' generous labor on the part of what the editor terms aptly "an international committee." When complete, it will consist of two volumes of definitions and one volume of bibliography, the last including not only a list of the recognized books under each article, but also a list of the best contributions to technical periodicals. In the first two volumes the articles are of three sorts: first, concise definitions; second, such definitions, with the addition of historical and expository matter running to several hundred words; third, special articles, of from one to five thousand words, which one would more naturally expect to find in an encyclopædia than in a dictionary.

The articles of the last two classes, which make up the bulk of the book, are of great value, and are admirably well done. Not only the beginner but the serious student in philosophy and psychology may well be glad to have at hand a book that contains the history of current philosophical and psychological terms. Philosophy and psychology are, quite as much as law, if not, indeed, as biology, written in a language apart, and the absence of a lexicon has been an anomaly. The present work deals also, or is to deal, with "many of the principal conceptions of ethics, logic, æsthetics, philosophy of religion, mental pathology, anthropology, biology, neurology, physiology, economics, political and social philosophy, philology, physical science, and education," giving technical equivalents of the English terms in French, German, and Italian, and supplementing the text with woodcuts and bibliographies. The limitation of the book lies on the side of the technical terms of Greek and scholastic philosophy. These the editor and his staff have reluctantly refrained from any attempt to deal with exhaustively, though considerable information is given in the text about Greek and scholastic philosophy and its terminology.

The present volume includes articles from *A* to *Law*. The only adverse criticism in general to be made on it is, that it gives the definition of many words which are not technical, and to the definition of which special sciences have as yet no precision to lend. It is out of place to set down in a lexicon of technical terms that Joy is "a pleasurable emotional state accompanying consciousness of gain or advantage to oneself or another." Joy, says Dr. Johnson, is "the passion produced by any happy accident; gladness, exultation"—which, by the way, less strictly than the previous definition, excludes *la joie de vivre*.

An Introduction to the Industrial and Social History of England. By Edward P. Cheyney, Professor of European History in the University of Pennsylvania. The Macmillan Co. 1901. 8vo, pp. x, 317. Illustrated.

This is an excellent book for teaching purposes. If it is not marked by quite so vigorous and easily flowing a style as Mr. Townsend Warner's 'Landmarks in English Industrial History,' which is its only rival, it shows more independence and personal knowledge of the original sources. Moreover, as the work of an American teacher, it is better adapted to the average mental outfit of the American student; and it takes care to include about as much of the political history of England as is absolutely necessary for the understanding of the social development. The first half is much superior to the second. Here Mr. Cheyney is at home in his subject. Many teachers must have felt grateful for the convenient little collections of manorial and municipal documents which he prepared a few years ago for the use of his pupils in the University of Pennsylvania; and the question of mediæval agrarian history is one in which he has himself been keenly interested. He presents the conclusions of the best recent investigations; and where his opinions differ from those of the present reviewer there is doubtless a good deal to be said for Mr. Cheyney's views.

A few slips may be noticed in the interests of the next edition. At page 117, line 10, "town" should be "university." The reference on page 124 to the non-existence of villenage in Kent should be more guarded—see Vinogradoff (p. 205) and Trevelyan, 'Age of Wycliffe' (p. 219). The phrase on page 139 about the appointment of bishops countenances the common, but mistaken, notion that the Reformation introduced a great practical change in this respect; but see Stubbs, section 386. And on page 143, line 10 from bottom, Bryán C. J. should be Danby. Where the book is relatively weak is in the later chapters, especially the last two. The history of Factory Legislation, Trade Unionism, and Coöperation is important enough; but it is by no means the whole of the industrial history of England in the nineteenth century. This is a weakness not peculiar to Professor Cheyney's book, but marks a good deal of the teaching of industrial or economic history. But if the treatment of the post-mediæval centuries is to compare in thoroughness with the treatment of the mediæval, there must be far more attention given to the distribution of the great industries and to the effect of mechanical advances in transportation and production than has hitherto been usual.

The illustrations have been selected with judgment, and most of them have the great merit of illustrating. But the Hall at York, of which pictures are given on pages 60, 62, in the sections on the Gild Merchant, is the hall of the sixteenth century "Company of Merchants, Mercers, Grocers, Apothecaries and Ironmongers," which *may* indeed, be descended from an earlier gild merchant, though that remains to be proved. And in the Trade Routes map, on page 85, the absence of boundaries to Muscovy may cause some natural misapprehension; while the insertion of "German" before "Empire" and the total absence of Constantinople might give just offence to the soul of Mr. Freeman.

Classification, Theoretical and Practical. I. The Order of the Sciences; II. The Classification of Books. By Ernest Cushing Richardson. Charles Scribner's Sons. 1901. 12mo, pp. 248.

We should hesitate to recommend this book to a beginner in the subject; but one who knows what is usually said about it will find Mr. Richardson's absolute independence of all that, refreshing. He does not argue much, but his dicta are dynamitic. For instance, he holds that, in order to be a subject of classification, a thing must have separate existence. This is sufficiently surprising; but upon this statement immediately follows another even more radical, to wit: "Ideas are therefore the subjects of classification just as much as anything else not only because they have a material as well as a spiritual substance but because they are individual separate things existing in a certain place at a certain time in a certain definable nature." (The non-punctuation is not ours.) Whether the man who writes so has read, may be doubted, but he has certainly thought. The same fact is evinced in his definitions. "*Likeness*, as the ground of the putting together of things in classification is, in brief terms, interchangeability." If this writer would only subject himself to some Socratic dialogues with a logical sharp, we do not doubt that his analytic powers would ultimately become very useful to his profession of librarian. But it cannot be that he should at present produce a good classification of subjects of books, because he would be governed by conceptions that not only are unfamiliar to those who would consult his catalogue, but are also untenable in themselves. As for his classification of sciences, we may possibly have seen worse ones.

It is, however, the Appendix to the book, which fills more than half again as many pages as the body of the text, that is the really useful part of it. This consists of

lists of references to systems of classification of sciences and of books. Of course, it cannot be complete. There is, for instance, no reference to the Century Dictionary under *Science*. The tables do not evince great learning, but they must prove highly useful.

The Elements of Architecture, Collected by Henry Wotton, Kt., from the best Authors and Examples. Springfield, Mass.: The F. A. Bassette Co. 1901.

At the instance of Mr. Guy Kirkham, Architect, there has been reprinted in facsimile, from the edition of 1651, that part of the 'Reliquiæ Wottonianæ' which relates to architecture. Preceding the special title quoted above, comes a facsimile of the quaint general title of the work, which reads, 'Reliquiæ Wottonianæ, or, A Collection of Lives, Letters, Poems; with Characters of Sundry Personages; and Other Incomparable Pieces of Language and Art. By the curious Pensil of the ever Memorial Sr. Henry Wotton, Kt., Late Provost of Eton Colledg. London, 1651.' The elements of architecture were, in the days of Wotton, a part of the education of a gentleman; and as a gentleman, and not as a practitioner of the art, he approaches his subject. He had travelled in Italy, he had read his Vitruvius; his equipment was complete. What he wrote, especially if read in its original setting of curious old type, with every noun capitalized and every important word italicised, is, at least for an architect, matter most diverting. His strange embodiment, in unfamiliar language, of ideas full of common sense, yet of singular inexactness, is the kind of thing one rarely comes upon nowadays. As an example of his style and matter, let us quote the opening sentences: "In *Architecture* as in all other *Operative* Arts, the *End* must direct the *Operation*. The *End* is to build well. *Wel-building* hath three Conditions, *Commodity*, *Firmnesse*, and *Delight*." He proceeds with a discourse upon "The *Seat* and the *Work*," and, in describing the construction of the work he reaches the most delightful heights of inconsequence.

Your bibliophile needs Sir Henry Wotton in an early edition, but the busy architect will be content to divert the tedium of a half-hour's enforced idleness by perusing his thoughts on architecture in so excellent a reprint as that of Mr. Guy Kirkham.

BOOKS OF THE WEEK.

Alden, R. M. Shakspere's Tragedy of Julius Cæsar. Boston: Benj. H. Sanborn & Co. 25 cents.

GINN & COMPANY, Publishers
Boston, New York, Chicago, London.

The BOOK *for* PRINCE HENRY

PRINCE HENRY OF PRUSSIA, when calling recently at the American Embassy at Berlin, to obtain from Mr. White information concerning the best literature on American Life and Customs, was recommended to read Bryce's famous "Commonwealth" and James F. Muirhead's

AMERICA
***The* LAND *of* CONTRASTS**

BEING A BRITON'S VIEW OF HIS AMERICAN KIN

New Edition. 12mo, $1.20 net

The author is well fitted to write on American Life and Customs, being a much "travelled" man whose wife is a member of a well-known Boston family. Indeed, his book is gallantly dedicated "To the Land that has Given me what makes Life most worth Living."

A MISAPPREHENSION CORRECTED

The publisher wishes to correct an erroneous impression which seems to be gaining credence with regard to Richard Bagot's novel, "Casting of Nets." It is not written in condemnation of Roman Catholicism; on the contrary, the author is himself a Roman Catholic, who has spent much of his life in Rome, and who is therefore thoroughly conversant with Roman influence. His purpose is to expose (as, indeed, did Dante himself) **the fallacious theory of the temporal supremacy of the Vicar of Christ.** The Pope, he argues, weakens the power of his spiritual heritage by grasping at a worldly power he was never intended to wield.

CASTING OF NETS

By RICHARD BAGOT

12mo, $1.50

CANON SCOTT-HOLLAND, preaching at St. Paul's Cathedral, London: "A book widely read of late, a book of singular brilliancy."

RABBI KRAUSKOPF: "The story is excellently written: it holds the reader spellbound from first to last. It is a strongly purposive book. The author deals with facts, the names are but guises of actual personages well known in aristocratic circles in England and in Rome."

JOHN LANE THE BODLEY HEAD 67 FIFTH AVENUE **NEW YORK**

RECONSTRUCTION and the CONSTITUTION

Completing the American History Series

By JOHN W. BURGESS, Ph.D., LL.D.,

Professor of Political Science and Constitutional Law and Dean of the Faculty of Political Science in Columbia University, also author of "The Civil War and the Constitution."

THIS volume brings the history of the United States down to the inauguration of President Hayes and the restoration of self-government to the South by the withdrawal of troops from that section. It is a careful record, with illuminating commentary, of the momentous events and legislation of the whole Reconstruction epoch, together with a searching examination of the Presidential and Congressional plans of Reconstruction from the point of view of constitutional law.

$1.00 *net*

THE AMERICAN HISTORY SERIES (Complete with the above)

AMERICAN BOOK COMPANY
Washington Square - New York

SCHOOL TRUSTEES, PRINCIPALS, TEACHERS,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

The *Nation*, in its special field of political and literary criticism, is unlike any other periodical, American or foreign. About 10,000 copies are circulated weekly, but these figures do not accurately represent the number of its readers. It is taken by reading clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Advertising rates, 15 cents a line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

The Nation.

NEW YORK, THURSDAY, MARCH 6, 1902.

The Week.

Whatever discredit—and it is undeniably great—attaches to the continued playing fast and loose with Cuba, must be, so far, charged up to the Republican party and its leaders in Washington. They have ostentatiously made it their own affair. It is the Republican members only of the Ways and Means Committee who meet to frame the bill which remains so distressingly unframed. The "continuous performance" of a caucus to settle the matter is wholly a Republican show. The Democrats, in fact, stand ready to do more than Cuba asks. They would vote for absolute free trade with the island. It is the Republican party which has, in all this Cuban quandary, got on a conspicuous stage to exhibit to the country a disheartening spectacle of vacillation, divided counsels, and feeble-minded leadership facing both ways. Could the immense talent for blundering which the Democratic party possesses have surpassed this display? We doubt it. Republican jeers used to be addressed, and with much reason, to the distracted Democracy, when it was wrestling with the Wilson tariff or the silver question. "Why don't the two wings of your party flap together?" That was a common taunt. But what are the Republican wings just now, and how are they flapping? How high can a party soar when one of its wings has beets in the place of feathers, and, even so, flaps hopelessly at variance with the other? These are the questions which political observers are beginning to ask, as they see the Republicans marking time at Washington while the country is crying out for action.

Unpleasant stories come from Havana of planters being forced to sell out to American capitalists, and of the agents of the latter boasting that they are "working" Congress so as to delay relief for Cuba and still further depress real estate in the island. It is not necessary to credit all these tales, yet they undoubtedly represent to the Cubans a very sinister side of the American occupation. Bargains in land secured by ruining the owners are not agreeable to think of, and we cannot wonder that the Cubans are angry and suspicious at the unaccountable procrastination of the House Republicans, or that they are almost inclined to despair of anything being done for them at all. But there is no real reason for them to despond utterly. The delay is vexatious, it is disgraceful to the House leaders responsible for it, but it will be ended, sooner or later. The President is firm, the Senate is ready to act. In the end, the reluctant and squabbling Republicans of the House will fall into line, hating to do so as they will. We only trust that deferred hope will not make the Cubans sick at heart, and that the bankers and merchants of Havana will have faith enough in the honesty of the American people to extend credits, and so avert that bankruptcy and misery which the dilatory House is doing its best to bring upon the island.

Express authority is by the Constitution given to each house of Congress to "punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member." Immediately after the controversy of Saturday week two-thirds of the Senators present (if a quorum) might have turned Tillman and McLaurin out of their seats, and the same proportion of the body may do this to-day or at any other time. That would end the service of each under his present commission. But the Constitution says nothing about suspending a Senator—that is, debarring him from service for a longer or shorter period. It is argued that suspension may be considered one form of that punishment for disorderly behavior which can be inflicted, and the contention seems a strong one at first thought; but it soon appears that the other party in issue—the State from which the Senator comes—has rights in the matter, which are denied by suspension. Mr. Bailey of Texas, on Monday, made an argument against the claim that the Senate may suspend its members, which not only demonstrated his ability as a reasoner, but also impressed the majority so strongly that Mr. Frye the next day ordered the names of Tillman and McLaurin restored to the roll, and it is evident that many Republicans now doubt whether the Senate, as a body, can legitimately exercise this power. Mr. Bailey stands upon the provision of the Constitution that "no State, without its consent, shall be deprived of its equal suffrage in the Senate." If Tillman and McLaurin are prevented by a majority of their colleagues from acting as Senators, South Carolina is obviously denied its proper share in the action of the upper branch.

But would not the expulsion of one or both also deprive their State of its equal suffrage in the Senate? Only until a successor or successors could be elected by the Legislature, or named by the Governor, if the Legislature were not in session. Moreover, expulsion is expressly authorized by the Constitution, and, therefore, the temporary loss of representation for the State which it may involve cannot be regarded as conflicting with the provision that it shall not be deprived of its equal suffrage in the Senate. Suspension, however, would prevent representation of the State by the member suspended, while the State would be denied an opportunity to send somebody else in his stead, as in the case of expulsion. The power of suspension, if it exists, is obviously unlimited. The practice of college faculties might be imitated—suspension for a fortnight, in case of a minor offence; for six weeks, if more serious; for the remainder of a long session of Congress, if the misdemeanor were especially flagrant. Meanwhile, the State would lie helpless at the mercy of a mere majority of the Senate – unable to speak or vote through the man of its original choice, and prevented from making a new choice. It is plain that this principle cannot be admitted. It would be very perilous in the quietest of times. In a period when party passion might run high, and when the dominant organization, perhaps with a bare majority by the Vice-President's casting vote, might be tempted to strengthen its forces in order to push through doubtful measures, it would be intolerable that it might suspend one, two, or, for that matter, any number of members, indefinitely "for disorderly behavior." There was nothing left for the Senate to do except what it did on Friday—censure both of the offenders, as the wiser members of the Committee on Privileges and Elections recommended.

For the first time since the construction of our modern naval vessels was undertaken, a table has been published showing the original cost of each vessel and the amount of the repairs upon it. The compilation, which is the work of Paymaster-General Kenny, is interesting, primarily, as showing the exact cost of the finished vessel—not the sum paid to the builder, but the total expenditure necessary to put the ship into commission as an armed and equipped vessel of war. From this it appears that the battle-ship *Oregon* cost the enormous sum of $6,575,032.76, which is half a million more than the price of the *Massachusetts* and *Indiana*, vessels of a similar type and size. But the *Oregon* has cost thus far only $70,000 in repairs, exclusive of those now going on, while the *Indiana* has had $282,000 spent upon her since completion, and the *Massachusetts* $223,000. The cruiser *Philadelphia* cost less than two millions, but the enormous sum of $514,000, or more than 25 per cent. of her original value, has been lavished upon her to make her serviceable, and this in about twelve years. Repairs to the *Olympia*

now amount to about $500,000, and the *Cincinnati*, a cruiser built by the Government for $2,371,904.52, has charged against it repairs costing $457,000. The little torpedo-boat *Ericsson*, built for $144,142.08, has actually needed $48,749.99, or one-third her cost, to keep her in service. Altogether, $9,346,235.16 has been expended on repairs since 1888, according to Paymaster-General Kenny's tables. When a prominent Senator was recently taken through the wonderful new Library of Congress, he could hardly express his astonishment on learning that it had cost only the price of one battle-ship. Beside the great civilizing and uplifting work the library is doing, the wasting of millions on ships of war is like throwing money into the sea. What humanitarian work could not have been accomplished with the one hundred and ten millions the navy has cost in construction and repairs alone since 1885!

The dignified protest of a group of well-known painters against the tariff on works of art should carry weight with Congress, as it certainly will with the more intelligent portion of the public. These gentlemen recall that this "tariff on civilization" was actually removed without any of the dire consequences which are supposed to attend upon tinkering with the tariff. The tax was once cut in two, and once, in the Wilson Law, actually done away with. It remained for the framers of the Dingley Law to reimpose the tax, and to apply it not only to modern works of art, but also to antiquities, which were formerly exempt. The artists who protest against this ignorant policy show a patience in the matter which we find it difficult to observe. If the tax on works of art is unnecessary for the purpose of raising revenue—and everybody knows that it is unnecessary; if the duty serves no protective purpose—and everybody knows that artists believe it does not; then there was never any reason for passing such a law, or for retaining it upon the statute-book if by any unhappy accident it had been passed. It will be difficult to make a protection-ridden Congress see so obvious a fact, and the painters who plead for a more hospitable attitude towards art see clearly that they have a long campaign of education before them. We believe that the time is opportune for such a movement, and that by skilful organization and agitation it may be possible to secure at least free entry for antiquities.

Collector Ivey of Sitka has been removed from office, but with him goes an Americanism of the elder, robust type. His clarion defiance of Great Britain, with his open refusal to obey the orders of a subservient and cowardly law-abiding Secretary of the Treasury, would have stirred all hearts a few years ago. To-day it passes unnoticed, or else is laughed at. The heroic Ivey had issued an eminently patriotic order closing the port of Unalaska to Canadian sealing vessels. From timid Washington came a telegram directing him to revoke his order. But little did the authorities know Ivey. He promptly replied, "My Americanism will not allow me to rescind the order." As for the British treaty rights which his superior officer had referred to, Ivey punctured that pretence finely by showing that the treaty was, in any case, "ancient," and by maintaining that "the sooner it is abrogated the better"—the readiest road to abrogation being, of course, a refusal to be bound by it. Nor did he let the frightened Secretary off on the score of possible trouble resulting. "You," he wrote scornfully, "may fear the shadow of international complications and rescind this order, but a Reed, an Olney, or a Blaine would not." That has the true ring, and once would have roused the country. In happier days Ivey's splendid defiance of treaties, in the name of Americanism, would have brought him a nomination for some good office within a week. Now he is put out of office, and none so poor to do him reverence. His official head is off, but his Americanism goes marching on.

The testimony given last week by Gen. Hughes, before the Committee on the Philippines, in reference to our hospital for lewd women in Manila, was to the effect that he was solely responsible for it, and that he did not regret his act, for "if the evil had not been checked, fully two regiments would have been disabled." He did not say how many men had been disabled, in spite of these admirable precautions. We do not join with those who consider Gen. Hughes's action censurable. On the contrary, we think that, considered merely as an act of humanity to the miserable women, it was praiseworthy. No doubt some of our soldiers were kept out of the hospital because the women were kept in it. But the affair has a wider aspect. It recalls the somewhat famous Atkinson pamphlet, which the wise men in Washington excluded from the mails to Manila, some two years ago. Among other things deemed important by Mr. Atkinson were sundry tables of statistics drawn from the medical records of the British army in tropical countries, showing the proportion of soldiers under treatment for the very same disease which Gen. Hughes was trying to ward off in Manila, and showing also how impossible it is, by the best sanitary arrangements, to do more than curtail in some small degree its ravages. Treatment, after the disease is contracted, is of great importance and has been increasingly successful, but attempts at prevention have been of only doubtful utility. If Mr. Atkinson's warning had been heeded, there would have been no American soldiers in the Philippines to contract and to convey these loathsome diseases. But what a flood of light Gen. Hughes has thrown upon the desirability of army service in the tropics as a career for young men!

After taking a second, but not a sober, thought on the proposition for a modified system of popular representation in the Connecticut House, the small-town delegates in the Constitutional Convention have rejected it, and the utter failure of this attempt at representative reform is probable. The little towns have nothing to lose by the failure, and, through their command of the Legislature, they can defeat any new attempt at reform through Constitutional methods. That they realize, however, the gathering political storm, is evidenced by their suggestion to make the Senate a larger and a popular body. This inversion of the natural order of legislative construction is offered as a sop to the aggrieved cities, but they are not likely to accept it. The demand for popularity in representation which forced the calling of the Convention, looked solely to a reconstruction of the House. Popularity in the make-up of the Senate was recognized in an amendment to the Constitution adopted last November, and there is no concession, therefore, in the present offer. But even were the cities disposed to exchange half their present membership in the House for a larger Senate, they would justly demand a Senate whose size would balance that of the House, and thus give effect to the popular will in the choice of United States Senators, or in the determination of important legislative questions. To that end a Senate of the size suggested by the rural delegates would be much too small.

Criticism of the Davis bill, which provides for an eligible list of city architects, takes the ground that the list is unduly small, or else that the Fine Arts Federation, whose nomination must in every case precede the Mayor's appointment to the list, is not the proper body to exercise that function. As for the length of the list, the Fine Arts Federation is to present before the 1st of June a list of not less than one hundred names of architects who in their judgment are competent to do work for the city. From this list the Mayor must appoint *at least* fifty architects, and may appoint up to a hundred. If, however, he appoints less than one hundred, he may increase the list by only five a year until the hundred is complete. Beyond one hundred he may appoint freely upon the nomination of the Fine Arts Federation. To recapitulate—the Mayor may fill the list gradually to a hundred or appoint a hun-

dred architects immediately, and enlarge the list as fast as the Fine Arts Federation sends him names. The Federation consists of eleven art societies, three of which are architectural. Its standing committee on city architects would presumably act more impartially than a committee from any one of the architectural societies. No committee chosen from the profession generally would command higher respect. Finally, the Federation, by the new charter, already nominates members for the Municipal Art Commission, and might very appropriately assume the cognate duty of selecting architects for the city. Any discrimination of this sort is bound to be the occasion of endless heartburnings. But somebody must assume this delicate task, or the way remains open for the Horgans and Slatterys.

Few men in the American financial world will be missed more genuinely, as time goes on, than Frederick D. Tappen, who died last week at Lakewood. It can be said of Mr. Tappen, as of very few other men in the walks of trade, that a grave financial crisis is the hour when the loss will be most strongly felt. Other men have done much more than he to direct the course of American finance in times of prosperous industrial progress and in times of gradual reconstruction after collapse. It is the peculiar fact of Mr. Tappen's history that he was called invariably to the wheel, by the unanimous voice of his colleagues, when the storm was at its worst and the ship showed signs of foundering. In the panic of 1893 Mr. Tappen was not even a member of the Clearing-house Committee, in whose hands control of the New York banking situation rested. Yet, without a dissenting word, he was placed at the head of a new emergency committee which virtually superseded all others. The banking community made no mistake; its assurance came, in fact, from abundant experience. With Wall Street as a whole completely bewildered, confounded, and, disheartened, the protective and remedial powers of practically the entire American banking system, committed really to the hands of this one man, were applied with a promptness, decision, and courage whose results were instantaneous. This occurred not once, but on at least five separate occasions. More remarkable still than this invariable success in mastering the crisis was the quiet and unassuming modesty with which Mr. Tappen, the emergency work once done, stepped back to his every-day duties in Wall Street. The personal notoriety and éclat which have often been made to follow such achievement were as distasteful to him as secret and underground banking practices would have been. The career of such a man means more to his generation, in our judgment, than the most dazzling achievement of mere financial wealth or power. It stands as an example of what is best in American citizenship—complete and unhesitating devotion to the public welfare, without asking other return than the consciousness of duty well done.

President Wheeler of the University of California deals football the wounds of a friend when he says that the game is becoming more and more restricted to the specialist, that it tends to exclude even the average healthy man, and that it, on the whole, encourages "rooting" rather than physical development. It is worth the while of college faculties and graduate committees on athletics to consider these things, with a view to possible reform of the playing rules. When a game becomes so complicated that the mastery of its elements requires long study and training, its general utility immediately decreases. No college, for example, would spend tens of thousands of dollars a year and send excited throngs to encourage its fencing team. And quite aside from the danger of the game, the growing complexity of signals and "formations" makes the game, year by year, more difficult even to follow intelligently, still more to play. We may yet come to the pass where up-to-date colleges will offer compulsory courses in the strategics of football, just as already the students in certain colleges rehearse the college yell before a great game. Every man can pull an oar in some fashion, and every man handle a bat and ball, but an uninitiated man in a football game is out of the question. Here the English Rugby game, with its open play, is far more available than the *Kriegsspiel* which we Americans have evolved therefrom.

Application by Europe of a "commercial Monroe Doctrine" against invasion by American merchandise is the latest suggestion, anent the American peril. We suppose the Hungarian Premier, in making this suggestion on Thursday to his Parliament, was inspired by indignation at America's growing exports to countries which have heretofore been Europe's particular commercial preserves. Introduction of an "American system" of low-price necessaries of life would presumably be pronounced intolerable, under the plan suggested. Europe, if the analogy were pursued, should warn the United States of its purpose to resist, by every means in its power, as a wilful aggression upon its rights and interests, all further expansion of American trade in such directions. But what would happen next? The Hungarian Premier appeared to have some misgiving on that point. Each of the European nations, too, he admitted, is fighting against the commercial interests of the others. What would be the use of a "commercial Monroe Doctrine," applied by Austria, for instance, against the United States, if Germany were straightway to rush into places left vacant by the retreating American manufacturer, and Austria were to be shut out precisely as before? We fear M. de Szell has been led astray by an alluring metaphor.

The truth is, the body of Europe's plaint lies undoubtedly against cheap merchandise in itself, and the interest of the situation is increased by the fact that these indignant statesmen are using against us the very protests employed by ourselves against them, only a decade ago. At present it is not our ox which is being gored; but if the average protectionist oracle had a sense of humor, he could not fail to enjoy the joke, even at his own expense. In the calendar year 1901 our merchants forced unhappy Europe to buy a million dollars more in wearing apparel than it took from us in 1899. Who cannot see beneath these cheap coats the cheap man that a protectionist Administration dreaded in 1888? We do not know that the ethical side of the campaign against American merchandise has yet been fully grasped by the foreign politician. The "British gold" argument, which did glorious service here in its time, has been used, with proper change of garments, by the foreigners, and American gold has been denounced and defied as it no doubt deserved. But the attack on cheapness itself was the more brilliant move of our own protectionists. Europe will find abundant material for the purpose in such standard works as the Home Market Club's occasional publications and the Republican campaign text-books of 1888 and 1892. It need only change the name of the hated adversary, corruptor, and oppressor from England to America.

If Lord Rosebery thought that his repudiation of Irish Home Rule would bring over to his standard the Liberal Unionists, he has already had a rude awakening. They are perfectly willing that he should come to them; they have not the slightest idea of going to him. This was made clear by the Duke of Devonshire's speech on Thursday. The case was forcibly put by the Duke of Leeds, immediately after Lord Rosebery's Liverpool speech in which he "wiped Home Rule off the slate." What did this show? Why, simply that Rosebery had taken sixteen years to discover what the Liberal Unionists perceived at once! "We know," said the Duke of Leeds, "that there is more joy over one sinner that repenteth, etc., but surely the ninety-and-nine did not immediately appoint their erring brother to be the one man to guide their destinies."

FINDING OUT HOW IT IS OURSELVES.

Mr. James Bryce, in the course of a letter to the *Nation* in 1881, made a striking prediction which is now in process of fulfilment as striking. He was writing of Gladstone's policy of moderation towards the Boers, after Majuba, and of the fact that it could be carried out only as a moral obligation; and he said that a "painful lesson" of those South African complications was "the extreme difficulty which any state, and especially a free state, where power changes hands from one party to another, finds in governing distant dependencies." With the prescient forecast of the true philosophic temper, he added: "This lesson may become significant to you *should the policy of annexation be ever resumed by the United States.*" And then he remarked, in the guise of moralist and historian combined: "We are beginning to judge the behavior of the Russians in Turkestan and of the French in Algeria—even, perhaps, the darker misdeeds of the Spanish conquerors of America—more leniently when we perceive from our own experience how hard it is to govern justly colonies of mixed population, even with the help of steam and the telegraph."

The past four years have made this a very sure word of prophecy for the United States. Our old easy condemnation of the blunders of other nations has expired on our lips as we have successively fallen into the same pitfalls. The vices of Spanish colonial policy which we used to hate on sight, we have, when seen too oft, grown unpleasantly familiar with, and have first endured, then pitied, then embraced. To exploit a dependency in the selfish interest of the home country; to ignore the urgent recommendations of our own governors of distant islands, and to shut our ears to the bitter cry of the natives whom we tax without representation—that policy, from being the object of our Fourth of July denunciations, has too nearly become an axiom of government with us. No more curious reversal of a nation's historic judgments was ever seen. To lift horrified cries against Gen. Weyler, only to have our own army officers admit a little later that "he knew his business"; and then to pay Spanish colonial methods the sincere compliment of imitation—truly we are bound, as Mr. Bryce said, to judge "more leniently" the nations which we rashly condemned before we found out how it is ourselves.

It is not necessary to do more than suggest the details. The present argument of the protectionists in Congress, who would squeeze the juice out of Cuba and the Philippines like an orange, and then fling the pulp away, declares its own origin. "Made in Spain," is stamped all over it. It is simply the old idea of the *Conquistadores*, to bleed the colony for the sake of the *metrópoli*. No grandee of Spain ever demanded in Madrid a right to a monopoly of colonial trade with greater insolence or a more hateful disregard of the interests of the colonists than the beet-sugar magnates have shown at Washington in their cool assertion that the sole duty of Congress is to legislate for the advantage of "our own people," and let the Cubans and Filipinos stew in their own fat.

Another graceful tribute to the more excellent way of Spain are we paying in our cynical disregard of the advice of our own colonial Governors. The Spanish Government was not without warnings from its local administrators. From Las Casas to Polavieja, it had men in its dependencies of intelligence enough and humanity enough to urge a policy of commercial justice and of consideration for the native. But selfish interests in the Peninsula usually were able to override all such recommendations. And our selfish interests are working for the same end. Congress passes a tariff bill for the Philippines in calm disregard of Gov. Taft's urgent advice. It stands facing both ways, as respects Cuba, though Gen. Wood is telegraphing that our indifference and delay are working havoc with the interests of the people under his rule. The Cortes of Spain ought to send Speaker Henderson and Chairman Payne a special vote of thanks for their delicate flattery in following its old and vicious example.

The disgraceful hesitation of Congress in coming to the relief of Cuba is all the more unaccountable in view of the fact that our Representatives have in Porto Rico a living object-lesson of what wise and healing legislation can accomplish. Healthy conditions of trade and industry are, after all, the main end of government. Oppressive taxation and strangled commerce are at the bottom of most revolutions; and the surest road to peace and contentment is to give trade a chance to expand freely. This has been done in Porto Rico, and the result is to remove that island from our list of vexed questions. Enabling the inhabitants to stand on their own feet has taken them off our corns. Impartial testimony to the present prosperity of Porto Rico is found in a recent issue of the Paris trade organ, the *Journal des Fabricants de Sucre.* It states that the situation of the island is greatly improved; that the sugar crop will reach 100,000 tons; that more money is in circulation; that new railroads and sugar factories are in course of construction, and that the development of Porto Rico is rapidly going on. And all is due to what? To "the establishment of free trade with the United States."

There stands the pertinent example for our timid and vacillating legislators at Washington. Like disease, like remedy. Do they not remember how the fight for justice towards Porto Rico was won? In that case, too, selfishness and cowardice swayed Congress at first. It took the pressure of an indignant public opinion to force it to the final act, whose happy consequences we now see. Why go through the same wearisome process with Cuba? Why be more stupid than the Spanish proverb says no man can be, and break our leg twice over the same stone? In the end, justice will be done. Eventually, as all admit, Cuban products must be given an entry into our market. The danger is that, while the House shivers on the brink, and fears to launch away, we shall poison Cuban public opinion, provoke those labor troubles in the island which Gen. Wood says he is afraid will soon break out, and make our abandonment of Spanish folly, which is bound to come at last, so slow and grudging as to rob it of all its grace and half of its conciliating effect.

ABOLITION OF SUGAR BOUNTIES.

It appears certain that the international sugar conference has agreed to abolish all bounties, direct and indirect, and to reduce the customs surtax to a rate at which the so-called *Cartel*, or Sugar Trust, of Germany cannot exist. The execution of this agreement will be placed under international control, but it will not go into effect till September, 1903. It is reasonably clear that this decision was hastened by intimations from the British Government that, unless the bounties on exportation were abolished, a countervailing duty would be imposed upon the bounty-fed product. Such a duty levied in Great Britain would take the entire profit out of the exports from the Continent.

Hitherto Great Britain has refused to take this step. Her consumers have enjoyed a free breakfast-table at the expense of the Continental taxpayers, and British manufacturers of preserves, jams, marmalade, and confectionery have been able to distance competition by the help of the same generous donors. It is not the custom of the British public to fear Germans when bearing gifts, but the wail of the West Indian colonies has at last touched the heart of the mother country. The sugar-growers of the Lesser Antilles and of British Guiana have suffered from the competition of the bounty-fed product of Europe till they are at the last gasp. They must either adopt some other means of earning a living, or the competition in sugar-growing must be put upon the normal basis. If, as is supposed, Great Britain intimated her purpose to adopt countervailing duties, she did so in pity for her West Indian colonists.

The German Government, too, will be glad to be rid of the bounties, which

have been a sore burden to the budget, but which could not be thrown off while other countries continued to pay them. If the sugar bounty were a new contrivance in the world, nobody would expect such a thing, any more than a bounty for shoemaking, or tailoring, or plumbing. But it started without design, and grew by slow degrees, until it became too strong for even the Government to control. It began half a century or more ago. The Government imposed a revenue tax on beets of so much per ton, and then quite properly allowed a drawback on that portion of the sugar which was exported to foreign countries. The drawback was computed on a certain rate of yield from a ton of beets, so that, if a manufacturer should buy one thousand tons of beets and export his entire product of sugar, the amount of his tax and of his drawback would be equal. But if, in the course of time, he should learn how to get double the quantity of sugar out of each ton of beets, then his drawback would be double the amount of the tax, and one-half of it would be a bounty on exportation.

It was in exactly this way that the bounty lifted its hydra head in the sugar trade of the world. If there had never been an internal tax on beet roots, or if the Government had advanced the tax in proportion as the yield of sugar increased, there never would have been any bounty on exportation. But the Government did not do so. The sugar-makers either had a "pull" which prevented an increase of the tax *pari passu* with the increasing yield of the beet, or, as is more likely, they persuaded the Government that it would be a great and glorious thing to make Germany the centre of the sugar trade of the world, as they have, in fact, done. The situation in which the sugar trade of Germany now finds itself is that of a hot-house industry, which is about to have its artificial shelter taken away, and to be exposed to the competition which was necessary to its health, and which it ought always to have met.

Statistics of the German sugar trade for 1901 show that the 395 sugar factories of the Empire produced 1,979,118 tons of raw sugar, and the 47 refineries turned out 1,033,446 tons of refined. All this, of course, was made from beets, now grown on about 1,100,000 acres of farm land. The total output was some 200,000 tons greater than in 1900, and the burden of the bounties correspondingly heavier. Yet domestic consumption actually fell off, showing how true it is that, as Professor Sumner has said, the bounty system works so that Germany has the manufacture, but other countries have the sugar. It appears to be the case that the more sugar Germany produces, the less she has to eat. While the total product increased 200,000 tons in 1901, the home consumption diminished by 78,000 tons.

What effect the abolition of bounties will have upon the world's price of sugar it is too soon to say. We observe that Mr. Oxnard jumps at once to the conclusion that the price will be restored to its 1899 level, and that, therefore, it is not necessary to reduce the tariff on Cuban sugar. He is said to have rushed to the White House on Saturday to lay this important truth before the President. But to this there are three things to say: (1) The abolition of bounties will not take place, if at all, till next year, and it is this year that starving Cuba is appealing for relief; (2) in any case, the German surplus overhanging the market is too great to admit of any speedy rise in price; and (3) if the price does go back to that of 1899, it will be just at the figure which led Mr. Oxnard to assert that American beet-sugar manufacturers could make money even if there were free trade with Cuba. We should therefore advise him to say nothing whatever about the abolition of sugar bounties. It will not give to the Cubans that relief for which they look to us alone, and which it is our solemn duty to grant.

THINKING IN HUNDRED MILLIONS.

The jests of a nation are often more significant of its intellectual and moral standards than formal treatises; and in the current witticisms about present-day notions of wealth in America we get a very real and vivid glimpse of what is essentially a new habit of thought. "It's hard on Algy! His father cut him off with only five millions." Poor Richard's Almanac brought down to date would read, "Take care of the millions, and the billions will take care of themselves." We have, in fact, insensibly adopted a new mental arithmetic in all matters of large finance, private or public. We think in nine figures. A hundred millions has become a sort of unit of measurement. Anything below that is a negligible quantity. When you get above it, we say, "Now you're talking!" We take the highest estimates of our fathers—their greatest fortunes, their largest capitals in banking or commerce, their most extravagant governmental expenditures—and sit down quickly to multiply them by 100. Instead of the almighty dollar we have made it the almighty $100,000,000.

Already we have grown so accustomed to the easy tossing about of huge capitalizations that the eye is not caught by a new incorporation unless it glares with a whole row of naughts and dollar-marks. Mere millions no longer attract notice—we hope you don't think we are in the retail business! The Steel Corporation, with its daring leap above $1,000,000,000 capitalization, not only frightened Europe, but permanently affected the American imagination. We have been transported into a large and lavish Asiatic atmosphere. The wealth of Ormus and of Ind is no longer too bright and good for our financial nature's daily food. We revel in the possibilities of wealth beyond the dreams of avarice, and have come to make Col. Sellers, with his beggarly millions, look like a mere curbstone operator. This new temper makes us credulous, it cannot be denied, and perhaps just a bit gullible. Promoters know that they will never seem so plausible as when they soar above the hundred-million mark. To talk confidently about floating $150,000,000 in new securities seems of itself almost to make the bonds gilt-edged. Such great capital must argue vast profits in sight! That dispatch the other day from North Dakota, quietly recording the chartering of a company with unknown directors and for unnamed purposes, with capital stock to the tune of $900,000,000, one hardly knew whether to take in jest or earnest. We have been so dazzled by big figures that we are astonished at the moderation of incorporators who let a little thing like $100,000,000 keep them from breaking the record.

One curious thing about this craze for immense capitalization is that it is defended and urged in the name of "economy." Thus, Mr. Schwab, on his return from Monte Carlo, grew almost dithyrambic in his praise of great combinations, precisely for the reason that they were so "economical." To a saving and thrifty New Englander of the old school, this would sound very like a contradiction in terms. It would seem like taking the most costly house in town in order to cut down your bills for fuel and servants. "In order to practise the strictest economy," Mr. Schwab appears to say, "let us neglect everything below $100,000,000." We are aware, of course, that he does not mean this, and have no doubt that there is a substantial argument for business consolidations in the economies, both of production and distribution, which they may effect. And we are also perfectly aware of the fact that it is only too possible for such a great combination as Mr. Schwab has in mind to exhaust its economies many times over in extravagant salaries, swollen fees, and especially in watered and wasted capital. But that is not to the present purpose. What we wish to ask is, how these two conceptions of enormous wealth and minute economy are going to be harmonized in the general mind. How does the thing work in private business? How does it affect the conduct of public affairs?

Every one knows what the instinctive feeling would be. Think of a rich man guilty of cheeseparing! Imagine a nation with overflowing coffers saying anything but "Hang the expense!" We know that, as a matter of fact, the consciousness of a plethora does not in-

duce parsimony. Walter Bagehot long ago laid down the general principle which governs public assemblies in these matters. "If you want to raise a certain cheer in the House of Commons, make a general panegyric on economy; if you want to invite a sure defeat, propose a particular saving." And what we say is, that the habit of thinking in hundred millions necessarily strengthens this native tendency to squander the public money. The careful scrutiny of details, the cruel analysis of a fair round estimate of, say, $10,000,000, into its constituent items, each of which can be cut so as to make the total required only $7,500,000—this sort of economical statesmanship inevitably passes into discredit and out of vogue when the scale of national revenue and of national outlay becomes so vast that to argue for petty saving, here and there, sounds like a Rothschild proposing to scrape up candle-ends for remelting. With such gorgeous Oriental notions of a fairyland of inexhaustible riches, we necessarily lose something of the old stern watch over expenditure and the unrelenting hostility to waste, while we are less and less disposed to provide betimes for the day when

> "——prosperity begins to mellow
> And drop into the rotten mouth of death."

Such being the extravagant tendency of our public finance, we ought to give all the more credit to the few resolute economists, like Gov. Odell and Gov. Crane and Congressman Cannon, who have not fallen victims to the glamour of the hundred-million fallacy. They have as keen an eye as Ricardo was said to have for the "commerce of the imperceptibles." A minute saving per man per day swells into a comforting total by the end of the year, and is as well worthy of being capitalized boastfully as any bubble company of them all. This, and the great truth that profit depends eventually upon the narrowest fraction of advantage over a competitor, are the essentials of that business management which alone, in the long run, is successful, and which, we fear, our recently acquired habit of thinking and talking in hundred millions tends to obscure and degrade in the public mind.

A CITY IN FLUX.

There is something of a parable in the present condition of New York, gashed by the subway trenches, pitted with excavations for new buildings, and littered with the débris of the old. That the parts of the city where business and pleasure are at their fiercest are torn down and rebuilt every few years is a commonplace of comment; but the fact that socially as well the city has refused to settle down has not been so frequently remarked. The sign of an established and durable social order in a city is the presence of clearly defined neighborhoods, where people of common tastes and similar resources find near at hand their natural associates and all those things which chiefly minister to the pleasures of life.

Now it is doubtful if any great number of New Yorkers, except those whom poverty or foreign origin has herded together, are in any such fortunate situation. You will find an Italian, a Chinese, a Hungarian quarter, but where will you find an aristocratic, an artistic, or a university quarter? In this, New York is unlike other great cities. In Paris, learning clings to the neighborhood of the schools, blood to the Faubourg St.-Germain, money to the vicinity of the Arc de l'Étoile, Bohemianism to the Butte of Montmartre, while art is grouped about one or the other of these centres. With us none of these things are as yet settled. The considerable inconveniences of a society in a state of flux need not be dwelt upon. Material disadvantages first present themselves—the time spent in coming and going; one's family physician almost as far away as Sheridan at Winchester; one's clergyman so remote that the pastoral relation is necessarily intermittent, or completely broken; one's favorite recreations miles from his residence, and his office leagues from either—this is the common lot of the well-to-do New Yorker.

All these things are and should be faced with fortitude. Even a home-keeping soul can learn to move, and to see friends move, with equanimity; and a stoical philosopher can persuade himself that the daily elbowings of the throng and daily torsion on a car strap are among "those things which do not concern a man," and hence are indifferent. It is not so easy to accept a condition which, while it renders even the casual contacts of society difficult, restricts even more the possibilities of intimacy. For, after all, a chief pleasure of life is to be so situated that you can get at the people whom you like. It is upon this desire that social neighborhoods are built. The quite forgotten poet, Shenstone, expresses this ideal of a community very entertainingly in one of his letters:

> "Had I a fortune of about eight or ten thousand pounds a year, I would, methinks, make myself a neighborhood. I would first build a village with a church, and people it with inhabitants of some branch of trade that was suitable to the country round. I would then, at proper distances, erect a number of genteel boxes of about a thousand pounds apiece, and amuse myself with giving them all the advantages they could receive from taste. These would I people with a select number of well-chosen friends, assigning to each annually the sum of two hundred pounds for life. The salary would be irrevocable, in order to give them independency. The house, of a more precarious tenure, that, in cases of ingratitude, I might introduce another inhabitant."

This prevision of the numerous suburban "parks" and clubs of to-day was never actually realized. It might conceivably have proved less delightful than Shenstone anticipated; such exclusive settlements often disappoint the ideals of their promoters. But this fancy of Shenstone's represents very faithfully an ideal of social life which is as valid for metropolitan as for rural conditions—an ideal of neighborliness which fares but badly in a city that has as yet found itself only on the side of its business activities. There is an evident incongruity in the fact that a city which supplies more generously than any other of the New World the expensive and difficult means of culture, should fall behind in those simpler conditions of culture—ease of social intercourse, and ready interchange of its best opinions and tastes.

The sense of this lack is expressed in perennial rumors that this, that, or the other woman of ability is about to start a salon. But a salon is never started, it grows; and it grows not wholly by reason of community of ideas, but also because its members are in some kind of frequent association which is an expression of the neighborhood idea; and until we have clearly defined neighborhoods, we do well to withhold our trust from coteries prematurely compelled into being. Heroic measures of a more individual sort have been proposed. "Cultivate your immediate vicinage," some say; "cut off rigorously all social relations which by reason of distance cannot judiciously be maintained." But this course requires more of the Spartan than there is in many of us, and it is fair to say that before a doctrinaire New Yorker of this stamp had gained his circle of friends within his one-mile or two-mile radius, most of those whom he most cherished would be scores of blocks away, with parks, if not rivers, between, and he himself stranded in that splendid isolation which Mr. Chamberlain and others profess to admire, but which no one really finds tolerable.

Readjustment and the formation of neighborhoods are in fact hardly practicable until business shall have worked its will upon this sorely entreated town. *Place aux affaires* is, confessedly or not, the motto of all of us, even of the most gallant. When business has staked out its claims—and this process is nearly finished—in the remaining portions of the city, people of like tastes and pursuits will gradually find each other, and seek the advantages of propinquity. What the final distribution will be it is impossible to predict—though Columbia University is clearly the centre for the academic quarter of the future—and matter of idle curiosity only; for few of us will be here to see the city shaped by a more humane idea than that of business. Meanwhile there is entertainment, if not much comfort, in the spectacle of a city in flux. In all the centuries so good an example has rarely occurred. No civilized society has, we believe, had so drastic a mixing; so that the well-to-

do classes of New York to-day are a singularly fascinating subject of speculation for the social philosopher. Finally, we are measurably sure at least of that immortality which appertains to transition types, and the cultivated New Zealander who excavates our sites and deciphers our records will, centuries hence, class us reverently with pithecoid man and the four-toed horse.

THE IRREPRESSIBLE CONFLICT IN THE EAST.

OBERLIN, February 24, 1902.

Sufficient attention does not seem to be given to the natural forces at work producing unrest in the Far East, and leading in the near future to an inevitable conflict which will mark one of the great epochs in human history. The forces bringing Russia, China, and Japan into conflict are neither superficial nor temporary, but deep-seated and permanent. They have at their foundation the Malthusian law that population naturally tends to increase faster than the means of sustenance. Of Japan's 146,000 square miles of territory scarcely more than one-tenth is capable of cultivation, the rest being so mountainous that even Japanese skill and industry have been unable to make it productive. The population, therefore, swarms about the margin of the island in numbers that seem almost incredible. Already on the average, if we except the comparatively inhospitable northern island, there are more than 2,000 people for every square mile of arable land in the kingdom. Nor is the population stationary, but the census shows that it is increasing at the rate of more than 500,000 annually. Ten years ago it was 38,000,000; at the present time, excluding the 3,000,000 annexed in Formosa, it is upwards of 43,000,000.

This rapid increase of population is partly the result of the progress of the kingdom in the application of sanitary arrangements and medical skill tending to reduce the death-rate, while the social customs controlling the birth-rate remain unchanged. The effect of science in diminishing contagious diseases and in reducing the death-rate among children is everywhere marked. At the same time the practical abolition of infanticide contributes to the same end. In all the ameliorating conditions every one must rejoice; but when these are coupled with the old-time lack of self-control leading to universal early marriages, a problem is rolling up before which Japanese statesmen are appalled. At the present rate of increase there will, before the middle of this century, be a hundred million people to provide for. It is this prospect which is leading Japanese statesmen to make such frantic efforts to secure opportunity for colonization. Being practically shut off from going to other foreign countries, and Formosa being already largely occupied, Japan would naturally look to Corea and Mantchuria; but of these places Corea would afford only partial relief, both because of its limited area and of its present population. The northern province of Mantchuria, however, is still almost as much in a state of nature as were the prairies of the Mississippi valley when the Indians roamed freely over them.

But, by the operation of equally irresistible natural forces, Russia and China are in the way of Japan's continental expansion. In Mantchuria, the very country which Japan needs, we have the spectacle so noted in mechanics, of an irresistible meeting an immovable object, for Russia's march towards the Pacific Ocean is the slow movement of the same deep-seated forces which are disturbing Japan. The Slavic race is increasing at the rate of nearly 2,000,000 a year. In 1859 the population of the Russian empire was only 74,000,000; in 1900 it was 135,000,000. The opening up of Siberia by the introduction of steam navigation, and later by the construction of the great Siberian Railroad, has drawn population eastward in the Russian empire very much as the same forces have operated to draw it westward in the United States; so that now there are between 6,000,000 and 7,000,000 Russians, mostly peasants, in Siberia. Mantchuria is already surrounded upon three sides by these Russian colonists, who are looking upon the fertile fields across the Argun, the Amur, and Usuri, much as our settlers in the West a few years ago looked upon the unoccupied territory of the Dakotas and Oklahoma.

The conditions in Mantchuria are peculiar. The Mantchus proper were not given to agriculture, like the Chinese, but were, and are, largely nomadic. The conquering of China, so far from changing their nature, rather intensified their characteristics, and they have since been subject to the deterioration which naturally takes place in a conquering race. The most enterprising members have been drawn into China to serve as military guards throughout the empire, and their descendants are everywhere partially supported by pensions just sufficient to demoralize them. The "Tartar" portions of the Chinese cities consist of these unenterprising and semi-dependent people, who are anything but an addition to the productive forces of the empire. Meanwhile, the Chinese, with their frugal and industrious habits, have been spreading into Mantchuria until the southern half of the territory is already densely populated by agriculturists of Chinese origin.

The main reason why the Chinese have not thus taken quiet possession of the whole of Mantchuria is the unsettled political conditions. From time immemorial, robber bands have had free range throughout Mantchuria, the Chinese Government being too weak to suppress them, so that practically the only security to commerce in Southern Mantchuria has been obtained by the authority of a "robber trust." The robber bands became so numerous that they were driving all commerce from the lines of traffic, and so were killing the goose that laid the golden egg. To such an extent were the robbers overdoing the matter that, in self-defence, the larger bands were organized to protect traffic from the depredations of the smaller bands, and then formed themselves into something analogous to an insurance company. It is a common thing in Mantchuria to see the little flag of what was formerly a mere band of robbers, flying over a loaded team as a badge of the protection which this now respectable organization has graciously extended to the merchants for a stated sum of money. Over the central and northern parts of Mantchuria, however, the beneficent influence of these organizations has not yet extended, so that there has been little inducement to fill it up with a settled farming population. As a result, this population has scarcely passed beyond the watershed of the Lao River, leaving the vast basin of the Sungari (which is comparable with that of the Ohio) pretty largely in the state of nature, and this is the region most coveted by the three nations whose interests now clash along its border.

In the natural progress of events, Russia has a decided advantage over the other contestants. The free navigation of the Amur and Usuri Rivers was something of a step in advance for Russian interests, but the building of the Chinese Eastern Railroad, which, from one end to the other, goes through the very centre of the region, direct from Kaidalova to Vladivostok, and which bisects the southern half from Harbin to Newchwang and Port Arthur, gives Russia a vantage-ground from which she cannot be dislodged by any attacks upon the maritime border. The relation of Russia to this region is not very different from that which fifty years ago it sustained to the region north of the Amur, and, indeed, which the United States sustained at one time to the unoccupied lands upon the border of Mexico. In 1855 Muravieff might well have claimed the Amur valley by right of discovery, so little was the country occupied by a settled population and so little was known about it. If now Russia should retain possession of northern Mantchuria, it would not be to drive a settled population out, but to open it for the first time to the industries of a regularly organized government. But even then it would still be a question whether the country would fill up with Slavs or with Chinamen, for, in a fair competition, or, indeed, with any sort of a chance, the frugal, industrious, hardy Chinese laborer is more than a match for the easy-going, improvident Russian peasant, while the Chinese possess an advantage in their vast numbers and in their proximity which cannot easily be overcome.

Four hundred millions of people already adjusted to a civilization which has endured for centuries, and with social customs which secure an abnormally high birth-rate, present an immovable obstruction to Russian colonization. The Chinese will conquer by their very numbers. It is impossible to dislodge them from the field they already cover, while they are spreading out like a rising tide over all the surrounding region. All along the Mongolian border, beyond the outer Great Wall, Chinese farmers are covering the country with their cultivated fields, substituting in this region oatmeal for rice as the staple staff of life, while around the Russian settlements in the vicinity of the Amur it is they who are depended upon to supply the cities and mining camps with agricultural products.

In China, also, as in Japan, contact with Western civilization and the establishment of Western standards of morality are likely to stimulate the growth of population. In China, as in Japan, marriage at the very earliest possible age is the inevitable result of the whole social organization. The population is kept within the means of subsistence by a high death-rate among the children due to unsanitary conditions, to the universal prevalence of smallpox, and to infanticide, while famine and pestilence every once in a few years sweep off the people by millions. An impressive index of the extent of infanticide I encountered two

years ago at Shiwantse, the centre of the Catholic missions in Mongolia, the former residence of the celebrated Abbé Huc. Here, in this out-of-the-way place in the country, far away from any city, were 400 Chinese girls in the Catholic mission school, and they were as interesting and attractive a body as could be found anywhere in any country; but we were told by the self-denying Belgian missionaries who had consecrated their lives to the work, that all these girls had as infants been exposed by their parents to death, from which they had been rescued and brought to the interesting state of development in which we saw them.

It requires but little reflection upon the facts here presented to impress one with the exceeding gravity of the problems confronting the statesmen of Russia, China, and Japan in the adjustment of their mutual relations upon the Pacific Coast. I do not know that any one has wisdom enough to say just what is best to be done. But whatever the temporary settlements may be, no permanent solution can take place that does not secure a radical modification of the social customs and the individual aims of the teeming populations of China and Japan now being permeated so rapidly by Western ideas. Western nations themselves can have little direct influence in determining the result. The alliance of England with Japan is of only passing significance.

G. Frederick Wright.

CARDINAL DUBOIS.

Paris, February 15, 1902.

It must be a subject of astonishment to see a Jesuit father, the Rev. P. Billard, put forth, in two octavo volumes, an apologia of the famous Cardinal Dubois, the minister of the Regent of Orleans. The name of Dubois is one that history has not spared, and has treated with the greatest severity. It is quite true that Father Billard does not attempt, in his 'Dubois Cardinal et Premier Ministre (1656-1723),' to rehabilitate Dubois, and to dispel all the accusations which have contrived to make his name synonymous with vice and corruption. He deals chiefly with Dubois as a statesman, a minister, and seeks to prove that, as such, he deserves more consideration than is generally paid him. The memory of Dubois has suffered much down to the present time from the judgment passed on him by Saint-Simon. The illustrious author of the 'Memoirs' hated Dubois with a perfect hatred; he could not forgive him for having risen so high from the lowest estate; he saw in the first minister an upstart, who had obtained, by his base intrigues, credit and influence which, in his opinion, belonged by right only to the princes of the blood and to the dukes and peers of the realm. His judgment was biassed in the case of Dubois as it was in the case of Colbert, in the case of Louvois.

Dubois was born in 1656 at Brive-la-Gaillarde, where his father was, some say, a doctor, others an apothecary. He got his early education at the establishment of the Doctrinaires at Brive, and finished in Paris at the Collège Saint-Michel. He remained in the capital, and made a living by giving lessons. His good fortune would have it that, after ten years spent in this way, he was appointed under-preceptor to the Duke de Chartres, the nephew of Louis XIV. He ingratiated himself with his pupil by his *esprit* and his manners, and, when the preceptor died, was appointed in his place. He secured for himself a permanent position in the Palais Royal.

Dubois used his influence with his pupil to make him consent to marry Mlle. de Blois, the illegitimate daughter of Louis XIV., a marriage which gave so much offence to the Princess Palatine, mother of the Duke d'Orléans. Dubois (who was commonly called the Abbé Dubois, though he was only tonsured and had no real ecclesiastical character) was, in the words of Saint-Simon,

"a thin little man, with a blond perruque, the expression of a ferret, a bright physiognomy, who was, to the full, what in bad French is called a *sacre*, which can hardly be expressed otherwise. All the vices strove in him for preëminence, and made a perpetual hubbub among themselves. Avarice, debauchery, ambition were his gods; perfidy, flattery, servility were his means; he rested in complete impiety and in the opinion that probity and honesty are chimeras — mere rags, which have no reality. To him all instrumentalities were good. He excelled in base intrigues, he lived in them, he could not do without them."

So Saint-Simon continues for pages, with his profuse and picturesque eloquence. He explains with equal eloquence how Dubois made himself master of the Duke of Orleans. "I confess," he says, "with bitterness, for everything must be sacrificed to the truth, the Duke d'Orléans brought into the world a yielding disposition (let us call things by their right names), a weakness, which constantly spoiled all his talents, and which was of marvellous use to his tutor during his whole life."

Having lost all hope on the side of the King, who would not even hear of Dubois being made a Cardinal, the Abbé thought only of flattering his young master. He led him into a life of pleasure, he amused him, he cultivated all his tastes, all his natural defects, his love of ease and of light conversation, his skepticism with regard to men and women alike. There is, in Father Billard's opinion, much exaggeration in Saint-Simon's accusations against Dubois. He does not believe that Dubois systematically corrupted his pupil; it is enough to know that he took no interest in his moral education, and merely thought of gaining personal advantage from his defects.

The political life of Dubois began when the Duke d'Orléans became Regent. The young King was in delicate health, and the Regent's enemies spread many rumors, which found expression in a famous pamphlet in verse, "Les Philippiques," by Lagrange-Chancel. The governor of the young King took the most jealous care of him, as if he himself suspected that the child's life was threatened. The Duke d'Anjou, who had become King of Spain under the name of Philip V., expected daily to hear of the death of Louis XV., and, notwithstanding the solemn renunciations of Utrecht, made little mystery of his intentions, and prepared to claim the throne of France. The rights of the Duke d'Orléans were threatened by these projects, which were constantly fostered by the ambition of his wife, who had absolute power over his mind. Dubois and the Regent looked for alliances against Spain, in view of certain eventualities. The Regent was very intelligent. He had a great leaning towards England. Dubois spent some time in England in 1698, and entered into relations with some of its political men. The Stuarts were the great stumbling-block for any *rapprochement* between France and England, as Louis XIV. had espoused their cause with great magnanimity, and had never abandoned them. The Regent understood that the cause of the Stuarts had become hopeless; he, however, took great precautions before declaring a new policy. He sent Dubois first, incognito, to The Hague, afterwards to Amsterdam; finally Dubois went to England, and there was signed the famous Treaty of Hanover, or the "Triple Alliance," which confirmed the stipulations that deprived Philip V. of all claim on the throne of France, and sanctioned the rights of succession of the House of Orleans. The Regent was obliged to sacrifice the Pretender and to expel him from France, as well as to destroy the works which had been begun for the creation of a port at Mardick, near Dunkirk.

The treaty negotiated by Dubois was exceedingly unpopular in France. An alliance with England, a country viewed as an hereditary enemy, a Protestant country, seemed to be a complete rupture with the traditional policy of France. People forgot all the incidents of the long struggle of France against the ambition of Spain, and did not know what dangers France incurred in consequence of the inordinate and mad ambitions of Philip V.; they did not understand that Dubois was acting the part of a real statesman, and contented themselves with saying that he had been bought by the English Government. When the character of the Spanish policy became more inimical to France and more provoking, Dubois returned to England; this time he made the journey quite officially, and negotiated the treaty of the Quadruple Alliance, between France, Holland, England, and Austria. From this time he became the real inspirer of the French policy. The post of Secretary of State for Foreign Affairs was reëstablished for him. His ties with England were such that he thanked the King of England for his promotion, writing these lines, which were significant enough: "If I followed only the impulse of my gratitude, and was not kept back by respect, I should take the liberty to write to his Britannic Majesty to thank him for the place with which Monseigneur the Regent has gratified me."

Madame, on the day when her son became Regent, asked him never to employ "ce coquin de Dubois"; and it was not till Dubois was sixty years old that he became Under-Secretary of State. He had become the master of his master. It cannot be denied that he was intelligent. "All the work of his diplomacy," says Michelet, "the purpose of his treaties of the Triple and Quadruple Alliances, was to exclude the candidates of Rome—the Pretender and the Spaniard—from the thrones of France and of England; it was to affirm or to found the Protestant dynasty and the *libertine* dynasty—the House of Hanover, the House of Orléans." He meant, however, to become a Cardinal like Mazarin; so he first asked for the Archbishopric of Cambrai, which the Regent did not dare to refuse him. Cardinal Noailles, Archbishop of Paris, was bold enough to refuse Dubois permission to receive holy orders in his

diocese. Dubois found a more willing instrument in the Archbishop of Rouen, and was ordained at Pontoise. The ceremony of the enthronization took place with great pomp at the Church of the Val-de-Grâce, in the presence of the Regent and of all the courts. One of the priests present at the ceremony was the famous preacher Massillon, who ranks, with Bossuet and Bourdaloue, among the greatest preachers of the Catholic Church. Saint-Simon tells us that "Massillon, driven to the wall, without help, felt the indignity of what was proposed to him, stammered, did not dare to refuse. But what could a man so unimportant, after the fashion of the age, have done against the Regent, his Minister, and the Cardinal de Rohan? . . . The most reasonable, who were in great numbers, contented themselves with pitying him, and it was agreed rather generally that it was in a way impossible for him to avoid the task and to refuse."

As soon as he found himself a Bishop, Dubois began to work for a Cardinal's hat. It would not be very interesting to follow him in all his intrigues. He made all sorts of promises to the Court of Rome, which he did not intend to keep. Clement XI. made him wait some time, but he was among the first cardinals created by Innocent XIII. He could now walk in the footsteps of Richelieu and Mazarin. He was declared Prime Minister in August, 1722, and, when Louis XV. attained his majority, confirmed as such. It is hardly necessary to say that he was elected a member of the French Academy. He did not enjoy all his honors, and died after great suffering on the 10th of August, 1723.

Correspondence.

THE WAR WITH SPAIN.

To the Editor of The Nation:

Sir: Your article, "The Preventable War with Spain," in the *Nation* of February 20, does the world a service. It should be read and pondered by every American citizen.

I confidently predict that, in the near future, thinking men will agree to call the butchery in the Philippines the greatest crime in history down to this time. But it began with the attack on Spain. The Anti-Imperialists began too late; they let the fire become a conflagration before they made a move to put on water. They should have got in their work in the early months of 1898. If the attack on Spain was not wrong, nothing was ever wrong; the moral law does not exist—let the grabbers grab, and the killers kill.

Nor did it need the concessions offered by Spain to make it unjustifiable. No attempt was ever made, and for a very good reason, to justify the proposed homicide by arguments addressed to the reason and conscience of mankind. The attempt to cure wrong by doing wrong, to punish murder by unlawfully killing men, can never be justified.
